52,356. How does it arise?—I think it arises from compressing an immense body of fish together. When they are compressed together in the first instance they are living, but they crush one another to death by their weight. The blood is thus driven back to the bone, to the centre of the fish.

52,357. Did you ever look at the fish caught by the two methods in order to ascertain if that objection is well founded?—I have never seen fresh trawled herrings. I have only seen them brought up from the lower waters of Loch Fyne salted. For the last 40 years I have been in the habit of sending small casks of herrings to Edinburgh and the country. Until trawling commenced I always got good herrings and I never heard a complaint, but after trawling did commence when I got trawled herrings my friends told me that they were rotten.

52,358. We shall probably be able to obtain evidence as to the curing better from some practical curer?—Certainly; but at the same time you ought to be aware that the fish buyers are curers sometimes also, and their great desire is to get fresh herrings at as cheap a rate as possible.

52,359. Can you state any other objection that is entertained by the fishermen here to the system of trawling?—There is another objection and it is this, that the fishermen have been in the habit ever since trawling commenced of getting their nets and buoys stolen. Great damage has been done among their property.

52,360. That must be when they went to the lower part of the loch, as the trawlers were not in the habit of coming up to the upper part?—For three or four years they were in the habit of coming here, and there was a great deal of damage done in that way up here.

52,361. Is there anything else?—There is the destruction of the spawn beds.

52,362. Of the spawn beds of the herring?—Yes.

52,363. Did you ever observe that yourself? Did you ever see a trawl-net employed which did actually drag up spawn or destroy spawn?—I have never seen it myself.

52,364. Has it ever been seen in this part of the loch?—I cannot tell. Some of the fishermen will be better able to speak upon that point than I can.

52,365. Is there any other point?—No, I think there is no other point. But with regard to the spawning of herrings up at the head of the loch I may say that there is a great deal of very shallow water there, and if trawl-nets were allowed to be used there they would necessarily be very destructive to the spawn.

52,366. Is it quite certain that it is a spawning ground at the head of the loch?—Yes, I think so.

52,367. It is well ascertained?—Yes, it is quite certain that they go up there to spawn, and I should just like to mention that if trawling is legalized in the upper part of Loch Fyne, or in any part of Loch Fyne, my opinion is that in three or four years there will not be a Loch Fyne herring to be got.

52,368. You think that the herrings will be destroyed if trawling is allowed in the upper part of Loch Fyne?—Yes, or in any other part.

52,369. Your reason for coming to that conclusion is that you think the ground in the upper part of Loch Fyne is a spawning bed, and that the spawn would be destroyed by trawling?—My reason for saying that is this; that if 600 boats are legalized, and can trawl all over the loch, they will commence trawling in the middle of the loch; they will then take their trawls from the middle to both sides of the loch, and it is impossible to see how a herring can escape them.

52,370. You think that the herrings in the loch would be more rapidly caught by the trawlers than by the drift-net fishermen?—In the course of one or two years I think you would see an end to the herrings altogether.

52,371. You have not stated to us what has been stated to us by others as an objection to trawling, namely, that the trawlers take immature and half-grown herrings; are you aware of that?—That I can easily understand. In all families there are both young and old, but the trawl-net takes everything while the drift-net only takes herrings of a certain size. Small herrings would pass through the mesh of the drift-net.

52,372. Are these all the objections which you entertain against trawling?—They are all the objections which occur to me at present.

52,373. Are there any other points which you desire to bring before us with regard to the state of the herring-fishing in Loch Fyne?—I think it would be a very hard thing upon a very industrious class here, who gain their livelihood by fishing, if they were to be deprived by any act of the Legislature of the fishing which has hitherto formed a great source of the income of these people. There are also many other ways by which people not personally connected with fishing itself gain a livelihood out of it. When there is anything like a tolerable fishing here there are perhaps from 20 to 40 boxes being carried away by means of carts to Loch Goil; they are handsomely paid for, and as they are only poor people who are engaged in carrying the boxes they make a very good thing out of it; but if trawling is permitted I think that in the course of two or three years the whole of that trade will be put an end to.

52,374. Are the drift-net fishermen exclusively fishermen or have they other occupations which they follow at those seasons of the year when the herring-fishing is not permitted?—With a few exceptions they are exclusively fishermen. There are a few who have little crofts; but with a very few exceptions their whole dependance is on the herrings.

52,375. Do they follow white-fishing other than the herrings?—Very few of them.

52,376. What do they do during the close season?—They have small houses with potato ground attached and they work that. They have their house and enough grass perhaps for a cow, and as much ground as will enable them to plant what the cow's manure will produce. They have each a little garden and they plant that, and that is what occupies them during the close season. I believe there is not much objection to a month being added to the open season.

52,377. With regard to the close-time, will you tell us what the general opinion of the fishermen in the upper part of Loch Fyne is as to the continuance of the close-time in the month of January?—My attention has only been drawn to the subject within the last few days, and the few fishermen I have spoken to on the matter seem to have little objection to it.

52,378. The question is not as to their having objec-

tion to it, but is there any anxiety to have the month of January as an open month?—There is not much anxiety about it because it seems that the herrings frequent the foot of the loch and the Kyles of Bute towards the mouth of January.

52,379. In December and the begining of January do they begin to leave the loch?—Yes, the upper part of the loch.

52,380. And work down towards the sea?—Yes.

52,381. Then in this part there is not very much anxiety with regard to making January an open month for the fishing?—I do not think there is.

52,382. Are the fish caught in January in good condition?—They are in good condition, but they are much smaller fish; they are not so fat; they are poor fish.

52,383. But are they good enough to be made an article of wholesome food?—Yes, quite. They are not foul at that time.

52,384. Are the numbers of that class of fishermen to whom you have just referred, and who occupy themselves during the close-time as you have described, on the increase or decrease in the upper part of Loch Fyne?—I think there has been very little change in the number during the last 20 or 30 years.

52,385. Do their sons follow the same business?—Yes, a great number of them.

52,386. In their personal circumstances are they improving or deteriorating?—They are improving, and I am glad to say that the price of the herrings is increasing. We find now that the easiness of access to Glasgow enables them to get much better prices for the herrings.

52,387. I suppose that the price depends in a very great measure on the supply?—No doubt it does.

52,388. In the year 1862, when there was so great a take in Loch Fyne, I suppose the price was much lower than it has been in other years, when there was a less favourable fishing?—There is no doubt of that. In 1862 also they ran out of salt; they were not prepared for such a fishing in the month of September. They wanted salt and the herrings necessarily came down in price.

52,389. Both the trawl and drift-net fishermen work at night?—They both work at night.

52,390. (*Mr. Lefevre.*) Do you know what the number of boats belonging to Inverary is?—No; I do not, but when you take in Inverary you may also take in the sides of the loch. Every small cottage you see is mostly a fisherman's house.

52,391. Has the number of boats increased during the last 20 years?—I don't think that the boats have decreased; I think they have rather increased in my neighbourhood; I know two or three families close to me where the father has a boat and the sons have got boats also.

52,392. Has there been an increase during the last three or four years?—I think there has been an increase within the last three or four years. I can myself speak of two families in which each has got an additional boat of late years.

52,393. Do you think there has been a general increase or not?—Judging from that I should think there would be. The fishing has been good since 1861.

52,394. Have they had a good season here so far this year?—I believe they have had a tolerable season. About 10 days ago I saw large hauls of fish got; I believe the average was thought to be 10 or 12 maze, and they were selling at 4*s.* a hundred.

52,395. Have they had a better fishing in the upper part of the loch than in the lower part this year?—I cannot speak for the lower part of the loch except that I understand they are fishing now at the bottom of the loch.

52,396. Have the boats from Tarbert been up at the top of the loch this year?—There are a good many Ardrishaig and Tarbert boats here this year.

52,397. Have you been out yourself trawling?—No.

52,398. Did you ever go down in order to observe the dead fish you have been speaking of as lying at Otter Point?—No.

52,399. Then you do not know how often it occurred, or what the number of dead fish left there was?—No, but I believe it is an admitted fact that there have been an immense number of dead fish left there.

52,400. But you never went there when you heard complaints made to ascertain from a personal inspection what the facts were?—No, it would be rather difficult to get at the bottom of Loch Fyne. I may mention it as a circumstance which I think is favourable to the fishermen of Loch Fyne that some of the fishermen of the lower loch, I have been told, have stated that they would fish with drift-nets if they had proper nets, and the fishermen of the upper loch have offered to subscribe money to buy them.

52,401. Are they not supplied with nets good enough or large enough?—The nets they have are not proper sized nets; they are not the legal net.

52,402. Do you mean the trawl-net?—Yes.

52,403. Are they not provided with the proper drift-nets?—Not the trawlers.

52,404. Then do they not fish at all?—The complaint is, that they have been deprived of fishing by the Act of Parliament, because they have not the nets which would enable them to fish, and the poor fishermen of the upper part of the loch say that they are ready to subscribe and buy them the proper nets.

52,405. I presume there are some of them who have drift-nets?—Yes.

52,406. Have those who have drift-nets been as successful as the people up here?—Yes, they have been equally as successful.

52,407. For the last four years the fishermen in the lower loch have not been able to fish with trawl-nets?—No.

52,408. Then they have been obliged to fish with the drift-net?—Yes.

52,409. Therefore they have provided themselves with drift-nets and have been fishing?—There are a good number who say they have not been able to provide themselves and that is the complaint.

52,410. Do you think that trawling in the lower part of the loch was as detrimental as trawling in the upper part?—I think that if you strew the bottom of the loch with dead fish you prevent the fish from coming up.

52,411. Do you think that trawling in the lower loch would be as detrimental to the people of Inverary as trawling in the upper part?—I don't think it would be as detrimental, because I think that if it were legalized all over the loch, you would see the end of the herring fishery here in two or three years.

52,412. If it were permitted only in the lower part of Loch Fyne how long would it then last?—That is a matter of doubt; if my theory is correct, that the dead fish lying at the bottom of the loch frighten away the living fish, the result would be almost the same; and it is my firm belief that if you legalize it for the whole of the loch, you will put an end to the fishing. I can hardly say whether you would put an end to the fishing sooner by that means than if you only allow the trawling to be carried on in a part of the loch.

52,413. You are aware that trawling did go on for many years?—Yes.

52,414. And particularly in the lower loch?—Yes, I am quite aware of that; it commenced gradually and increased; it was not very much thought of at first; it was only when it became detrimental that the thing was taken notice of.

52,415. By detrimental do you mean that less fish were caught in the whole of the loch?—The fishermen all alleged that the trawling practised by the lower loch fishermen was the cause of the shoals of fish not coming up Loch Fyne as they used to do.

52,416. They did not say that the fish were not caught, but that they were not caught by them?—The fish were not caught in the upper part of Loch Fyne.

52,417. Do the fishermen from Inverary fish more in the upper part than in the lower part of the loch; do they often go down to the lower loch?—They are

INVERARY.

P. Forbes

23 Sept. 1864.

obliged to go down in the early part of the season before the herrings come up, it is only then that they go down there.

52,418. What portion of the season do they spend in the lower part of the loch, and how much in the upper part?—They spend part of the first of the season and a good deal of the latter end of the season lower down.

52,419. Is one half of the season spent in the lower part?—I think not quite half.

52,420. A third?—Yes, fully a third of the season is spent in the lower part of the loch by the fishermen from the upper part.

52,421. During the remainder of the season do the fishermen from the lower part come up here?—Generally speaking they do, but I understand they are getting fish all down to the foot of the loch just now.

52,422. Have you observed any improvement in the fishing for other fish than herring during the last four years?—I cannot say that I have.

52,423. When did you observe the decrease first take place?—It has been decreasing gradually I may say for 20 years; we first attributed it to the immense quantities of long-lines that were set down at the foot of the loch by the Greenock and Rothesay fishermen; we attributed it first to that cause, but whether that was right or wrong I cannot say.

52,424. Did you observe the decrease of the haddock or whiting at any particular time more than other fish?—No, I cannot say that I did.

52,425. How many men are there fishing from here with lines during the close-season?—There is a mode of fishing they have here with a small net.

52,426. With trammel-nets?—No, it is a small kind of net in which the white-fish are entangled; the fishermen catch a good many in that way; I have seen them take up dozens of very nice haddocks.

52,427. Do they not fish with lines here?—There are line fishermen.

52,428. How many?—I do not know.

52,429. Do you recollect how many there were 20 years ago?—No, but I do not think there has been much decrease.

52,430. Before the close-time was observed here, were the fishermen in the habit of fishing during the months now set apart as close-months?—No, the fishermen here generally ceased fishing I think almost always before Christmas.

52,431. Even before a close-time was enacted by law?—Yes, before a close-time was enacted.

52,432. Then do you approve of the observance of close-time?—Certainly.

52,433. Upon the ground that it protects the fish during the spawning time?—Yes, and it gives the fish quietness and peace for a certain time.

52,434. Do you think the herrings mostly spawn during those months?—I cannot tell exactly whether they spawn or not during those months. I daresay that the herrings are in a great measure out at sea in those months.

52,435. They are not in the loch?—Not in the upper part of the loch.

52,436. Have you observed any spent fish taken during what is called the open-season?—I have not seen many spent fish at all this year. I never saw fewer foul fish than I have this year.

52,437. Have you in other years observed any number?—The close-time has only been established three or four years; but since it has been established we have seen very few foul fish in comparison with what we used to see.

52,438. When did you see plenty of foul fish?—Twenty or 30 years ago we saw immense quantities of foul fish.

52,439. During what month of the year?—During this month. From the middle of August up to the middle of September.

52,440. For the last 20 years you have not observed many spent fish?—I have not observed many for the last four years.

52,441. Twenty years ago you observed great numbers?—Yes; for a period of a dozen years we considered that our fishing was destroyed here by the trawling carried on down in the loch and we had very little fishing up here at all.

52,442. (*Mr. Caird.*) Has there been any change in the opinion of the fishermen generally in regard to the question of trawling within the last two or three years in this part of the loch?—The only thing that has taken place, so far as I understand, is that the fishermen in the lower loch have come round to our opinion, that drift-net fishing is the best mode of fishing.

52,443. Are you sure that that is the case?—I do not say that the whole of them have; but a great number of them, such as the Ardrishaig and Loch Gilp fishermen have come to that conclusion, that the drift-net fishing is the best mode.

52,444. There has been no change of opinion in the upper part of the loch as to the disadvantages of trawling?—There has been no change of opinion in that respect; on the contrary I believe it is more confirmed. The fishermen have become more confirmed in opinion with regard to the injury done by trawling.

The witness withdrew.

J. Munro.

JOHN MUNRO called and examined.

52,445. (*Mr. Caird.*) Have you been for some years a fisherman in Loch Fyne?—Yes.

52,446. And you are well acquainted with the state of the fishing interest here?—Yes.

52,447. Have you ever been a fisherman of any other kind of white fish except herrings?—No.

52,448. You have been exclusively a herring fisherman?—Yes.

52,449. And a drift-net herring fisherman?—Yes.

52,450. Have you ever seen the trawl at work?—Yes, often.

52,451. Are you in the habit of fishing below Otter Point?—Yes.

52,452. Do you fish in any part of the loch where you find the herrings are likely to be taken?—Yes.

52,453. Do you always fish in the upper part when there are fish there?—Yes; we fish in any part where we expect the fish to be.

52,454. The season commences in the beginning of June?—Yes.

52,455. Have you found any difference as to one locality of the loch in the different months of the fishing season being more favourable than another?—I cannot say anything as to that. We just go to whatever place we think the fish are, and where the body of them are likely to be found.

52,456. Where do you fish when the fishing begins in June?—We fish then outside.

52,457. In the lower part of the loch?—Yes, between Tarbert and Campbeltown for a month or two.

52,458. In June and July?—Yes.

52,459. As the season goes on do the fish enter the loch?—Yes, as the year comes round.

52,460. In what month of the year do you generally find the best fishing in Loch Fyne?—In August or September, sooner or later.

52,461. Are the fish in the best condition then?—Yes, that is the best time for finding the fish in a good condition.

52,462. In what part of the loch do you generally find the largest hauls at that time of the year?—We generally get the largest hauls at the head of the loch; but there is a pretty good fishing all down the loch when there is a good body of fish. The heaviest hauls are taken, however, at the head of the loch in the shallow water.

52,463. Do the fishermen from the lower part of

the loch congregate upon the same ground at that time ?—Yes.

52,464. So that you often have a large number of boats fishing together ?—Yes, sometimes from 500 to 600 boats.

52,465. All of them fishing in a very small range of water ?—Yes, within a distance of three miles, or less than that at times.

52,466. Will there be as many as between 500 and 600 boats ?—Yes.

52,467. We understand the usual length of the drift of nets of a fishing boat is about 1,400 yards ?—Some are longer and some are shorter. The large boats have them longer than that, and the small boats shorter.

52,468. Will 1,400 yards be about the average for the whole ?—Taking the whole of them they will not average that length.

52,469. The average length will be less than that ?—Yes.

52,470. Then there must be a vast quantity of lines and nets stretched backwards and forwards in a limited space in the place where you expect to get a good fishing ?—Yes, they are very thick together.

52,471. Is it deep water where you fish ?—It is not very deep at the head of the loch, but it is deep down along here.

52,472. How deep will it be at the head of the loch when you get in such close quarters as you have mentioned ?—We get them in water only the depth of our nets sometimes, and sometimes in deeper water. We can all shoot our nets in the shallow water ; and as many as can go as far in upon the shallow ground as possible, in order to get the best shots, for it is believed that in the shallow water the fish kill better.

52,473. Are there more fish got in the shallow water ?—Yes.

52,474. Are the fish supposed to be lying at the bottom when you go out to set your nets ?—Yes, they are often at the bottom and we find them at the bottom. In some months of the year they are at the very bottom and we put our nets down to the bottom in order to take them.

52,475. Do you sink your nets ?—Yes.

52,476. How do you ascertain that they are at the bottom ?—We know by the appearance, and when we do not find them above we expect to find them below.

52,477. (*Mr. Lefevre.*) In what month is that the case ?—Generally in August and September.

52,478. (*Mr. Caird.*) You sink your nets then ?—Yes, and often before then.

52,479. What depth is the top rope of the net from the bottom of the water ?—We generally put out from 60 to 65 fathoms here. The top rope may be that distance from the surface.

52,480. Then an immense shoal of fish might swim between the top of your net and the surface of the water ?—Yes, but at times the fish lie at the bottom of the water and will not kill anywhere else.

52,481. From your practical knowledge and experience you know the depth you shoot in one night after another ?—Yes.

52,482. What is the least depth from the surface in which you sometimes shoot your nets ?—Sometimes as low as a foot.

52,483. That depends on the shallowness of the water in which you are ?—Partly. Sometimes the fish swim very high on the surface and at other times they are on the bottom. We put the string out as we think the fish swim. The fishermen have generally about two fathoms of string which is about 12 feet.

52,484. Upon the average you put out two fathoms of string ?—Yes.

52,485. But sometimes you put out more and sometimes less ?—Yes, but upon the average we work with about two fathoms.

52,486. Do you observe any rule among yourselves or is there any regulation enforced here as to the time at which you shall shoot your nets ?—Yes, there is a set time for shooting our nets.

52,487. What is that time ?—Half an hour after sunset.

52,488. Is the rule strictly observed ?—Not very strictly here. It was once but that has not been the case for the last few years.

52,489. Is it not a legal regulation of any kind ?—I suppose it is. At the time the Fishery cutter was here waiting upon the fishing that was the rule. They went out every night and fired a shot before the fishermen shot their nets.

52,490. Was it the rule as it was then enforced that you should not shoot your nets until half an hour after sunset or half an hour before ?—I believe an hour after.

52,491. You say that no such rule has been lately enforced among you ?—No.

52,492. Has it been observed as a matter of convenience among yourselves ?—Yes ; some keep it as carefully as when the Fishery cutter was here, but others do not attend as well to it.

52,493. Is there any hardship felt by the general body of fishermen in consequence of the want of such a regulation ?—Yes ; I think it would be a great improvement to the fishing if that regulation was kept well enforced.

52,494. To prevent shooting till after sunset ?—Yes; where there are a body of fishermen some become unruly and that leads to much harm being done.

52,495. What harm have you ever seen result from shooting your nets before sunset ?—We consider that it scares the fish and puts it more deep into the water.

52,496. It prevents them from rising in the water ?—Yes.

52,497. Do the fish in general not rise high towards the surface ?—Sometimes they rise high but it is very seldom in the daylight. In the evening and in the morning they are more ready to rise to the surface.

52,498. And during the night?—Sometimes through the night they rise ; perhaps at the rise of the moon. If the moon rises in the night the fish rise and play on the water, and at other times the same thing will occur at the setting of the moon or at the turning of the tide.

52,499. Would you consider it injurious to the fishing in Loch Fyne if the fishermen were allowed to shoot their nets during the daytime ?—Yes, I consider that that would be very injurious to the fishing.

52,500. Is it at all likely that they would be successful if they did so ?—No, it is not likely that they would be.

52,501. Are they at all desirous of having a change of that kind or not ?—No.

52,502. Have you noticed the large fish to which reference was made by the previous witness which he said are seldom caught by the drift-nets, and which lead the shoals ?—Yes, they are what we fishermen call ground keepers.

52,503. Have you observed whether these large fish come in at any particular season or whether they come at all seasons during the whole time the fishing is going on ?—They come before any other body of fish come in. We consider that they are the leaders of the fish.

52,504. The leaders of the fish at the commencement of the season ?—Yes.

52,505. But after the commencement of the season do not the shoals of fish continue to come into the loch ?—After a certain season of the year there are no fish coming in.

52,506. You told us that at the beginning of the season of the year you fish out in the outer loch and as far as Campbeltown ?—Yes.

52,507. Have you observed the progress of the fish towards the loch as they come in from the open sea ?—Yes.

52,508. Do the shoals always come from the westward ?—Yes, but there are times when we consider that they come from the south as well as from the west.

52,509. Down the Irish Channel ?—We expect to

INVERARY.

J. Munro.

23 Sept. 1864.

meet them coming down from Campbeltown by Ailsa Craig.

52,510. You think they come that way?—I am sure some of them come that way.

52,511. And some from the north?—Yes.

52,512. Do you expect them principally from the north and south?—Yes.

52,513. When do they first make their appearance coming either from the north or south?—Some of them sooner, some of them later. They do not come at the same time every year.

52,514. You do not begin to fish until the month of June?—No, there is seldom anything before that.

52,515. Do you then begin to observe the fish?—Yes.

52,516. Then do they hold a pretty regular course for Loch Fyne?—No, sometimes they make rapidly for the loch, but at other times their movement is slower and takes more time.

52,517. Do they come in in repeated shoals or in one great shoal at one time?—They come in shoals, perhaps in three or four different shoals throughout the year.

52,518. Throughout the year?—Yes, through the season of the fishing.

52,519. With some interval of time between?—Yes.

52,520. How long is the interval?—Sometimes more and sometimes less; sometimes a month and sometimes less; sometimes there is only one shoal that comes at all.

52,521. Will that be an unfavourable fishing here?—Sometimes there will be so large a body of fish in one shoal that there will be plenty for the whole of the loch.

52,522. For the whole seven months of the fishery?—Yes.

52,523. Does it remain in the loch during the whole fishing season?—Yes, only it goes backward and forward; it takes its course up and down the loch.

52,524. But it does not leave it?—It very seldom leaves the loch until the month of September.

52,525. Then is it found to leave it?—It sometimes leaves it early in the season.

52,526. In what direction does it go out?—It goes out in the same direction as it came in, but it may stop for a month or two at Tarbert or Loch Gilp.

52,527. Where do the fish spawn?—We consider that a good many of them spawn on the banks at the head of the loch.

52,528. During the fishing season?—Yes.

52,529. When they are in the loch?—Yes; there are some bays and points where we consider they spawn especially at the head of the loch.

52,530. Do you consider that the larger portion of the fish spawns in Loch Fyne?—No.

52,531. Where do they spawn?—The larger portion spawns at Ballantrae.

52,532. Do you suppose that that is constant?—No, we think that it is done away with now.

52,533. Is that in consequence of the fish being much fished in those beds in the spawning season?—Yes.

52,534. That has been put a stop to by the present state of the law?—Yes, but we suppose that the fish do not frequent those grounds for the purpose of spawning as they were scared off before.

52,535. Do you suppose that they go out to the open sea?—Yes, but we do not know where.

52,536. With regard to the spawning beds at Ballantrae, we have been given to understand that there has been no fishing on those beds since the late law was passed establishing a close-time. There is none of the fishing continued now I suppose?—No, it has been destroyed.

52,537. But you have had one large fishing in Loch Fyne since then?—Yes.

52,538. Then it would appear that whatever destruction may have taken place by the previous fishing on that bed the effects of it had not continued, inasmuch as you have had a successful fishing since?—We considered that most of the young fish were reared here for two or three years before the herring-fishing commenced. There was a large body of small fish here and they grew up until the year in which the great fishing took place. Occasionally we used to catch a few of them but they were of no size. We thought that most of the body of fish that was caught here were reared here.

52,539. Caught in 1862?—Yes.

52,540. There has been no trawling since then?—No.

52,541. Then there has been nothing done which would have prevented that large body from increasing?—No.

52,542. But still, you have not had such a good fishing since?—No, but sometimes the fishing is on the decline while at other times it is increasing for different reasons.

52,543. Do you suppose that it depends more on the weight of the shoals that come in from the open sea than upon any other circumstance?—Yes, I think a good fishing does depend upon that.

52,544. Have you any doubt upon that point?—No, I have not.

52,545. With regard to the question of the size of the mesh of your nets, are you pretty uniform in your drift-nets as to the size of the mesh?—Yes; we have them always above an inch.

52,546. You never have them below an inch mesh?—No, they would not do for us if they were below an inch mesh.

52,547. Does anybody here look after the nets to see that that is observed?—No, there is no one here that looks after that.

52,548. Is there any officer here whose business it is to inspect the nets and to look after such matters?—I suppose it is the duty of the Fishery officer to look after matters of that sort, but there is no one here who comes to look after the nets very often.

52,549. Is that a matter which is left very much to the fishermen to regulate for themselves?—Yes, but it is of no benefit to the fishermen to have their nets under an inch mesh.

52,550. Does that enable them to get a better class of fish?—Yes, it does.

52,551. Then has it had the effect here of inducing the fishermen to have their nets rather over an inch mesh than under?—Yes; they consider that if the nets are smaller or less than an inch in the mesh they are not as profitable to them.

52,552. Do they change their nets in different parts of the season?—Yes.

52,553. Do they use nets of the full size in a certain part of the season and the older nets of a smaller size which have become shrunken from use in another part of the season?—They use the old nets in the latter part of the season.

52,554. Why is that done?—Partly to keep their new nets in better order and partly because the fish are smaller at the time and the old nets are better adapted for such fish.

52,555. The old nets are better adapted for such small fish?—Yes.

52,556. What is the size of the mesh of the old nets?—There are none of them less than an inch in the mesh and all of them being of an inch mesh the fish they catch cannot be very small.

52,557. Of course you have had your attention directed to the question of trawling, which so much interests the fishermen of Loch Fyne?—Yes, I have.

52,558. You heard the evidence of the previous witness?—Yes.

52,559. Do you agree with his statement, that there has been very little trawling to speak of in the upper and narrow parts of Loch Fyne?—There has been very little trawling done here and especially by the people of this place. There have been people from other places who have been trawling here, but there have been very few belonging to this part of the loch.

52,560. Is the upper part of Loch Fyne less adapted for trawling than the lower part?—I think it might do as well for trawling as any other part.

52,561. Would trawling be as easily carried on here as in any other part of Loch Fyne?—Yes, especially at the head of the loch, but down along the coast the shores are very bold and the ground is very coarse, so that if they did not trawl in the middle of the loch or at some distance from the sides they could not take their trawls close to the shore.

52,562. Are you speaking now of the narrow parts of the loch?—No, I am speaking of the middle of the loch. There is very coarse ground all over the loch, except in some spots.

52,563. But, on the whole, both the upper and lower parts of the loch are equally well adapted for the use of the trawl?—No, they are not so well adapted for it. At the very end of the upper part of the loch they could shoot the trawl-net because the shores are smooth and they could take the trawls on shore.

52,564. That is very limited ground, is it not?—Yes, there is not very much of it.

52,565. And that is also the ground upon which the fish go to spawn, is it not?—Yes, it is, but down along the coast the shore is very steep and bold and coarse, so that the trawl-net fishermen could not take their trawls close to the shore as they would wish to do.

52,566. They trawl in shallow water if they can?—Yes.

52,567. Then we may take it, that in the upper part of Loch Fyne except in one place, and that being of a very limited extent, the ground is naturally not so well adapted for the use of the trawl-net as the lower part of the loch?—No; there is more ground upon which they can trawl in the lower part of the loch than in the upper part.

52,568. Have any of the fishermen of the upper part thought it of advantage to use the trawl-net during some portion of the season and to fish with the drift-net when they considered that that would be more advantageous?—No, they do not use the trawl-net here at all.

52,569. They do not think it would be of advantage to themselves to use the trawl-net?—They consider that the trawl would not do at all for them. The trawl is a thing which is drawn through the water with violence, and if there were any person fishing with a drift-net at the time a trawl-net was being used the trawl-net would necessarily destroy the fishing.

52,570. There can be no necessity in the case; the trawl-nets would not destroy the drift-nets if they kept clear of them?—Any net that is drawn through the water must come in contact with a net lying still on the top of the water.

52,571. The drift-nets are all marked with buoys?—Yes, they are.

52,572. Would not a trawl fisherman in trawling a circle-net keep clear of the drift-net fisherman?—No, I think it is impossible that he could keep clear of the drift-nets.

52,573. Would it not be possible for the trawl fisherman to go to such a position as would enable him to make a circle and keep clear of the drift-nets?—The drift-nets are so close to one another that if I were fishing with a trawl-net before I could draw the net out of the way I should be foul of some of the trains.

52,574. In the lower part of the loch where there are waters that are shallow and not so confined would you be able to find room between the drift-nets and the shore to make a circle with the trawl?—At times that could be done but not always.

52,575. But in the upper part of the loch you say that that is not so practicable?—No, it is not.

52,576. Then in the whole of Loch Fyne there is no part except the upper part of it that could not be fished with the trawl-net thoroughly, missing no portion all the way along?—The trawl might do well in the upper part of the loch, but the place is so narrow that the drift-nets could not work at the same time the trawling was being carried on.

52,577. The whole of the upper part can be fished with drift-nets?—Yes.

52,578. The trawlers would not fish as well in the upper part as in the lower part of the loch?—No.

52,579. On account of the drift-net fishermen?—Yes.

52,580. There is more room for them in the lower part of the loch?—Yes; there is no room for them at all in the upper part of the loch when the drift-nets are there. The drift-nets will take the whole breadth of the loch.

52,581. Then the first objection you have stated to us is that in the upper part of the loch it would be impossible to use the circle-net without fouling the drift-nets?—Yes, that is my opinion.

52,582. But that objection would not hold good in the lower part of the loch?—No.

52,583. What is your next objection?—We consider that the trawl-net and the drift-net will not work together in any place on this coast; we have tried it often and have got our nets destroyed so frequently that we consider that it will not do at all to have both kinds of fishing going on at the same time. We must do away either with the drift-net or the trawl-net; they cannot work in the same waters, the drift-net and the trawl.

52,584. I thought you stated in answer to a previous question that in the lower part of the loch it may be done, in the shallower bays to which the drift-net fishing does not extend?—Yes, it may be done at times.

52,585. Why do you say "at times?"—Sometimes the drift-net fishermen shoot their nets so close in-shore that it is impossible for the trawlers to trawl inside.

52,586. You mean that the drift fishermen do not leave the trawlers sufficient room to trawl?—Yes.

52,587. You go close in-shore?—Yes.

52,588. How close in-shore do you go?—We go so close to the shore that we get in water which is only the depth of our nets, and it would be impossible for the trawlers to trawl inside of us without injuring their nets or ours.

52,589. Not unless it was in a very shallow bay?—The nets they use are fully as deep or deeper than ours and they could not work inside of us. We have to shift our ground at the time that trawling is going on and we leave the ground to those who are engaged in trawling.

52,590. Did you do that if there was a good fishing at the time?—Yes, we were obliged to do so, even supposing we knew that there were plenty of fish to be got there.

52,591. Why did you do so?—Because we have suffered so much in consequence of the trawlers coming in contact with our drift-nets.

52,592. (*Mr. Lefevre.*) What interval ought there to be between the drift-nets and the shore so that it would be possible to work without getting foul of the drift-nets; what space of room ought there to be left?—I cannot say that, but I know that as a general rule they have from 200 to 400 yards in connexion with their trawls. They draw their trawl-nets over that length and sometimes more, and that is a long space.

52,593. From 200 to 400 yards?—Yes.

52,594. (*Mr. Caird.*) Will you tell us what your next objection is against trawling?—My next objection to trawling is that we consider it would not do for the great body of fishermen in different ways. Suppose, for instance, that they did a little trawling in the way of smuggling.

52,595. Do not talk of smuggling, but take it for granted that trawling was rendered legal.—If there were only a few men working at it at a time they might probably get a little by it, but if the great body of the fishermen were to take to trawling it would be impossible for them to work in such narrow waters as those of Loch Fyne.

INVERARY.

J. Munro.

23 Sept. 1864.

52,596. You think there would not be room for all the fishermen if the whole of them took to trawling ?—Yes.

52,597. Do you think that if trawling were legalized the great body of the fishermen would take to trawling ?—No, I do not think they would.

52,598. Why would they not ?—If they did they would do away with the whole of the fishing in the loch in the course of a very few weeks.

52,599. I thought you said that if trawling were legalized here the great body of the fishermen would take to it and it would become hurtful to the fisheries?—Yes.

52,600. But would the great body of the fishermen be likely to take to it ?—If they did I believe they would destroy the fishing in a very short time.

52,601. Then why would the great body of the fishermen be likely to take to that sort of fishing ?—I think they would see very plainly that it would not do. Their occupation would be done away with altogether.

52,602. I understood you to say just now that if trawling was legalized in Loch Fyne the great body of the fishermen who would then take to trawling would soon extinguish the fish ?—Not at all. I did not mean to say that. I never thought of anything of the kind.

52,603. Then I misunderstood you ?—Certainly. I never meant to say that. What I meant to say was, that if trawling were allowed, and the great body of the fishermen were to take to it the whole of the fishing in the loch would be done away with in the course of a very few months.

52,604. You think that would be the result if the great body of the fishermen began trawling ?—Yes.

52,605. But why would they begin a system of fishing which you yourself say the fishermen do not think is a good system ?—They would only do it if they were forced to do it.

52,606. If they were forced to do it ?—Yes.

52,607. Why should they be forced to do it ?—That is another thing. I do not think they ought to be forced to do it.

52,608. If trawling were permitted by the law that would not force them to do it ?—Trawling is not permitted by the law now.

52,609. But if it were permitted by the law they would not be forced to change their present mode of fishing ?—At present their only occupation and means of obtaining a livelihood is fishing. They must follow something, and it is only natural to think that they would try this mode of fishing more than anything else.

52,610. Do you mean that those who have already tried trawling would go back to it if they were permitted to do so by the law ?—Yes.

52,611. There have been several specific objections made to the use of the trawl upon which we should be glad to hear your opinion ?—I shall be glad to tell you anything I can.

52,612. There was a petition presented from the fishermen of Inverary against trawling ?—Yes.

52,613. In that petition there are several distinct objections urged against trawling ?—Yes.

52,614. The first of those objections is that herrings which are immature and half grown, in great numbers, and altogether unfit for human food, are taken by the trawl-net ?—Yes.

52,615. You know that to be the case ?—Yes.

52,616. Very small fish unfit for consumption have been taken ?—Yes.

52,617. Had that fact any reference to the time when there was no close-season ; were the small fish you speak of taken in those months which are now close-months and in which no fishing is allowed ?—Yes ; that was the time when the trawl was wrought.

52,618. And it was at that time that immature fish were taken ?—Yes.

52,619. But there being now a close-time strictly observed and no fishing being permitted during those months, would the same objection, in your opinion, still apply to the use of the trawl-net ?—Yes, I think it would.

52,620. Do you tell us that during the present time of fishing if the trawl-net were used it would take a great quantity of small and immature fish ?—Yes.

52,621. Would it take a great quantity of small herrings ?—Yes, it would take every kind of fish that came across it.

52,622. Have you ever seen it used yourself ?—Yes, I have.

52,623. Would it not depend upon the size of the mesh of the trawl-net whether it took small fish or not ?—Not a great deal. It does not depend on the size of the mesh at all because the fish when they are surrounded by the trawl-net are packed close together as if they were in a bag. They draw it through the water with all that quantity of fish in it and they are as ready to go across the mesh as to go headlong into it ; of course if they do that they equally stop up the mesh and prevent any other fish from passing through. They shut up the mesh entirely and the net carries the whole body of the fish before it.

52,624. Do you mean that the meshes of the net are not shut, but that they are blocked up by the quantity of herrings in the net ?—They are blocked up and shut together by the quantity of fish which are being taken through the water.

52,625. Have you noticed when the circle-net has been drawn in that quantities of small fish do escape ?—I never saw them escaping.

52,626. Have you ever seen them getting out ?—No, but I have often seen them taken ashore.

52,627. Was there a large quantity of small fish ?—Yes.

52,628. That was during the open season ?—Yes.

52,629. The second objection contained in the petition from the fishermen of Inverary is that the trawl-net breaks up and separates the shoals of herring and drives them from their usual spawning grounds. What is your opinion upon that point ?—It is still my opinion that it does so.

52,630. Does the trawl-net do that more than the drift-net ?—Yes, it is only natural to suppose that it does.

52,631. If they were in equal numbers fishing would the trawl-nets break up and separate the shoals of herring more than the drift-nets ?—Yes ; one trawl-net would hurt a body of fish more than a hundred drift-nets.

52,632. Can you give us any reason for that ?—The trawl-net takes whatever wing of the fish it gets around ; it takes the whole wing with it. It breaks up the main body of the fish, takes an entire wing, and frightens and scares away the rest. The shoal does not continue in the same course which it was making before its progress was intercepted by the trawl-net.

52,633. The shoal of herrings, in your opinion, does not continue on the same course ?—No, I think not.

52,634. Where do they go ?—They turn back.

52,635. If you have your nets set in a certain part of the loch, and there is a space between the end of your nets and the shore in which it is possible to use a trawl-net, suppose that the trawl-net in coming round takes the end of the shoal in the way you have mentioned and frightens away the rest of the shoal, would not the herrings be driven against your drift-nets ?—That was sometimes the case. Sometimes the fishermen who were working with drift-nets got a very good fishing while they were near those who were trawling.

52,636. Was that of frequent occurrence ?—No, it was very seldom ; sometimes they would come into the drift-nets after they were scared away by the trawl.

52,637. Where could they go if they did not find their way into your nets ?—They were frightened away and would turn back.

52,638. But you say that the drift-net boats would be in a thick close body all around the place?—Yes.

52,639. Then if you were in that thick close body all around the fishing grounds, where could the herrings go after they were scared away, as you state, from the trawl-nets?—I do not know.

52,640. Suppose there were 500 or 600 boats upon the ground where the herrings were; that would frequently be the case, would it not?—Yes.

52,641. And they would cover an average space of three or four miles in breadth?—Yes.

52,642. Then suppose that there was a little space left between the shore and the end of your drift-nets that could be fished by the trawlers with their circle-nets, if those circle nets had the effect of disturbing and breaking the shoals of fish, would not the result be that the herrings would be driven against your drift-nets?—No.

52,643. Then where would they go; I want to understand what would become of them?—The trawl-net would break the shoal, frighten the fish, and they would go away.

52,644. But where would they go?—They would go to the bottom.

52,645. In that way would they get away altogether?—Yes.

52,646. How?—The bottom is deep and they could swim across, our nets being above them. They would have different ways to go.

52,647. But still they would be dispersed outwards, towards the drift-nets?—Yes, whatever was left of them would be.

52,648. A considerable portion of them would be taken by the trawl-nets?—Yes.

52,649. Where would the rest of the body go?—They would go away to different places, of course I cannot give an account of where they would go, but whenever such a thing has occurred when trawling was allowed in the loch, we have always felt that the fishing was greatly behind afterwards.

52,650. Did you ever get a good fishing after the shoal of fish had been disturbed by a portion of it being taken in the trawl-nets?—No.

52,651. The third objection which appears to be made by the Inverary fishermen in their petition is that the trawl-nets ruin and destroy the spawning beds of all the fish by dragging up the spawn?—Yes.

52,652. Do you agree with that statement?—Yes.

52,653. Have you seen the trawl-nets used upon the beds on which the herrings spawn in the loch?—No, because we are not certain where the spawning beds are lying.

52,654. Then how do you know that the trawl-nets ruin the spawning beds, and drag up all the spawn?—We know that the least thing will spoil a spawning bed.

52,655. Did you ever see any spawn in the circle-nets?—No.

52,656. Then in point of fact, in assenting to this objection, you are merely expressing an opinion?—Yes, that is all.

52,657. There is nothing which you have experienced which enables you to say positively that it is the fact?—We know by the weight at the bottom of the trawl-nets that when they are being dragged over the spawning beds they must injure them.

52,658. You think that it must injure the spawning beds if it passes over them?—Yes.

52,659. There is another objection also stated in this petition, namely, that the trawl-nets injure the herrings taken by them so materially as to render them unfit for curing for exportation; do you agree with that assertion?—Yes, I quite agree with it.

52,660. You have seen them cured and sent away, have you not?—Yes, I have.

52,661. In what respect do herrings caught by the trawl-net and cured differ from those which are cured after having been caught in the drift-net?—They do not cure as well.

52,662. In what way are they inferior?—They have not the same taste.

52,663. Is there any other difference; can a trawled herring be distinguished from a drift-net herring by its appearance as soon as it is seen?—Yes.

52,664. What is the difference?—The cured herrings which have been caught in the trawl-net are always black about the bone; they salt well enough but they have not the same taste as the drift-net herrings.

52,665. Do they not bring the same price?—No, they do not.

52,666. Are they not taken by the curers as readily for the purposes of cure?—Not if they can get net-caught herrings.

52,667. What, on the average, has been the difference between the price of the herrings caught in the trawl-nets, and the drift-net herrings?—Between 5*s.* and 10*s.*; it is sometimes higher and sometimes lower.

52,668. Is it between 5*s.* and 10*s.* a maze?—No, per barrel.

52,669. There is a difference in the price of between 5*s.* and 10*s.* per barrel?—Yes, there is that difference in the herrings caught in the trawls as compared with those taken in the drift-nets.

52,670. (*Mr. Lefevre.*) Was there that difference when fish were brought in by the drift-net fishermen and by the trawl fishermen at the same time?—The difference was not so great when they were sold fresh.

52,671. What was the difference when the two descriptions of fish were brought in at the same time, and sold fresh?—There was not much difference in that case.

52,672. What was the difference?—Perhaps about 6*d.* a hundred.

52,673. (*Mr. Caird.*) Then the difference in the price of the trawled herring as compared with that of the drift herring is not so great when they are sold fresh?—No.

52,674. It would appear from that that the trawled herrings are better adapted for the fresh market?—Yes.

52,675. This memorial states that a very great number of the herrings killed by the trawl are entirely lost and left in the sea to rot?—Yes.

52,676. Have you seen that occur frequently?—Yes.

52,677. At the time when trawling was permitted and not when it was done as it were by stealth?—I have seen the trawls break, and they had then to leave the fish, and it could be seen in a large body in the deep. It has been left there in a large body, dead, and lying on the ground; I have seen that often.

52,678. (*Mr. Lefevre.*) That was when the trawl broke?—Yes.

52,679. (*Mr. Caird.*) That is not a matter of frequent occurrence?—Yes, I have seen it often, and I should mention that when I have seen it the fishermen have taken some barrels of herrings from the bulk at the bottom.

52,680. Were the fish dead?—Yes.

52,681. Were they lying dead at the time?—Yes.

52,682. How long ago is that?—I daresay it is eight or nine years since I saw the last of it.

52,683. Is the last time you saw such a thing eight or nine years ago?—Yes, that was the last time I saw it.

52,683*a*. Has there been much or anything of the kind in more recent years than eight or nine years ago?—I suppose it has been the case all along, only I did not see it at all times. I have not seen it since eight or nine years ago but I often saw it before.

52,684. How many instances have you seen in which that has happened?—I could mention four or five at least.

52,685. In the course of your experience?—Yes, or more.

52,686. (*Mr. Lefevre.*) Was the take of fish so very great that it was too much for the men?—Yes.

52,687. Was it too great a weight of fish?—Yes, and if there was a small part of their net that was weaker than another part, it would give way; they would go out through a very small hole, just as if it was a hole in a riddle.

INVERARY.

J. Munro.

23 Sept. 1864.

52,688. Then that great body of fish would escape?—Yes.

52,689. Would the great body escape alive?—No; when they are once caught in a trawl they are so close together that the one kills the other, and they are quite dead in a short time; they are useless after they have been all together in a small space.

52,690. Are they dead before they come into the boat?—Yes.

52,691. They are generally dead?—Yes.

52,692. Have you always observed that?—Yes, they may come to the boat at times living, but if they were let go they would not swim; they would float on the surface or drop to the bottom.

52,693. (*Mr. Caird.*) Then this petition says that from the manner in which the trawl is wrought the drift-nets are torn and destroyed?—Yes.

52,694. That you say is when they have been fishing in too great proximity the one to the other?—Yes, in the same waters they do not work well together.

52,695. Are you aware that many of the fishermen of Ardrishaig have adopted the system of fishing with drift-nets when they thought it most advantageous, and have taken to trawling if the fish did not mesh well in their nets?—There was a certain number but I am not sure how many.

52,696. As a practical fisherman, can you say that there are certain times when, although you know there are fish in the loch, they will not mesh in your nets?—Yes.

52,697. That is the fact?—Yes.

52,698. Would they not be advantageously caught and a regular supply of fish sent to the market by using the trawl-net at such times as the fish will not mesh in the drift-nets?—I do not know there is any way we know of yet by which we could catch fish at our own will.

52,699. I thought you agreed that there are times, certain times I suppose, in which the fish do not seem inclined to mesh in the drift-nets?—Yes.

52,700. And you, although you know the fish are there, cannot catch them?—Yes.

52,701. Is it the case at such times that the trawl fishermen can catch them?—No, they cannot catch them either.

52,702. At the same time?—Yes, we have seen that often.

52,703. Do you know what the reason is?—I never tried trawling for herrings myself, but I have seen some of my neighbours try it, when they would not come into the drift-nets, and they were not able to get them any more than ourselves.

52,704. (*Mr. Lefevre.*) Have you ever known a time when the trawl fishermen would catch fish and you would not?—Yes.

52,705. What was the reason of that?—If they got a body of fish close to the shore they would bring both ends of the nets close to the shore and force them in. That is not our mode of fishing. We let our nets go with the tide; whereas, they haul them on shore.

52,706. Have you ever taken your own nets near to the shore, leaving room for a trawl-net to work; and have you seen the trawl-net then taking fish inside your nets when you have not been catching them yourself?—If we had set our nets as close to the shore as we wished they would not have had room to work inside of us.

52,707. But where there has been room for a trawl to work inside, have you ever known it to be the case that you have not caught fish and yet the trawlers have?—Yes.

52,708.—What reason do you give for that?—The fish were forced or drawn to the shore. The trawl was put round about them and they were forced to the shore so that they could not escape.

52,709. But there must have been fish all round near your nets, only that they would not mesh themselves?—Yes, but perhaps the body of the fish was lying close to the shore.

52,710. Then you admit the fact that by that mode of fishing fish may be taken by the trawl when you are not successful in catching them yourselves?—Yes, at certain times.

52,711. Then would it be of advantage to yourself, as a fisherman, that you should have the option of using that which you say at times is a more successful mode of fishing than you find the drift-net fishing to be?—No, I think it would do more injury to the fishing than good.

52,712. Explain how it would do so?—I consider that it would do injury in this way: if I had got liberty to use that net, it is most likely that others would have liberty to use it as well as me. Then the whole body of the fishermen must try at that mode of fishing, and we could not work together. It would be impossible for us to work together in the same waters. Our very neighbours could not agree with one another.

52,713. Would they come more in contact by the use of that net than by the use of the drift-net?—Yes, because the drift-net lies still in the water, while the other net is drawn through the water. If my neighbour and I were trawling in the same waters, he might trawl his net contrary to the way in which I was drawing mine; it would then be a question which of us should yield, and there must be a destruction on the one part or the other; one of us must suffer.

52,714. One of you would have to give way?—Yes.

52,715. Then you say that the two modes of fishing are so incompatible the one with the other that they ought not to be allowed to go on together?—Yes, so far as these narrow waters are concerned, I do not think they can go on together.

52,716. In the upper part of Loch Fyne you believe it would be quite impracticable?—Yes.

52,717. In the lower part of the loch there is more room?—Yes.

52,718. With regard to the close-time, have the fishermen of this loch any desire to see the month of January made an open season?—That does not affect this part of the loch; but we do not wish to be a hindrance to any other person. Supposing the open-season was allowed to go on until the latter end of January, we consider that it would not do any harm.

52,719. It would not do any harm to the brood of fish?—No.

52,720. Good marketable fish might be taken during the month of January?—Yes, in a middling state. They would not be very good.

52,721. But fish caught then would be readily taken as food?—They would take fish that might be used pretty well, but they would not be in as good order as they would be in the month before.

52,722. When trawling was carried on in the loch here, do you recollect how many trawl-nets there were belonging to Inverary?—Yes.

52,723. How many?—Only two, I believe.

52,724. Why was it that the Inverary men did not take to trawling as much as the other men?—They saw plainly that it was a practice that would not do and that it would not work. If all men were to take to it it would not work.

52,725. Did they think it was not as profitable as the other kind of fishing?—It might do for a few; but if the whole body turned to it it would do away with all the fish in the course of a few months.

52,726. They complained of the trawlers in other parts for taking large quantities of fish which they would otherwise have taken?—It is not that altogether, but the fishing would be shut up. There would be no fishing in the course of a few months, and that is the reason why we considered, as a body of fishermen, that it was needless to begin that mode of fishing.

52,727. With two exceptions, none of the fishermen here provided themselves with nets or boats for that purpose?—No, there were only two who owned nets and tried it. They took a good deal of fish.

52,728. When you went out to fish at these times did you generally find that the trawlers came to work after you had shot your nets?—Yes.

52,729. They were not on the ground before you?—No, they were seldom there before us. It was after the drift-net men were there that they came. That is the way in which they did us so much damage.

52,730. Did you ever set your nets near the shore and see the trawlers ready on shore to set theirs?—Yes.

52,731. What did you do then?—We left the place.

52,732. Did you go outside for two or three hundred yards?—Yes, and more; perhaps for miles.

52,733. Why was that?—Because we were not sure that they would not come just on our nets as they did often and destroy them. We kept plenty of distance away from them.

52,734. Did not the trawlers prefer trawling in-shore, as being of more benefit to them?—They fish in the deep as well.

52,735. Was it not generally the case that they took better hauls of fish in-shore?—Yes.

52,736. And they preferred fishing in-shore?—Yes.

52,737. Would it not have been sufficient for you to shoot your nets 300 yards from the shore, leaving the space in the inside for the trawlers?—We are as keen to be where the fish are as they are, and we would leave as little space as possible.

52,738. But you told me you often went miles away?—Yes, when we saw the trawlers on the ground.

52,739. Would it not have been sufficient to go 300 or 400 yards off the shore and shoot your nets there?—No; perhaps there would not have been any fishing there, and we should have had to go for miles before we saw the appearance of fish. We generally see the fish in the water at night.

52,740. Do you suppose they would be near the shore all the night?—Yes, sometimes they follow along the shore, and we see none but what are on the shore. At other times they go out in the deep, and there are none in-shore at all.

52,741. But there are a good many parts of the loch in which the trawlers cannot trawl in-shore?—Yes.

52,742. You would have an opportunity of setting your nets there?—Yes.

52,743. Do you think it would be a hardship if the drift-net men were not allowed to set their nets within 200 yards of the shore?—To be sure; it would be a disadvantage to them. Sometimes the body of fish is lying close to the shore, and if they were prevented from shooting their nets close to the shore they might as well keep on the shore altogether.

52,744. Do you think that setting drift-nets a quarter of a mile from the shore would prevent the fish from coming in shore?—No, we seldom consider that the drift-nets turn the fish in one direction or another. They take the same course notwithstanding the nets.

52,745. The nets do not frighten the fish?—No.

52,746. Does the luminous appearance in the water drive the fish away sometimes?—No, we do not consider that it does. They may keep some distance from the nets if the burning is strong in the water, but the fish do not take another course.

52,747. Would the fish rise or sink but still go in the same direction?—Yes, and at times they would go neither forward nor backward, but would stop in the same place without moving east or west. They would then just keep quiet.

52,748. They would neither move on nor go to the bottom?—No. We sink our nets in the deep here where we do not expect the fish spawn. The bottom of Loch Fyne is a muddy place, and we do not expect that the fish spawn there.

52,749. Have you ever sunk your nets on ground where you expect the fish are spawning?—No.

52,750. In what depth of water are the banks you fish upon?—Some of them will be 20 fathoms down to the bottom, and others will be as shallow as 10 fathoms.

52,751. Have you taken the fish there in August and September, just as the fish have been spawning?—It is very seldom that they have been taken at the head of the loch, and that is the only place we know of here where the fish spawn.

52,752. Did you take them by sinking the nets down to the ground?—No, it is not so deep there. They get them on the surface without sinking the nets.

52,753. Have you taken spawning fish there this year?—No, not for a number of years.

52,754. How long is it since they were taken there in great numbers?—I cannot say how many years, but I think it will be six or seven years since there were many full herrings taken here.

52,755. Then do you think that the fish you are taking now spawn outside of the loch altogether?—We cannot answer for that. We expect that the great body spawn outside, only there is a certain portion of the fish which we think spawn inside on banks here and along the coast.

52,756. Do you think it would be of any advantage to the fishermen to be allowed to take herrings for bait during the close-time?—I cannot say.

52,757. Is there not sufficient line-fishing here to make it a matter of importance?—No, there is very little fishing going on here. That sort of bait is not much required. Mussels are the only things which are used in general here.

52,758. Do you recollect before the close-time was enforced here whether the fishermen fished during the months that are now close-months?—They did not fish after January. They fished at times in the Kyles of Bute until the latter end of January.

52,759. Did they give it up then?—Yes, they generally gave it up at that time.

52,760. Did they have a good fishing at that time?—Some years they did pretty well.

52,761. In the Kyles of Bute?—Yes.

52,762. Were the fish in good order at that time?—They were not in very good order, but they were in a middling state.

52,763-4. In what condition were they?—They had declined a little. They were not so fat or so full.

52,765. Are the boats here mostly the property of the fishermen?—Yes.

52,766. Do the fish-curers make advances to them?—It is very seldom that they do, so far as I know.

52,767. (*Mr. Caird.*) Are there many dog-fish and other fish that prey upon the herrings in Loch Fyne?—At times there are a good number of fish that prey upon the herrings.

52,768. Are many of the herrings often eaten in the drift-nets?—No; there are a few of them at times, but at other times there are none at all.

52,769. I suppose that the season will vary taking one with another with regard to the prevalence of dog-fish?—Yes.

52,770. Has this been a bad year for dog-fish or otherwise?—I have heard very little complaint with regard to them this year.

52,771. (*Mr. Lefevre.*) Have you had a good season so far this year?—It has been in a middling way. It has not been very good, but I have seen worse years too.

52,772. Were you out last night?—Yes.

52,773. What did you take last night?—Nothing at all.

52,774. Would you call 18 maze a good take in a trawl?—Yes.

52,775. A large take?—Yes.

52,776. For a trawl?—Yes.

52,777. At one haul?—Yes.

52,778. Would it be a good take for any net?—Yes.

52,779. And it would be a good take for a trawl-net?—Yes.

52,780. Would you expect to find the fish come into the boat dead?—Part of them might come dead and the other part alive.

52,781. Is that a fair average take of fish by a trawl net?—18 maze?

INVERARY.

J. Munro.

23 Sept. 1864.

52,782. Yes.—It is a fair fishing but it would not be as heavy a fishing as I have seen. I have seen 200 or 300 maze which were quite sufficient to destroy the net and make the fishermen leave them behind.

52,783. That would be an extraordinary haul in a trawl?—Yes, they have got that. They got 1,100 maze once.

52,784. That would only be taken once in a way?—No, but there have been large hauls taken at times.

52,785. It will not be often that they take as many as a hundred maze?—No, it is very seldom that they take a hundred maze, but I have seen them take as much as 200 or 300 maze.

52,786. Was it the case last night that most of the boats out from Inverary made a poor fishing?—Yes, it was a poor fishing for most of them. There were a few that got a good fishing.

52,787. Were they fishing in the upper part of the loch?—Not near the very head.

52,788. How far off?—A mile or two from this.

52,789. Up the loch?—Yes, some of them; the rest of them were down the loch.

52,790. Was there any difference in the catch of those further up the loch and those further down?—Those further up the loch and those also further down got the best fishing.

52,791. Did the others not take much?—In the middle of the loch nothing was done.

52,792. What would be the best take a boat had last night?—I cannot say, but it was only a light fishing; very likely a couple or three maze.

52,793. To a boat?—Yes.

52,794. The fishing of 1862 was a very fine one?—Yes.

52,795. The fishing of 1863 was not nearly so good?—No.

52,796. And the fishing of 1864, so far, has not been any better I suppose?—No.

52,797. Have you formed any opinion as to the decline of the fishing?—We have different opinions about it, but what the real and right opinion is I cannot state exactly. I do think however that the herrings here have come to be larger and heavier than they were and that they do not swim as much as they did when they were lighter and of a less size as in 1862.

52,798. And therefore they do not mesh as easily?—No.

52,799. That would rather be an argument for another mode of fishing, would it not?—I do not think it matters with regard to that. We think there are plenty of fish in the water but we consider that the weather is not in favour of the fish. In the wet weather the tides are strong and the fish do not mesh so well.

52,800. Then it is not that there is any lack of fish in the loch?—There are more fish in the loch than there have been in Loch Fyne for a number of years.

52,801. But yet you do not catch them?—No.

52,802. Have the fish been in the loch all the season?—Not all the season.

52,803. When did they come in?—Perhaps there was a month in the season before there was anything to signify in the loch.

52,804. The month of August?—Yes.

52,805. They began to come then?—Yes.

52,806. Do you think the fish have gone out of the loch again without being taken?—No, I do not think many of them have gone away yet.

52,807. They are here yet?—Yes, we consider there are plenty of fish in Loch Fyne only we cannot work them well.

52,808. You said that the fish as the season goes on get smaller?—Yes.

52,809. That would indicate that a different class of fish will come in later in the season?—Yes.

52,810. Have they come in yet?—No.

52,811. Are the larger class still in the loch?—Yes.

The witness withdrew.

J. McNichol.

JOHN MCNICHOL called and examined.

52,812. (*Mr. Caird.*) Did you hear the evidence of the previous witness?—No, I did not.

52,813. Have you ever used the trawl in the upper part of Loch Fyne?—I have used it especially in Loch Long and on the south coast, but not at the head of Loch Fyne.

52,814. Have you never used it at the head of the loch?—Only on one occasion.

52,815. Then you cannot say much as to the advantage or disadvantage of it at the head of Loch Fyne?—I can say this much that I have seen the drift-nets hurt a great deal by the trawl-nets.

52,816. In Loch Fyne?—Yes, at the head of Loch Fyne.

52,817. Then it was some other trawl-net and not your own?—It was not my own. I dropped the trawling altogether 10 years ago.

52,818. Did you trawl for herrings?—Yes, and for all kinds of fish.

52,819. With a circle-net?—Yes.

52,820. You do not refer to the beam-trawl?—No, I never trawled with a beam-trawl.

52,821. Why did you give up the circle-net fishing?—The law was against it; it was an illegal mode of fishing, and it was always destructive.

52,822. It is obvious that any man who desired to be a good citizen would not continue to fish when the law was against him. But was there any good reason apart from that that caused you to give it up?—I did not wish to hurt my neighbours.

52,823. Did you find that you were hurting your neighbours?—Yes.

52,824. In what way?—Because I killed fish that were not of a proper size, and I killed fish of every description.

52,825. Are you referring now to herrings?—Yes; I have killed them from three inches long to the largest size.

52,826. When you killed those of three inches what month of the year was it?—It was at the latter end of the year, about October.

52,827. You killed small herrings in October?—Yes.

52,828. Did you find many of them in the month of October?—Yes, great quantities in Loch Long.

52,829. What was the size of the mesh of your net?—It was the common size of the herring-net.

52,830. An inch mesh?—Yes; but the mesh shuts up and closes at the time of drawing it up, and then it will take the smallest herrings.

52,831. Have you ever seen the smallest herrings escape out of the net?—Plenty of them, but they took quantities ashore.

52,832. Besides?—Yes.

52,833. Did you get large hauls of fish?—Tolerably large hauls.

52,834. Have you ever had such large hauls that you could not take them on shore, or make use of them at all?—We got the boat loaded, and left a few.

52,835. Have you left many behind that you could not make use of?—Yes, we did; we left a good many behind us.

52,836. Was that in the sea or on the shore?—We did not take them ashore at all.

52,837. Did that very often happen?—Not very often. There is a great deal of ground in Loch Long where you cannot take the net ashore.

52,838. And then you got so large a haul that your boat would not hold them all?—Yes.

52,839. That happened now and then?—Yes.

52,840. If you thought that was going to happen often you would have another boat?—Yes; but we did not know when it was going to happen.

The witness withdrew.

ALEXANDER MCARTHUR called and examined.

52,841. (*Mr. Caird.*) Have you often been engaged in herring-fishing?—Yes, in Loch Fyne.

52,842. Have you practised any other fishing except herring-fishing?—Yes; I was two seasons at trawling.

52,843. Herring-trawling?—Yes.

52,844. Have you ever fished for cod, whiting, haddock, and so on?—No.

52,845. You are only a herring fisherman and nothing else?—Just so.

52,846. You say you used the trawl for two seasons?—Yes.

52,847. Was it in the upper part of the loch?—I have tried the other too.

52,848. In every part where a trawl can be used?—Yes; on both sides from Skipness Point.

52,849. Was that at the time trawling was permitted to be done?—Yes, nine years ago.

52,850. Have you not trawled since?—No.

52,851. What was the size of the mesh of the net of the trawl?—It was a common drift-net and we made it into a trawl-net.

52,852. Was it the same depth?—No, it was a good deal deeper.

52,853. How deep was it?—It was 15 fathoms deep.

52,854. What length was it?—It was 200 yards long.

52,855. When you were fishing with the trawl-net were you occasionally fishing with the drift-net, or did you confine yourself to the trawl alone?—No; at one of the seasons I was engaged with the trawl-net entirely, and on the last occasion I worked with both.

52,856. Were you very successful when you were entirely engaged in trawling?—Yes; I made a good year's fishing out of it.

52,857. Did you make a better fishing on the average with the trawl-net than you did on the average in the season with the drift-net?—We were making more money, but when it was divided each man would have done better at the drift-nets.

52,858. How did that happen?—Because more men were employed.

52,859. There were more to divide it among?—Yes.

52,860. On the whole you were not paid better one way than another?—The drift-nets paid the best.

52,861. You found that to be so?—Yes.

52,862. Did you find that you could fish your trawl-nets without interfering with the drift-net fishermen?—Occasionally; sometimes there were no drift-nets near us, and at other times there were.

52,863. Were you able to make your circles and take in your nets, generally speaking, choosing your own ground, without coming into contact with the drift-net fishermen?—I never came into contact with them.

52,864. You found it practicable to keep clear of them?—Yes, but there were no drift-net men working near me.

52,865. Did you make large hauls with your trawl-net?—Yes.

52,866. Have you ever made such large hauls that you could not make use of your fish?—Yes.

52,867. Was that a common occurrence?—Only on one occasion.

52,868. During all your experience?—Yes.

52,869. In that one case what prevented you from making it?—I filled all the boats I had and I left the rest.

52,870. How many boats had you?—Four.

52,871. If you had had more boats could you have filled them?—Yes, I could have filled 20 of them.

52,872. Were the fish in good order?—Yes, they were very large herrings.

52,873. Did they sell readily?—I cured them myself.

52,874. How did they succeed in the cure?—Not as well as the drift-net herrings; they were black at the bone.

52,875. Did you sell them as cured herrings?—Yes, but I did not get a good price.

52,876. Was there much difference in the price?—10*s.* a barrel.

52,877. (*Mr. Lefevre.*) What did you get per barrel?—2*l.*

52,878. (*Mr. Caird.*) That is a good price?—Yes.

52,879. Then it was only on one occasion that you had such a large haul that you could not make use of them?—Yes.

52,880. Were many of the fish dead on that occasion?—They were all of them dead.

52,881. Did they sink to the bottom?—Yes, when I let them go.

52,882. (*Mr. Lefevre.*) Were you drawing up to the shore on that occasion?—We did not tow them inshore at all.

52,883. What depth of water were you in?—Five fathoms.

52,884. How many did you succeed in taking ashore?—Four boatloads; we succeeded in taking off 100 barrels.

52,885. (*Mr. Caird.*) Have you found when you have been fishing with the trawl that you destroyed many small fish unfit for the market?—Yes.

52,886. Large quantities?—Yes, I have caught herrings that would run about 3000 to the barrel.

52,887. They were as small as that?—Yes.

52,888. At what time of the year was it?—I got them in August, September, and October.

52,889. In what part of the loch?—Down below Ardrishaig.

52,890. Was that a common occurrence?—Yes, for a whole month I have been working for them.

52,891. What did you do with them?—I took them to Ardrishaig.

52,892. Did you sell them?—I sold them for a small price.

52,893. Were you getting other herrings with them?—Yes, I was getting good herrings with them.

52,894. You did not throw them back into the sea as useless?—No.

52,895. You always sold them?—Yes.

52,896. For food?—Yes; they would not be good, but I always sold them.

52,897. They were not thrown into the sea as useless?—No.

52,898. What proportion of the catch would be of that small size?—If I got seven or eight maze at a time one half of them would be small and the other half would be pretty good herrings; we sold them mixed together.

52,899. (*Mr. Lefevre.*) Do you take large and small in the same haul?—To be sure, we took everything that came before us.

52,900. (*Mr. Caird.*) Did you get any other kind of fish besides herrings in your trawl?—Yes, all sorts.

52,901. Did you ever notice that with the trawl-net you broke the shoal of the fish?—I think we should break it that night when we got the heavy haul.

52,902. You took the most of it I suppose?—No, there were plenty who got more than us; there were 12 or 14 trawlers where we were, and most of them left fish lying; they filled their boats and left the rest lying.

52,903. That was on some extraordinary occasion?—Yes, down at Ardlamont Point.

52,904. Have you ever observed that you did interrupt and break the shoals of the herrings with your circle-nets?—I think it would be the case.

52,905. Have you been most successful near the shore or out in the deep?—Near the shore.

52,906. That is the best place for trawling?—Yes.

52,907. If you were fishing near the shore would not the great body be further out at sea?—Sometimes there came plenty near the shore; I have seen them within two or three fathoms of water.

52,908. Did you ever knowingly pass over the

INVERARY.

A. McArthur.

23 Sept. 1864.

spawning beds and tear up the spawn with your nets?—I never observed that.

52,909. You say you never came into contact with the drift-nets, or did them any harm?—No.

52,910. If you were allowed by law to fish with the trawl-net or drift-net just as you thought most advantageous, and when you thought the herrings were not meshing well in the drift-nets, you might take to trawling; if the law permitted you to do that, would you try the trawl and use it with great success?—I don't think so at the present time.

52,911. Why; can you give us a good reason for that?—I do not know, I think when the money is divided and all the expenses come to be paid the drift-net fishing is the best mode of fishing.

52,912. That is taking the average of all the year round?—Yes.

52,913. But if you had the privilege of fishing, either with the trawl-net or the drift-net, as circumstances rendered desirable, would you not do it?—I think trawling is very injurious to herring-fishing, that is why I dropped it.

52,914. What is the special injury that you think you did to the herring-fishing with the trawl?—By taking in the young herrings and killing them.

52,915. Was that the chief injury you think you did?—That was the most harm that ever I saw.

52,916. (*Mr. Lefevre.*) Before the close-season was enforced did you ever use your trawl in January, February, March, April, or May?—No.

52,917. Do you know if the trawl-nets were much used in the loch during those months?—Yes, they were used in January, February, and March.

52,918. You have seen them?—Yes, and they have taken small herrings.

52,919. Would they take a larger proportion of young herrings at that time than at other times of the year?—Yes, they would take a good number. I have seen them in the Kyles of Bute take herrings that would go 1,400 to a box.

52,920. What size would the herrings be?—About three or four inches.

52,921. Did you take fish as small as that during August, September, and October?—Yes.

52,922. Was there any part of the loch where you found more than another?—Yes, down below Ardrishaig. Below Ardrishaig and Tarbert.

52,923. Did you take them in upper Loch Fyne?—No, we were chiefly working down there.

52,924. What number of hauls could you make in the course of a night with a trawl?—Perhaps we might get plenty in the first haul, or perhaps we might trawl all night and not get one. We never tried unless we saw the herrings in the water.

52,925. You might be some time looking for them?—Yes, and never come across them.

52,926. Could you make as many as 10 or 12 hauls in the course of a night?—No, we could not do that.

52,927. How many?—Five or six perhaps.

52,928. What would be a fair average take of herrings in a trawl?—It is a good take when a person gets the full of his boat.

52,929. How much is that?—Thirty or 40 maze.

52,930. You would not expect to do that every night, would you?—No.

52,931. What kind of earnings would you make when you were trawling?—We were averaging sometimes 6*l.*, 7*l.*, or 10*l.* a month.

52,932. And since you have taken to the drift-net fishing what have you made?—Sometimes more than that and sometimes less.

52,933. On the average have you made more?—Yes, I am better off at the end of the year by using drift-nets.

52,934. Had you a share in a trawl-net yourself?—Yes, it was a share I had.

52,935. Did you sell it?—No, I brought it down into a drift-net again.

52,936. Do you think the same fishermen could carry on the two modes of fishing together; could they trawl and upon the same night use the drift-nets?—No, they could not work both.

52,937. Were there some nights when you could not use the trawl-net at all?—No, I do not think so; but it takes eight men to work a trawl-net. Two or three men will work a drift-net.

52,938. Was it not often the case that the weather was such that you could not work the trawl; for instance, on a bright moonlight night?—It would not be as successful.

52,939. Did you go out every night?—Yes.

52,940. Even on moonlight nights?—Yes.

52,941. Did you not work with the drift-nets at all when you were trawling?—In one season.

52,942. Did you in the other?—Yes, one season I worked at both. Two boats of us joined together.

52,943. Have you often known it to be the case that the trawlers would get a good haul of fish when the drift men would not?—Yes, often.

52,944. Has that occurred for any length of time—for several weeks together?—Yes, I have seen it for several weeks.

52,945. And then the drift fishermen had a turn of luck themselves?—They were always getting a little.

52,945*a*. Did you ever know it to be the case that the drift fishermen got large hauls of fish and the trawlers did not?—Yes, often.

52,946. Was that when the drift-nets were sunk deep in the water?—Yes, and sometimes when they were light on the water.

52,947. How do you account for that?—I cannot tell. I think it is eight or nine years since there was an eye of fish that came early in the season. We got a good fishing in the drift-nets and when we tried the trawl-nets we could not get the fish.

52,948. And yet were they close to the shore?—Yes, they were quite close to the shore; I could not understand it.

52,949. You have not fished with lines yourself?—No, I never was at the lines.

52,950. (*Mr. Caird.*) Have you any opinion with regard to the extension of the close-time; would you make January an open month?—I have no objection to another month.

52,951–60. Do you think it would be any advantage to the fishermen and the supply of fish to the market if January were made an open month?—It might be an advantage to some but the most of them would not follow it.

52,961–2. In the upper part of the loch?—No, we would never follow it after December.

52,963. But in the lower part of the loch might it suit them better?—Yes, they might follow it.

52,964. Have you found the fish in a fair condition in the month of January?—They are not so good then.

52,965. But still they are caught marketable?—Yes.

52,966. And wholesome?—Yes.

52,967. (*Mr. Lefevre.*) When all the boats were fishing in the upper loch you would hardly find room to shoot your trawl-net at all?—We could not without injuring the drift-nets.

52,968. Were the trawlers in the habit of shooting their nets there notwithstanding that?—There would not be room for us both to work properly.

52,969. But supposing the trawl fishermen came up to this part of the loch and found all the drift-nets about would they go lower down or try to shoot their nets between them?—Sometimes they would get room and at other times not, it would depend on the number of boats there.

52,970. Was it a disadvantage for the trawlers to shoot their nets so as to get them among the drift-nets?—Yes.

52,971. They looked if they could for a clear space?—Yes.

52,972. Could you generally see where the drift-nets were?—Yes.

52,973. Even on a dark night?—Yes.

52,974. You do not cover a large space with your trawl so that you could see where the herrings were?—We might get a large enough space where there were no herrings.

52,975. You looked for two things, first for a clear space and then for the fish?—Yes.

52,976. (*Mr. Caird.*) Have you any opinion at all as to the advantage of a close-time?—Yes, I think there is an advantage.

52,977. What is it?—There is an advantage in it especially in the month of February. I know that the herrings are spawning in that month and in the beginning of March.

52,978. You think it of advantage not to fish them at that time?—Yes.

52,979. (*Mr. Lefevre.*) Where are they spawning?—In the Kyles of Bute and in Loch Ridun. Loch Ridun is full of herrings all the winter. In January, February, and March they were there full of spawn and I think they spawned there.

52,980. Do they leave as spent fish in the middle of March?—Yes, and I know they were full of spawn at the time they were there.

52,981. Do you think they come up to the top of Loch Fyne to spawn here also?—I don't know whether any herrings are here at that time or not.

52,982. (*Mr. Caird.*) Have you ever observed, as you have been a fisherman in different parts of the coast, whether the fact of steamers passing up and down and agitating the water has had any effect on the herring fishery in that particular locality at that time?—I do not think that any steamers that come up here have any effect on the fishing.

52,983. Do you think that the navigation of the loch by steamers during the time the herrings are in it has no effect on the fish in one way or another?—I do not think so.

52,984. Not the slightest effect?—No, not the slightest.

The witness withdrew.

DONALD MCCALLUM called and examined.

52,985. *Mr. Caird.*) Are you a herring curer?—Yes.

52,986. At Inverary?—No, at Loch Gare, further down.

52,987. Where is that?—On the other side of Ardrishaig.

52,988. In Loch Fyne?—Yes.

52,989. Have you for several years been engaged as a herring curer?—Yes.

52,990. Have you cured the different kinds of fish caught in Loch Fyne both with drift-nets and trawl-nets?—Yes.

52,991. Have you found much difference in the character of the herrings?—Yes, there is a great deal of difference.

52,992. In herrings caught the same night?—Yes, and cured the same day.

52,993. What is the difference you have observed?—I have seen the trawled herrings picked out, namely, those which had the best scales, in order to cheat the Glasgow curers.

52,994. But you, as a curer on the spot, would detect the difference?—Yes. On the occasion I am referring to the two different kinds were put into a barrel with different marks, and although the marks were unknown to the buyers, they objected to the herrings because they saw a difference.

52,995. Who did?—The people in Glasgow.

52,996. The herrings went to the market?—Yes, as net-herrings, but there were trawled herrings with them.

52,997. The curers were able to distinguish the difference?—The cooper was.

52,998. Was that after they were cured?—Yes, about a month or a fortnight afterwards.

52,999. What have you observed with regard to them; in what way are they inferior?—I have seen the difference.

53,000. In what way?—They are smothered. There is a white thing between the skin and the scale of the herring. When they are in the brine that will float like something in a river. You will see the brine quite spotted with it; but that is not the case with the net caught herrings.

53,001. Does that interfere with the quality of the herrings?—Yes, they will not keep as long as the drift-net herrings.

53,002. Have you as a curer ever bought trawled herrings, knowing them to be trawled herrings, for the purpose of curing?—I have sent them to the market for smoking.

53,003. Does that answer well?—No.

53,004. What are they used for?—I do not think they are of use for anything but manure when they have long been cured.

53,005. Are they not taken readily at Glasgow and Greenock markets?—Yes.

53,006. During the time they were permitted to be trawled were they not sent regularly to the market?—Yes.

53,007. They were sent to the market?—Yes, they might be used for a short time, but not when they have been long kept.

53,008. Is any fish good when it has been long kept?—No.

53,009. You say that trawled herrings do not make good herrings to cure?—Yes.

53,010. Are they good enough to eat fresh?—They are good, but not as good as the net herrings.

53,011. Are they an inferior quality of fish even as fresh fish?—Yes, those you take by the trawls are inferior to those that are taken by the net.

53,012. What is the reason of that?—It is because they are smothered. Trawled herrings are like beef that has been smothered, or a bad sheep when it is bracksied.

53,013. Bracksied sheep are not smothered?—They are like those which are smothered, because they get their death very quick, and so do the herrings that are caught by the trawl.

53,014. (*Mr. Lefevre.*) I thought you said the trawl-nets took a different class of fish?—Yes, they do take a different class of fish, and they take all sorts of fish too.

53,015. What is the reason of that; are the fish of a different age?—Yes, and of different kinds.

53,016. Would not the drift-nets catch those fish at all?—The nets catch some of them but not altogether. There are fishes for every sort of net, but the trawl-net takes everything that comes in its way.

53,017. Are those fish a larger or a smaller class of fish?—Smaller and larger.

53,018. Do you think the trawlers catch a certain number of large fish and also of small fish which the drift-nets would not catch?—They catch larger herrings sometimes.

53,019. How long were you a curer?—Up to within the last five years I have been engaged curing herrings ever since I can recollect. I have been round the coast since and have seen the curing going on.

53,020. When you could not get fish from the drift-net fishermen did you buy them from the trawlers?—Yes, I bought them from any person I could get them from, but I always kept the trawled herrings separate from the drift-net herrings.

53,021. You kept them separate?—Yes.

53,022. Did you sell them as trawled herrings?—Yes, I had to do that.

53,023. What was the difference in the price?—From 5*s.* to 8*s.* and 10*s.*

53,024. Five shillings a barrel?—Yes; but it would depend upon how the market was going. If the herrings were going at 30*s.*, I got within 5*s.* of the price; and

INVERARY.

D. McCallum.

23 Sept. 1864.

if it was 2*l.*, I got within 8*s.* or 10*s.* It depended on the price in the market altogether.

53,025. Do you think the people can tell upon looking at a barrel of herrings whether they were drift-net herrings or trawled herrings?—Yes, anyone that was well acquainted with them would do so.

53,026. (*Mr. Caird.*) Is there anything further you would like to tell us?—Nothing further.

The witness withdrew.

A. M'Nichol.

ARCHIBALD M'NICHOL called and examined.

53,027. (*Mr. Caird.*) Are you a fish-curer here?—I am not a fish-curer now, but I was curing for Mr. Munro eight years back down at Sand Hill.

53,028. Where is that?—The other side of Furness, about eight miles below this.

53,029. In the loch?—Yes.

53,030. Then you are acquainted with the quality of the different kinds of fish caught in Loch Fyne?—Yes.

53,031. Have you cured both trawl-caught and drift-caught herrings?—Yes.

53,032. Caught on the same day?—Yes.

53,033. Have you observed any great difference between the character of the two kinds of fish?—Yes.

53,034. In the quality?—Yes.

53,035. What is the difference?—It would not cure as well.

53,036. The trawled fish would not cure as well?—No.

53,037. In what respect did it not cure as well, or how did you discover that to be the case?—I cannot tell you, but they are very black at the bone after being salted.

53,038. Did the buyers readily take them after they were cured?—Yes.

53,039. Was there any difficulty in selling them?—Sometimes there was if there were plenty of net-herrings.

53,040. In that case the trawled herrings were not so readily sold?—No.

53,041. If there was a scarcity of drift-net herrings they would sell better?—Yes; anything will do so when there is a scarcity.

53,042. What difference have you noticed between the price of the drift-cured herrings and the trawl-cured herrings?—From 5*s.* to 10*s.*, and sometimes more or less.

53,043. Is it generally admitted that trawled herrings are better adapted for immediate consumption than for being cured?—They use more of them, any way.

53,044. For the fresh market?—Yes.

53,045. Does the blackness at the bone to which reference has been made show itself in fresh fish as well as when salted?—Yes.

53,046. Would you discover the blackness upon fish that were quite fresh caught?—Yes, it is always seen in a herring that has been caught by the trawl-net.

53,047. Is there a distinct difference between the two?—Yes, there is.

53,048. Where does it show itself?—In the blackness of the fish.

53,049. In the back bone?—Yes, and in the want of scales also.

53,050. Is it in the flesh of the fish?—Yes.

53,051. In what way does the flesh of the fish differ?—That is more than I can tell.

53,052. How does it appear; how do you see it?—When you open the herring or gut it you see it inside.

53,053. What do you see?—The flesh of the trawled herring is black, while that of the drift herring is quite white.

53,054. You have constantly witnessed that as a curer?—Yes.

53,055. And you could distinguish between them readily when they were presented to you?—Yes.

53,056. (*Mr. Lefevre*). Do they fetch the same price in the fresh market?—I do not know. I do not think they do, but I was never there with them.

53,057. You cannot say?—No, I believe they do not fetch as high a price, but I am not used to them.

53,058. You prefer drift-net herrings?—Yes, but I have been told there is a difference in the price.

53,059. When you have been eating them fresh have you noticed any difference in the taste between the two?—Yes.

53,060. What is the difference in the taste?—It is not at all as fresh compared with the taste of the net-fish.

53,061. When both have been brought in the same morning have you observed any difference?—Yes.

The witness withdrew, and the inquiry was adjourned until the 24th of September, at Tarbert.

Tarbert, Argyleshire, Saturday, 24th September 1864.

PRESENT:

J. CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

TARBERT.

N. Bannatyne.

24 Sept. 1864.

NINIAN BANNATYNE called and examined.

53,062. (*Mr. Caird.*) You are a fish-curer in Glasgow?—I am a fish-curer in Glasgow, and in Tarbert. I have been engaged in curing at Tarbert for 32 years. I have also cured in the Orkneys, at Pittenweem, Anstruther, and in every part of the islands.

53,063. At present you are extensively engaged in the business of a curer?—I was extensively engaged as a curer, but by the prohibitory restrictions which have been established I cannot get any herrings to cure in Loch Fyne. And instead of having at this season my four or five vessels lying in Tarbert Harbour, and 50 or 60 in Loch Fyne, I have the pleasure of looking at none at all. I believe it would not pay me to have a vessel here at the rate of 10*l.*, 15*l.*, or 30*l.* a month lying idle, and therefore there are none here because I could do nothing with them.

53,064. You have for some years been acquainted with the herring-fishing as followed in Loch Fyne and followed on the west coast of Scotland?—Perhaps I am the oldest fish-curer alive in Loch Fyne, Greenock, or Glasgow. I am contemporary with Mr. John McClean. In 1826 I was with John McClean: that is 38 years ago, when I was 14 years of age, and we were then curing, cutting, and packing in Scalpa, in Portree, in Loch Carron, and in other places.

53,065. We will take it that you are an extensive curer, and that you are well acquainted with the quality of the fish caught in Loch Fyne?—Yes, and on the other coast likewise—in the Orkneys, in Shetland, and anywhere you like to go in Scotland.

53,066. Have you been in the habit of making many purchases of herrings in Loch Fyne for the purpose of curing?—Yes.

53,067. Have you also been a buyer for the fresh market?—Yes.

53,068. Can you tell us whether there is anything in the quality of the different catch of herrings by the drift-net or by the trawl-net which particularly fits the one for the one kind of market more than for the other ?—Yes.

53,069. What is that quality ?—The first trawled herrings that we caught in Loch Fyne were caught in the year 1833, in December. Those herrings were then on the coast, and still are, and they lie dormant in 60 or 70 fathoms of water. Trawling previous to that time never had any existence.

53,070. That is not exactly an answer to the question I put to you ?—The take by two men was very heavy. I think they caught 6,700 barrels putting their nets across the mouth of the other bay ; and I purchased to the extent of 400*l.* or 500*l.* worth from them. The others went to the farmers and the other fish curers in the neighbourhood.

53,071. Was that the first occasion on which a trawl-net was used in Loch Fyne ?—Yes.

53,072. That was in the year 1833 ?—Yes. The quality of those herrings was very good. They were from 600 to 700 to the barrel, and they were superior to any herrings taken by the drift-nets in that season. They were sold in Glasgow by me at 5*s.* a barrel above the price of the regular drift-net herrings which any other curer had in Glasgow.

53,073. Has that continued to be your experience of the quality respectively of the drift-net and the trawl-net herrings ?—I have been living in Tarbert for several successive years during the fishing, and I have paid for trawled herrings in June and July 25*s.* when on the same morning and at the same time I have bought the drift-net herrings at 12*s.* 6*d.*

53,074. What was the difference ?—The difference was this : that from 400 to 500 of the trawled herrings would fill a barrel, whereas it would take 800 or 1,000 of the drift-net herrings. Therefore, notwithstanding that I paid 25*s.* for the trawled herrings, they were of a superior quality, and they were as cheap as the others at 12*s.* 6*d.*

53,075. Is there anything in the mode of catching that particularly fits the one description of herring for the fresh market more than the other ?—If the trawled herrings are taken out of the same loch, and the same place as the drift-net herrings, they are identically the same. The quality is equally good.

53,076. You say that in certain cases which you have mentioned the size of the trawled herrings was larger than the size of the drift-net herrings ; was that the case during the whole season ?—No, but the drift-nets could not take the herrings I refer to, and which I bought at 25*s.* They have no drift-nets in Tarbert that would catch them. The mesh of the net would not admit of their taking herrings running from 400 to 500 to the barrel.

53,077. Is it the fact that no large herrings of that class are ever caught by the drift-nets ?—Yes.

53,078. Do you never buy herrings of that size from the drift-net fishermen ?—I never got herrings as large as 500 to the barrel from the drift-net fishermen.

53,079. Did you often cure herrings of that size bought from the trawl fishermen ?—Yes.

53,080. Was there any large proportion of the cure of that quality ?—That would depend altogether on the quantity caught ; that is to say, if the trawlers came in in the morning with more than was sufficient to supply the fresh herring market, as they have frequently done, then they must be cured.

53,081. Then the fresh herring market takes the first supply ?—Yes.

53,082. Does it pay the best price for the herrings ?—Yes ; because the herrings go to market fresh at a much cheaper rate. We cannot send a barrel of herrings from Tarbert to Glasgow under 10*s.* a barrel expense, whereas a box of herrings goes for 1*s.* 6*d.* freight.

53,083. Do a box and a barrel hold the same quantity ?—About the same quantity. A large box of 12 inches will fill a barrel of herrings packed.

53,084. Then taking the regular course of business here, when the herrings are brought in here in the morning the first demand is for fresh herrings to be sent off to the fresh market ?—Yes.

53,085. Is it only those which remain over that are taken for curing purposes ?—We cannot afford to give the same price for curing, because we are put to 10*s.* of expense. Salt herrings are now getting so abundant in the country that people will not take salt food at all.

53,086. Then are we to understand that when the herrings are not extremely plentiful the larger portion goes to the fresh market ?—Yes, altogether.

53,087. There is no curing at all then ?—No.

53,088. Then it is only when the supply exceeds the demand for the fresh market that you cure the herrings ?—Yes, it is only when the supply is very large. For instance, if 60 or 70 maze of fish come in, perhaps 20 or 30 maze will go by the steamboats to the fresh market, then the curers will say, "We will "not give you 12*s.* for the rest, but we will only "give you 3*s.* 6*d.* for those which we want to cure."

53,089. Is it a great matter to the fishermen to have their herrings in in time for that morning boat ?—Yes, certainly.

53,090. Is there any difference in that respect in their being enabled to be in time for the morning boat as between the drift-net fishermen and the trawl fishermen ?—Yes. The trawl fishermen are always ready. They sometimes come in at 12 o'clock. They have not to shake their nets, and they could put in 200 barrels before the drift-net men could shake out 20 boxes.

53,091. From that fact do they find it more convenient to supply the fresh market ?—Certainly.

53,092. Now, as a curer, and having cured both drift-net fish and trawl-net fish, can you tell us whether you have found any difference in the quality of the two when they are cured ?—I should not know the difference between a drift-net fish and a trawl-net fish if they were taken in what we call the first lift, and then brought to the shore. Those that are first taken from the boat have the scales on them much better than those that are below. I should not be able to tell those trawled herrings from the drift-net herrings.

53,093. Is there a difference in those which may be taken at a different time ; you say those which are taken first ?—Yes, if they come in to the shore, and are taken by the trawl, those on the top are generally the largest fish, and are in the best condition with regard to scales. The boat is filled with the first that are taken.

53,094. You are referring now to the trawl-boat ?—Yes. That boat is sent in, and for the fish in that first boat I would give a shilling per cwt. more than for those which are brought in afterwards.

53,095. At the bottom of the same boat ?—At the bottom of the same take, because they get more tossed and handled about, and the scales come off them more.

53,096. How does that correspond with a boat full of drift-net fish ?—It corresponds exactly. About 50 or 60 maze of drift-net fish may be brought in by perhaps 16 or 18 barrels of nets, sometimes 24 barrels. Those herrings have all they can do to get to the market if there is not much wind. They would not have them shaken out of their nets, therefore, and if it was a warm day the heat of the sun and the pressure of a ton weight of herrings upon those at the bottom would make them as soft as mud, and one half of them would not be worth within 2*s.* or 3*s.* per cwt., the same price as the fish caught in the trawl.

53,097. Without going into the causes that may produce that difference, will you tell us practically whether you find that the trawled fish and the drift-net fish you buy for the purpose of cure you can make into a good cure, so that the one will bring as good a price in the market as the other ?—Yes, I can.

53,098. Practically, do you find that herrings caught by the trawl-net when they are cured sell as well as those caught by the drift-net ?—Yes.

TARBERT.

N. Bannatyne.

24 Sept. 1864.

53,099. Cannot skilled men, curers or fish buyers, discern the difference between the one and the other?—They can discern between well cured drift herrings and those badly cured. There is a difference of 5*s.* a barrel in those which are not shaken out of the nets until 2 or 3 o'clock in the afternoon compared with those which will be made up by 12 o'clock in the day.

53,100. Of course there is a difference between good and bad cured drift-net fish, and good and bad cured trawled fish also?—Yes.

53,101. But if there are fish caught on the same night, and one lot be drift-net fish and another lot trawled fish, and both are put into your hands with the same skill and attention to cure, would you observe any difference arising from the mode in which the herrings are captured?—No, I could not observe any difference. I don't think there would be any difference in the quality.

53,102. Are we to take it from you that neither in the fish supplied to the fresh market, nor in the fish supplied to the cured market, there is anything in the mode of capture which can affect the quality of the herrings?—No, they are got from the same places, and are the same description of herring, only that the drift-nets are not able to take herrings of such large size as the trawl-nets.

53,103. Then, as a curer, you hold them to be of better quality?—They are of better quality.

53,104. Is it a fact that a barrel of herrings equally well cured is valued according to the smallness of the number which fills the barrel?—No, small herrings may be much superior to large ones, but I speak of the herrings caught here in the month of June and July. Those were the principal months in which large trawled herrings were caught.

53,105. Were they only got in the months of June and July?—Yes, they proceed up the loch, I suspect; but they make their exit from the loch soon after, and go down to Ballintrae, where they spawn. Then, when they are coming out of the loch, the fishermen know the time, and go in company with their boats and take a large supply of provisions with them to last for a fortnight. They live in their smacks, and wait with patient expectation until the herrings come down, and then they are amply paid for all their labour and their patience. The herrings they take then are the large herrings I mentioned.

53,106. Then you say the quality of the herrings is not affected by the number in the barrel?—No, it is not.

53,107. It is the condition of the fish itself?—Yes, and the quality. The large herrings in Orkney and on the east coast are not equal to the herrings caught in the Kyles of Bute in January—1,200 to the barrel. One barrel will be worth perhaps 50*s.*, and perhaps the others will never exceed 30*s.*

53,108. How many will there be in a barrel of east country herrings?—They run from 600 and 700 to 800.

53,109. As tested by the price in the public market is there not among buyers and sellers of cured herring a general rule that they are not to give as much for trawled herrings as for drift-net herrings?—I am not aware of it.

53,110. Have you yourself ever met with such a distinction as that?—My eye is my merchant. I look at the herrings.

53,111. You do not care whether they are trawled or not?—No. I look at them. I look at the trawled herrings and the drift-net herrings, and if there are drift herrings that are not properly cured I will not buy them, except at a very low price. Then there are trawled herrings which have not been made up at the proper time. Perhaps they may have been delayed in coming in.

53,112. I am to understand it is not the question of their being trawled or drift-net herring that in any way regulates the price you offer for them?—Not at all.

53,113. I understand quite clearly from you, as an extensive curer, that that is not the case as far as your own experience goes?—Yes.

53,114. Have you ever bought any herrings in the month of January?—Thousands and thousands of barrels in the Kyles of Bute and the Firth of Forth.

53,115. Have you cured those herrings in the west country?—I have cured in one week in the Kyles of Bute 1,000 barrels of fine herring not exceeding 1,100 to a barrel.

53,116. In one week?—Yes.

53,117. In the month of January?—Yes. Those herrings would be caught here in the month of January, and 50*l.* would be paid to poor widows and orphans who get 6*d.* for gutting them and 6*d.* for packing them. I have done that hundreds of times.

53,118. From your own experience as a curer do you consider that herrings in good condition for the market, and wholesome as an article of food, may be taken in the month of January?—They have been taken in the month of January during my time for 38 years.

53,119. Has it been in your opinion a loss in the supply of fish to the public to shut up the month of January?—It is just depriving poor fishermen in this neighbourhood of their livelihood.

53,120. Has it been a loss in the supply to the public market?—Yes, most assuredly.

53,121. To some considerable extent?—Yes, to a great extent.

53,122. Would you go beyond the month of January as to herrings; are they useful as food when caught in February and March?—I should say that it would be as well that there should be a close-time from the 1st of February until the 1st of June.

53,123. That is to say that as a curer you consider the herrings caught in the month of January are of good quality for the market, but not in the other close-months now observed?—From the 1st of February to the 1st of June I would make a close-time. I have been curing in the Firth of Forth, and also in the Kyles of Bute, in January, and the herrings caught in the Kyles of Bute have brought 10*s.* more a barrel than those taken in the Firth of Forth.

53,124. (*Mr. Lefevre.*) Have you not cured any fish this year?—Not this season. In 1862, and for many years previous, I have cured thousands of barrels, but there have not been 10 or 15 barrels cured in Tarbert this year.

53,125. Has the fresh market taken the whole of the supply?—I do not suppose that the fresh market has got one-tenth of the supply that it could have taken, nor has Glasgow been properly supplied.

53,126. But all the herrings that have been taken have been taken to the fresh market?—Yes.

53,127. Did the trawl-boats as a rule come in before the drift-boats?—I have seen them in at 12 o'clock at night.

53,128. Would they come in before the drift-boats?—They were always in before the drift-boats in my experience, except there might be an exceptional case, one out of a thousand.

53,129. I suppose that they supplied the fresh market because they came in sooner than the drift-net boats; was that so?—They are always first at the quay for the purchasers, and the people would all buy their herrings, and so would anyone else.

53,130. Suppose a large boatload of trawled herrings came in would a purchaser for the fresh market take the best quality from the top of the herrings and leave the remainder for the curers?—No, the fishermen, the trawlers, would sell their herrings in no such way. If purchasers buy the herrings at all they buy the whole boatload.

53,131. They must empty the boat?—Yes. The fishermen would not allow any one to pick.

53,132. Is there a price beyond which the curers cannot go; is there a limited price beyond which it would not pay the curers to buy at all?—The present price is between 3*s.* 6*d.* and 5*s.*, according to what comes in. They may be 5*s.* to-day and to-morrow, if they are in abundance, they may be down to 3*s.*, and

if they are very scarce the price may get up to 7*s*. The herrings that were caught yesterday by the drift-net fishermen would run 1,200 to the barrel, and they would cost 60*s*. a barrel.

53,133. Is there a limited price beyond which it does not pay the curers to buy ?—There is.

53,134. What is that limit as a rule ?—The limit is according to the demand. The supply brings the market up and down like any other commodity. When there is a large supply of herrings brought in by the trawl-nets, I have bought trawled herrings at 6*d*. per 100, and drift-net herrings at 8*d*. per 100.

53,135. What is the limit ?—The limit is the supply. We cannot sell the herrings in June and July in Glasgow at more than 50*s*. a barrel.

53,135*a*. What would you pay for the herrings in the boats to enable you to sell them at that price ?—We should require to have herrings of not less than 800 to the barrel at 3*s*. 6*d*. or 4*s*. per 100. That would only be 32*s*. for the fish, but then there would be 10*s*. for each barrel, which it would cost us before we could send them into Glasgow. For curing them and sending them out to the shop there would be something additional, and we should require at least 50*s*. a barrel.

53,136. You could not therefore give more than 3*s*. 6*d*. for herrings for curing because you could not sell them at a price to pay ?—There cannot be a general rate because the demand makes the price. The price of herrings varies according to the quantity. I have known herrings selling one day in Glasgow market for 40*s*., and I have bought them on the evening of the same day at 18*s*.

53,137. Is it possible to tell by examination of the herrings the difference between trawled herrings and drift-net herrings ?—I don't think it is possible to distinguish between them.

53,138. Have you examined the inside of the herrings to see if you could tell the difference ?—There is not the slightest difference between trawled and drift-net herrings in the inside, or in the head, or in the tail.

53,139. Have you examined them yourself ?—Yes, there is no difference.

53,140. Have you cut them open and examined them ?—I have eaten them both at the same time.

53,141. Have you examined and cut them open and looked at them ?—We judge that when we eat them.

53,142. But you have not done that with the view of making any observation ?—I have gutted them both.

53,143. Have you cut them open when they were fresh and before they were cured ?—I have seen them cut open before my eyes.

53,144. Do you think there is any difference ?—No, they are identically the same.

53,145. You have not observed the presence of blood at the back bone ?—That cannot be for they are gutted immediately after they are caught.

53,146. How soon after they are caught are they generally gutted ?—They cannot be gutted too soon. I have heard it said that the herrings bleed from the neck in the drift-nets, but that is not so.

53,147. You do not agree with the statement that the meshing of the herring causes it to bleed and causes a difference in its appearance ?—I say that the meshing of the herring prevents it from bleeding for it is held as stiff as if it were held in a gibbet.

53,148. Is there any difference in the mode of death that would cause any difference in the appearance of the herring ?—No.

53,149. Have you bought herrings at Inverary as well as here ?—Yes.

53,150. Do you find as a rule that the fish there are as good in quality as they are here ?—The fish at Inverary are generally of a larger size than those caught here. The great body of herrings coming down this loch make their way up to the upper loch. There they lie as they are lying at present dormant in 60 or 70 fathoms of water. They do not move, and when a body of herrings take a scud up there you must make them rise and swim before you can get a few herrings.

53,151. The larger class of herrings you have spoken of are taken by the trawlers only in the early part of the year ?—Yes.

53,152. In what condition are they then ?—In very fine condition.

53,153. Are they full fish ?—They have no roe or milt in them, or it is so very small that it is scarcely perceptible.

53,154. Are they caught in the upper part of the loch or in the lower part ?—What herrings do you mean ?

53,155. That larger class you spoke of ?—They come up and pass this place into Loch Fyne and subsequently come down here to spawn.

53,156. Were they caught by the trawlers in the upper part of the loch or in the lower part ?—They are caught here and would be caught in any part of the loch if the trawlers were permitted to trawl for them.

53,157. Where used they to take them ?—They have taken them here at the harbour and down the shore in every part of the loch.

53,158. Have you not bought at Inverary from the drift-net fishermen fish of that quality and size ?—I never bought 500 as large as I have got from the trawlers.

53,159. Can you say what proportion they formed of the whole take of the trawlers in the course of a year ?—I consider that in many seasons the trawlers caught more than the drift-net men.

53,160. But I am speaking of the larger class of herrings; what proportion did it form of the whole take of the trawlers; would it form a large proportion of their take in a whole year ?—Taking the two ends of the season, taking the latter end and the early part it would form a very considerable proportion. They are only caught coming up and going down, and they are rarely in much finer condition than they are when they are coming up the loch.

53,161. I thought you said they were caught only in the early part of the season ?—It is only in the early part of the season.

53,162. They are not caught all through the season in other parts of the loch ?—They go up the loch, but I never saw them trawling up the loch.

53,163. Was it only in the early part of the season that the trawlers used to catch those larger herrings here ?—Yes.

53,164. Had you any interest in the trawl-boats ?—No, none.

53,165. Have you any drift-boats belonging to you ?—No.

53,166. Whereabouts does the gutting take place; does it take place close to the shore ?—It should take place as soon as ever the herrings are taken.

53,167. Upon the beach ?—Yes; but they are much better if they are cured and gutted on board the vessel. The soil does not get at them; they are much cleaner and the gut is thrown away. They are much cleaner and are made up in a superior way.

53,168. Do you mean gutted before they come on shore ?—Yes, gutted when they are laid on the vessel's deck.

53,169. In the curer's vessel ?—Yes; there is only a small proportion of herrings cured here. I never cured herrings on the quay here. I always had a vessel and cured them on board. Once or twice I may have had the vessel's deck quite full so that they could not take any more and then we had to take them on shore.

53,170. Where were your vessels lying then ?—In the harbour.

53,171. Did they throw the gut overboard ?—Yes.

53,172. (*Mr. Caird.*) You seem to be rather an exception among curers as to your opinion in favour of the trawled-net herrings ?—Yes, I am very glad to be an exception in the view that I take because I find that few of those people have had any experience whatever.

TARBERT.

N. Bannatyne.

24 Sept. 1864.

53,173. But I am correct in saying that you are rather an exception among curers as to your opinion of trawled-net herrings; is that not so?—Yes.

53,174. Can you give us any good reason why if the trawled herrings are as good as the drift-net herrings a large body of the curers should be so adverse to that system of fishing?—They object to it because it throws a large quantity of fresh herrings which are obtained by trawling into the market. They are carried away by the railway and sent to all parts of the country, and one consequence is that there is no demand for salt herrings. Of course the people will not buy salt herrings when they can get fresh herrings so much cheaper. There is an additional expense of 10*s.* attending cured herrings, and the curers of course expect to get a profit on every barrel that goes to Glasgow. It is easy to understand that when fresh herrings can be taken to the market 10*s.* cheaper per barrel than cured, that they can be sold at a cheaper rate to the public. Instead of herrings being sold for a penny or three farthings or a halfpenny each they would be sold at two for a halfpenny.

53,175. I understand from the previous evidence you have given that you only become a purchaser at a profit either of trawled or drift-net herrings when the price is low?—Yes.

53,176. Would not that be an advantage to the curers as well as to you?—Yes.

53,177. It cannot be to the advantage of the curers, who can only make a profitable trade when the herrings are at a low price, to advocate a system which makes herrings very dear, and therefore, unsuitable for their purposes?—That is why I think they are acting very blindfold in the matter, and why they were wrong in petitioning for trawling to be given up. I believe that now with a few exceptions they say they are sorry that the Bill passed, and I believe they are all unanimous in wanting the month of January to be an open month.

53,178. With regard to the close-time there seems to be a change of opinion?—Yes.

53,179. But not so much with regard to trawling?—I am quite convinced that they will change their opinion relative to that also.

53,180. (*Mr. Lefevre.*) Since trawling was put a stop to, do you think the proportion of fish taken and brought into Tarbert is the same, compared with the whole take, that it used to be?—Not one-tenth.

53,181. Do you think that a larger proportion of fish is brought into Inverary and other ports of the loch than there used to be?—I don't think that the proportion is any greater with the drift-nets in Inverary than it used to be.

53,182. Then where is the loss of the Tarbert men made up?—The herrings come and go. I perfectly agree with a remark of the Commissioners who inquired here two years ago when they say that of "all the herrings that come in there are only two per cent. taken."

53,183. You say that the Tarbert men do not get one-tenth of what they used to take?—Yes.

53,184. What places have gained by that?—I don't think there has been any gain at all.

53,185. But take the year 1862 when there was a very large take of herrings here; was not the take larger than you ever had here before?—Yes.

53,186. Did not the Tarbert men get their full proportion of that take?—Well I suppose so; they are never very lazy.

53,187. You think they did?—Yes.

53,188. And they caught the herrings by the drift-net instead of by the trawl?—Yes; they caught them by the drift-net, but if they had had the trawl-net they would have got ten times as many fish.

53,189–90. Even in that year?—Yes; they talk of the herrings not having made up, but there have been herrings at Minard if they could have caught them.

The witness withdrew.

J. Macmillan.

JOHN MACMILLAN called and examined.

53,191. (*Mr. Caird.*) You are a fisherman here?—Yes.

53,192. Have you long been a fisherman here?—Yes, 24 years.

53,193. Have you practised both drift-net fishing and trawl-net fishing?—Yes.

53,194. At present you are a drift-net fisherman?—Yes, and I was formerly too.

53,195. Was it the case when trawling was permitted here that you practised both just as you found the one suit better than the other?—Before there was any prohibition I did so.

53,196. You did not confine yourself solely to trawl-net fishing?—Not at all.

53,197. You always had drift-nets if you found that the fish took better to the drift-nets?—Just so.

53,198. Did you find that a better plan than to confine yourself to the trawl-nets alone?—Yes, we used them according to circumstances.

53,199. Then I suppose you sometimes found that the drift-nets did better than the trawl-nets?—Yes.

53,200. What kind of circumstance was it that led to the use of the drift-nets; was it the state of the atmosphere that made them answer better than the trawl-net?—On moonlight nights there is nothing to be got by trawling.

53,201. Is that because you cannot see the fish?—It is generally because we don't know where we can shoot upon them. Perhaps we may come accidentally upon them and perhaps not.

53,202. But you could not see them moving below the water?—Not if it was moonlight, but the two works can be carried on in a manner simultaneously.

53,203. When the herring-fishing begins in June where do you first begin to fish; on what part of the coast of the loch do you go to meet the shoals coming in?—The matter stands in this way. Perhaps to-night there would be nothing to be felt here, nothing at the head of Loch Fyne, and nothing at Campbeltown; yet the very same night they would get plenty between the head of Loch Fyne and Campbeltown.

53,204. Where do you suppose they come from then?—We are obliged to think, as a general rule, that they have been lying off. There is a great deal of mystery attending the fish. Sometimes they are lying in the deep, and they only go to the shore as the weather permits them.

53,205. We should like to trace the progress of the fish into Loch Fyne. At the commencement of June where do you mostly expect to find them?—We can find them sometimes as soon up opposite Otter Point as we can find them at Campbeltown. That is according to the way in which they strike the shore, but we generally think they come from the southwards up here. We do not go to meet them, however.

53,206. Are you sure that they have come from deep water into the loch?—I am certain of that.

53,207. You do not believe that they are in the loch and that they rise from the bottom?—No, they come from the southward. They do not go like a flock of sheep. They take their time, and they strike the shore just as occasion suits them, according as the tide, the sun, and the moon answer, and also the weather.

53,208. Do you consider there are no herrings all the year round in Loch Fyne?—I consider that there are.

53,209. Do you consider that they spawn in Loch Fyne?—I do not.

53,210. Not anywhere in Loch Fyne?—They used to do it, but not now.

53,211. What is the reason that they have ceased to spawn in Loch Fyne?—That is hard to tell.

53,212. Is it attributed to the use of the trawl; do you think that that would be the cause?—The trawl was never used there except in one season.

53,213. In what part of the loch was that?—From

Inverary downwards. Trawling has been very little practised up in the narrow parts of Loch Fyne.

53,214. Is that the best spawning ground?—I do not consider that Loch Fyne is the best spawning ground at all.

53,215. Then have you never observed them coming in great shoals and approaching from the outer sea into the lower loch and then going on to the upper loch?—We take it as a general rule that they do make their exit up there, and we consider that as a general rule Loch Fyne is a regular place for them to fatten and lie dormant in.

53,216. You were a trawl fisherman?—Yes.

53,217. It is alleged against the trawlers that being mostly down the loch they meet the shoals of fish as they are advancing from the sea and break them up so as to prevent them entering Loch Fyne in as large quantities as they would otherwise?—That is altogether an absurdity.

53,218. If it were the case that the herrings came from the outer sea, and that you encountered the face of the shoal, would you disturb them; do you ever encounter the face of the shoal?—No, only those which strike the shore.

53,219. Where do you get your most successful fishing?—In any part from the mouth of Campbeltown Bay to the head of Loch Fyne. I have been working from Campbeltown to Otter Ferry.

53,220. Generally speaking was the bulk of the fish caught by the trawl, during the time that trawling was permitted, caught close in-shore or in deep water?—Always in-shore at the commencement of the season.

53,221. (*Mr. Lefevre.*) Until what part of the season?—Until the month of August. From the 1st of June until the beginning of August.

53,222. Then do you take them in deep water?—Yes, as far as we go. We take them anywhere we can get them.

53,223. Would you oftener find them in deep than in shoal water after that time?—There is nothing you can perceive them by at the beginning of the season except only as they jump and play about, but after the month of August there is a kind of burning and you can see the fish when they move.

53,224. (*Mr. Caird.*) At night?—Yes; but not until the middle of July or the beginning of August.

53,225. When that light begins to be seen in deep water do you find it more profitable and convenient to go and look after the fish in deep water?—We must take them where we can get them.

53,226. Do they themselves in any way as a matter of rule come in less numbers into shoal water near the shore after the month of August?—Not at all; there is no difference in that respect. They come more abundantly if anything.

53,227. Then is it often or very seldom that you desire to go out into deep water to fish with the trawl?—If we could find the fish inside it would benefit us most to take them there.

53,228. Would it be a great hardship upon the trawl fishermen to be prohibited altogether from trawling at a certain distance from the shore in a certain depth of water outside?—Yes, I consider it would.

53,229. Suppose the law would permit trawling to be followed in shoal water and along the shore, but not out in the deep waters of the bay, would that be a fair compromise of the question?—I should consider it no hardship at all. It is only when we find nothing along the shore that we go into deep water.

53,230. Do you think it would be a hardship upon the trawl fishermen to be limited to the use of the trawl along the shore?—I consider that it would be no hardship.

53,231. It would be no hardship to be prevented using the trawl above Otter Point?—With regard to my own experience I have never done that. I never saw trawlers working there except in one year, as far as I am aware of.

53,232. Then you would not consider it a great hardship?—No, I would not.

53,233. Are there certain states of the weather in which the fish are found in great quantities in-shore in the bays?—Yes.

53,234. In what weather and in what month?—In the finest weather. It depends upon the wind and the weather, and the tides too. There are times when we get lots of fish near the shore, but if a heavy gale comes on, such as has been blowing for some time past, the herrings rise and go to the deep water; and we will not see them either in deep or shoal water.

53,235. If a heavy gale and sea set on this shore, you do not find the herrings in the bays where that heavy sea is running?—No.

53,236. Then you would not look after them?—No.

53,237. What distance from the shore would be the limit within which you could work your trawl with advantage without interfering with the drift-net fishermen?—We never see the drift-net fishermen at all when we are working with our trawls. The drift-net fishermen do not come within the points at all, because they dare not do so. They cannot fish there.

53,238. Why not?—Because they would lose their nets. There is a man here whom I can point out who lost 10*l.* worth of nets in consequence of shooting too close in-shore.

53,239. Were his nets caught by the tide and driven on the rocks and torn?—Yes, he lost 10*l.* worth.

53,240. Do you mean to say, therefore, that the drift-net fishermen, if they knew it, would not set their nets where the bottom of the net would touch the ground?—Not within miles of it where there are headlands that could catch them.

53,241. He must set his nets so that they would drift clear of the headlands?—Yes.

53,242. Within such limits would you think it of advantage to use the trawl-net?—Yes; there is not a drift-net fisherman who dare set his nets inside the Black or Yellow islands. He must run clear of the shallows.

53,243–4. (*Mr. Lefevre.*) Do they sometimes anchor their nets?—We do, but they do not.

53,245. (*Mr. Caird.*) Would that prevent any damage being done?—Yes.

53,246. Then the drift-nets may go into the bays?—Strangers could not; they have not the tackle for it.

53,247. But you can use them?—Yes.

53,248. You can use your drift-nets in-shore?—Yes.

53,249. Then it can be done?—Yes, in small quantities and with small pieces of net. If we had a large train of nets the anchor would not hold.

53,250. (*Mr. Lefevre.*) But what you do the other drift-net fishermen could do if they had the same tackle?—They have not the boats nor the means of doing so. They will not do it because they have three times as many nets as we have. It is only a small piece of net that you can shoot between the nets, because otherwise the anchors would not hold.

53,251. Are the nets of the drift-net fishermen deeper nets?—I don't say anything about the depth, our nets are just as deep; what I refer to is the length.

53,252. (*Mr. Caird.*) What distance from the shore would be sufficient to enable you to make a good sweep with your trawl-nets?—That would just be according to where we should see the fish and whether we saw them in the water or whether we saw them playing and jumping about. Then we could form a proper idea, but as a general rule we never draw them at the beginning of the season. We used to draw the bay without seeing anything at all, and we have got some of the large herrings. In the years 1846 and 1847 and from that up to 1852 or so we used to draw in the beginning of the season without seeing any appearance of the herrings at all. I have seen the time when we have been taking half the full of this room without seeing anything either jumping or playing about. That was just trying our chance,

TARBERT.

J. Macmillan.

24 Sept. 1864.

53,253. (*Mr. Lefevre.*) What distance from the shore was that?—About 60 fathoms.

53,254. (*Mr. Caird.*) Are we to understand that the luminous appearance in the sea does not show itself until the month of August?—About the 22nd of July. It depends upon the water, but it is generally about the 22nd of July that we begin to look out for the herrings in the water.

53,255. It is alleged against the trawlers that they take herrings which are half grown or immature, and a great number which are unfit for food. Can you from your experience tell us whether that is the case in the fishing during the present open months of the year since the close-time was established in the spring months?—It is not, but previously it was.

53,256. Do you not catch those small fish during the open fishing months?—No, nothing of the kind.

53,257. Is there any large proportion of the fish which you do catch that are very small occasionally?—No, none. We may get perhaps one or two which have become rolled into the nets but they are not caught properly. They have merely become a kind of fixture in the net.

53,258. Have you observed when you were hauling the trawl that many small fish escaped through the meshes and got away?—None that I am aware of. They did not get away. I have never seen them. In fact they were almost always just of the same size. I never saw any small ones jump through.

53,259. But you have seen small herrings amongst the large ones in your trawl-nets?—Yes, but not many according to the quantity taken. I never saw with a proper mesh—I mean a mesh of the proper size—anything run through in that way. I should consider them very useless if they were able to get through.

53,260-1. You admit that sometimes in a shoal of herrings there are large and small fish?—In general they are about of a size. If there is a right shoal of fish coming in they are about of a size.

53,262. They are all of about an equal size?—Yes, there is very little difference.

53,263. You do not mean to tell us that there are not sometimes smaller herrings caught along with the larger herrings?—There are exceptions, but there are no fish so far different from the others that they would run through the mesh.

53,264. Do they vary much from month to month; from June until December is there any decided change in the size of the herrings you catch?—When we were working at trawling as a trade here, in the months of June and July, I would defy any man taking five boatloads to get a small herring among the whole five loads.

53,265. Would it depend at all upon the size of the mesh of the net that you use?—No, I think not.

53,266. Do you not consider it to be important that a certain standard mesh, below which you should not be permitted to fish, should be established?—Yes, I do.

53,267. What should that standard be?—A square inch.

53,268. An inch mesh?—Yes.

53,269. The same as the drift-nets?—Yes, exactly so.

53,270. If that regulation were established among you and enforced, would it prevent you from catching to any extent small herrings?—Most decidedly it would, but I do not consider where there is a body of fish that there is any quantity of small herrings with it. As experienced men we know the size mostly of the herrings when we look at them in the water or see them playing. We know exactly what the kind is, and we do not shoot at all among them if they are only small herrings; we know at once whether they are sile or good herrings.

53,271. If you did get among the sile would your nets catch them?—No, they would go away.

53,272. Would not the net catch them if you had a large haul, and they got mingled with the other fish?—No, we should take none of them at all in the trawl-net. The mesh expands; it does not diminish at all.

53,273. Is it the fact that in the month of December, and towards the close of the season, the herrings get smaller?—No, it is not.

53,274. Are there not some months when they get smaller?—There are particular species of them that are small; they are not all large, every one of them.

53,275. If it is said that in the month of December in a certain year boatloads of herrings, barely the size of sprats, had been taken and sold at 9*d.* per 1,000, can you say whether it is true or not; have you ever seen that done?—No, I never saw anything of that kind.

53,276. Have you ever seen boatloads of these very small fish taken by the trawl-net at all?—Yes, but they were taken by cuddie-nets; those nets we use for fishing cuddies.

53,277. What time of the year was that?—I do not know.

53,278. Was it during the herring-fishing?—It would be about the month of May.

53,279. Since the close-time was established has anything of that kind been carried on in the open season?—No, it could not be done. There is not a trawl in Tarbert now; there is nothing of the kind.

53,280. Have you ever with your trawl-net disturbed the spawn of fish?—Never. I never saw the spawn of herring taken up.

53,281. Then if you never saw it, you do not admit that there is any truth in that assertion?—I have never seen it. Any man may take up a full fish and see spawn in it, but I never saw the spawn taken up off the ground where the fish had been spawning.

53,282. Have you observed whether the herrings which have been taken by the trawl were more injured than those taken by the drift-nets, and were thus less suitable for the market?—When trawling was allowed I have seen the most beautiful herrings I ever saw in the trawl-nets. I have never seen anything equal to them.

53,283. Has there been any change in that?—Well, since trawling has been prohibited, there is no doubt that the herrings sometimes do not look as well. When you require to do a thing quickly and abruptly they would necessarily not look as well.

53,284. Is there anything in the fact of the herrings meshing themselves and being kept separate from the other herrings to a certain degree that would keep them in a better condition than when they are drawn in in a lump and thrown to the bottom of the boat in a large mass?—No, in point of fact the one is better than the other.

53,285. Then is there nothing in the allegation that those which mesh themselves bleed themselves?—No, that is an absurdity, and it is impossible for any man of common sense to think so. I never saw a drop of blood on the gills of a fish in my life.

53,286. Have you seen it on the net?—I have seen it among whitings. I have seen lumps of blood on taking the hooks out of their mouths, but in net-fishing I never saw anything like blood.

53,287. Is it not the fact that they are thrown in large heaps at the bottom of the boat mixed up with water and dirt, and that they are apt to be injured when they are caught in the trawl-net?—Not if any care is taken of them. You must always take care of the fish.

53,288. It is possible to do that?—Yes.

53,289. If you were allowed time you think it would be possible to adopt such regulations as would enable you to preserve the fish in good order?—Yes, they would all be in good order if every man had time allowed him to take care of his fish. The better a fisherman does his work the more he gets for his fish. If he does not take care of them he must suffer the consequence.

53,290. You said just now that you have had large hauls of fish that would half fill this room?—Yes.

53,291. Have you frequently had such large hauls

that you were unable to take the fish away, and that vast quantities were spoiled and left to rot in the sea?—I have been present on some occasions when we could not take them away ourselves, but we have got other boats to take them away. We were not very fond of leaving them in the sea if we could avoid it.

53,292. (*Mr. Lefevre.*) Did you find that the drift-boats came and helped you?—Any sort of boats would do so. We did not care what they were. I have often seen one boat get more than she could take when there might be perhaps 20 other boats that got nothing. In that case those who had a large quantity would call to the others and offer them 5*l.* to take the full of their boat up to the quay or half the value of what they take.

53,293. Would the drift-boats come away from their own fishing and do that?—The drift-boats do not come near us. We do not see the drift-boats at all. We have not seen them for months. If our nets were right across the channel we should not come across a drift-net boat at all.

53,294. (*Mr. Caird.*) Does it frequently happen that large quantities of fish are lost from the impossibility of your either getting the means of conveying them or taking them out of your net?—No, it is not true. I never saw that but once, and that was at the mouth of Loch Gare when the cutter came in. Trawling was scarcely prohibited at the time, but it was not altogether allowed. When the cutter came the fishermen went away, and they were obliged to leave their net and all that was in it.

53,295. What happened then?—The men in the cutter raised the net, and in doing so they tore it, not knowing how to lift it.

53,296. Was there a large quantity of fish left there?—Yes.

53,297. Is that the only occasion you remember on which the fish were left by there being too heavy a haul for you to make use of?—That is the only time. We take very good care that we do not go too close at any time in-shore, because if we do we are sure to catch stones, and then our nets would be torn. We take care when we get in a shoal of fish to get a sufficiency of them, and then we secure what we have got.

53,298. What is the largest haul you have ever had at one time?—About 250 maze.

53,299. Of good herrings?—We got 1*s.* 9*d.* a hundred for them.

53,300. (*Mr. Lefevre.*) Would that be about the same number of barrels as maze?—There are 500 to the maze.

53,301. How many to the barrel?—About 800 to the barrel.

52,302. Have you ever known of 1,100 barrels being taken in one haul?—Yes, there was one particular haul which was enormously large. I cannot state the number of barrels, but I know there was an immense quantity. There are some fishermen present now who were there at the time that take was made.

53,303. That perhaps occurs only once in a lifetime?—It is the only one I ever knew of.

53,304. (*Mr. Caird.*) It is not a matter of frequent occurrence that there is a large quantity of herrings taken and lost from the want of your being able to get them in?—No, it is not.

53,305. Have the most of the men who were in the habit of following trawl-net fishing become drift-net fishermen here?—Yes, but in what situation are they?

53,306. Have they done so?—Yes.

53,307. If permission were given to you under certain restrictions to use the trawl-net what would you do, if you had that permission; you as a fisherman have been in the habit of using drift-nets and occasionally of using trawl-nets, how would you proceed so as to work to the greatest advantage to yourself?—I should most decidedly take to the trawl-nets.

53,308. Would you not do both as occasion offered?—I have seen the herrings in the west loch here, as, for instance, in 1847 and 1848, when there was nothing to be done here. There was, however, a fishing begun in the west loch, and we could kill plenty of herrings at 1*s.* 3*d.* a hundred If I had not had a drift-net at that time I should just have been a poor man.

53,309. You could at that time do nothing with the trawl?—Not here. Nothing was done here in the autumn then.

53,310. Speaking of the fishing in Loch Fyne and within Ardlamont Point and Skipness Point, including the lower and the upper lochs, would you follow both as you found occasion, or would you confine yourself to trawling?—On moonlight nights only we should take to the drift-nets. If I had gear I might go, but it would take the whole time to get our nets in order during the time of the full moon, and they might get torn and so forth. We should only be two, or three, or four days idle together. It would be a bother or an incumbrance upon us to be shooting drift-nets and trying them, and then taking them home again. For my part, I consider that we should only follow the one occupation.

53,311. Would that be the case with most of the Tarbert fishermen?—I think so. That is my opinion.

53,312. You would expect of course to make much larger hauls with the trawl-nets than with the drift-nets on the whole?—Yes, most undoubtedly.

53,313. You would expect greatly to increase the catch of fish, would you not?—Yes.

53,314. Would the effect of that being followed by a great body of fishermen be that you would take such large quantities of fish that you would very soon clear the loch of fish altogether?—Not at all. We should only increase the supply without diminishing the stock.

53,315. You think so?—Yes, and I am certain of it.

53,316. Do you think that every year a vast quantity of fish leave the loch that you never catch at all?—They never return.

53,317. Do they leave the loch?—They are a migratory fish, no doubt.

53,318. Have you observed, as a practical fisherman, that sometimes the fish do not mesh well in the drift-nets, and that you could then catch them in the trawl?—Yes, particularly at certain seasons. I do not believe that there has been any scarcity of herrings. I have been for 24 years working at the fishing, and I have never seen more herrings in my life than there are now. They strike our nets and we see them in mountains. They are in enormous lumps together.

53,319. And yet they do not mesh in your nets?—If we shoot our nets we might perhaps get three.

53,320. If you were permitted to use the trawl would you be able to secure good hauls?—Yes, either in the deep or shallow water. We could get them anywhere we tried, and yet now we cannot get one; very often this season we have been obliged to come back without having got fish. In point of fact, there is no use in trying our nets, as it is quite certain that after we have shot them we will only get two or three, and perhaps none at all.

53,321. Do you remember after trawling was put a stop to that the next year, namely, 1862, was one of the most productive fishings known in Loch Fyne?—Yes, in the upper loch it was.

35,322. Was there not a good fishing in the lower loch also?—No, the good fishing was up in the upper loch, but they were an inferior quality of fish.

53,323. Where they large fish?—Yes; but they were an inferior quality of fish. They were the worst I ever saw.

53,324. There was a very large quantity taken from the loch by the fishermen altogether?—Yes, there was.

53,325. The next year, namely, 1863, was a very inferior fishing?—Yes, it was a very poor one.

53,326. Do you think that the great take of the preceding year had anything to do with that?—Nothing of the kind; the two were quite distinct.

TARBERT.

J. Macmillan.

24 Sept. 1864.

I do not consider that a shoal of fish coming to Loch Fyne this season is a shoal that comes always. We are under the belief at times that they come three years successively, that is our idea, but it may be erroneous.

53,327. You think they come three years successively ?—Yes.

53,328. Do you mean the same shoals ?—Yes, that used to be our opinion.

53,329. It is alleged that it was in consequence of the total prohibition of trawling that there was such an excellent fishing in 1862 ?—Nothing of the kind.

53,330. Do you admit that that is the case ?—I do not. How has it proved since; where have they gone to for the last two years ?

53,331. You do not admit that trawling has anything to do with the strength of the shoals as they come into Loch Fyne or the general take of fish in one season or another ?—No, and I do not consider it prejudicial in any manner. I believe that it always made the supply greater.

53,332. (*Mr. Lefevre.*) Do you think the fish were in abundance in the loch last year and that they were not caught by the drift-nets ?—Yes, they were here.

53,333. Would you have had a good take of fish last year if trawling had been permitted ?—Yes, we should.

53,334. Did you give evidence before the Commissioners about this time of year in 1862 ?—Yes.

53,335. Up to that time there had only been a very small take of herrings ?—Yes, it was very small up to that time.

53,336. But later on in the season you had a very great take indeed ?—Yes.

53,337. Do you think it is possible that there may still be a great take of herrings in the loch here this year ?—There are more herrings to be seen this season than ever I have seen during my experience; and that has now extended over 24 years.

53,338. Is it not possible that the drift-boats may take them in the latter part of the season ?—No, they will not.

53,339. Why is that ?—I cannot tell, but if they get a few of them it is only by placing the drift-nets so close to the shore, in point of fact right on the rocks, that there is no possibility of their escaping.

53,340. But the drift-nets in 1862 caught them in the latter part of the season. Could they not do the same this year ?—They have not gone into Loch Fyne; they are in the roadstead here. There are plenty of herrings here, but those herrings that are here are not the same as the larger sized herrings which go to Loch Fyne.

53,341. Do you think as a rule that the fish in the loch in the earlier part of the season leave it, and are replaced by another class of fish ?—No; the shoals go there, and if there is not another shoal going in among them to make them work, they will not work.

53,342. Do you mean that the fish that go there in the early part of the season stay in the loch during the whole of the season ?—Yes, I think that is the case until the month of December or so.

53,343. When they begin to migrate ?—Yes.

53,344. Did you begin trawling in the year 1846 or 1848 ?—I was trawling in 1846.

53,345. What number of men were there at work trawling at that time; can you recollect ?—No. In 1846 there would not be more than 30 boats.

53,346. Did they greatly increase in number ?—Yes; there was a great increase.

53,347. Were nearly all the men at Tarbert trawlers at one time ?—They were nearly all trawlers here. There may have been one or two drift-boats.

53,348. Are you able to say what was the greatest number of trawl-boats in Tarbert ?—I should say that there were at one time about 60 or 65 boats.

53,349. At the same time was there a considerable number of drift-boats worked by the trawlers ?—No, there were very few drift-boats worked by the trawlers. When trawling was going on I should say that there were not for some years more than 15 boats.

53,350. The fishermen here occupied themselves solely in trawling ?—Yes, always in trawling when trawling was allowed.

53,351. When trawling was prohibited did they continue to use the same boats for drift-net fishing which they had used for trawling, or had they to buy other boats ?—Those who could afford to buy other boats did so.

53,352. Were the boats not well adapted for drift-fishing ?—Yes, they would do very well at home, but they were not adapted for going from home.

53,353. You are not able to take them any distance from home ?—No.

53,354. Have most of the trawl fishermen here provided themselves with boats and nets ?—They have generally the old boats, but some of them have bought new boats.

53,355. Have a great number of them bought new boats ?—Yes.

53,356. And they have provided themselves with nets ?—Yes; but I am sorry to say that they have to be paid for yet.

53,357. Have they borrowed money to pay for them ?—No, they have not got the money to pay for them. Perhaps one or two young men may get a few pounds worth of nets from some of the merchants here, but a married man with a family will not, or dare not go to look after them in that way. It would be expected that he could not pay for them, and they would not let him have them.

53,358. Have many of the fishermen left this place in consequence ?—Yes, a great many.

53,359. Are they mostly the younger men ?—They are the younger men in general. Those who could do it have gone; of course, if a man is in debt he dare not go away.

53,360. Is the trawling a business at which only the younger men could work ?—All persons could work at it, and it is the most productive mode of fishing in existence; and further than that it does less harm than any drift-net fishing. The way in which we work now with the drift-nets in order to enable us to get a few hundred of fish leads to more destruction among the herrings than all the trawling I ever saw carried on. The first boat that comes gets a small shoal of herrings right in-shore; as fast as she can she shoots three pieces of net. She has her net perhaps in three pieces.

53,361. That is the drift-net fishing ?—Yes; she goes in close upon the heel of the shoal, I follow, and I am as active as my predecessor. He goes in and hammers away as fast as ever he can, trying to put a few of the fish into his own nets, but that mode of fishing in my opinion would spoil all the shoals on earth.

53,362. You think that the drift-net fishermen if they are so minded can spoil the shoals of fish more than the trawlers ?—Yes, most distinctly. If I was trawling I should go to the fish cautiously, and work the thing easily and cannily without making much noise, because the less noise I made the better it would be for myself.

53,363. Are there any trawlers in Tarbert now ?—Not one.

53,364. Did they sell their trawls at a great loss ?—No, they had them shut up in other ways. In point of fact the Government has most of them now.

53,365. Was there much trawl-fishing above Otter Point ?—Not more than one year, that was all.

53,366. What made you go up that year ?—I did not make a pound by it.

53,367. What made you go up ?—There was nothing to be got here at that time. The herrings had all gone there. There are years when, do as we will, it is not always when we like that we can catch them.

53,368. But if you went into the upper loch you must fish close to the drift fishermen ?—Not at all. A trawl-net has nothing to do with drift-net fishermen at all. It does not come into contact with them at all.

53,369. But in that year all the drift-net fishermen

were at work in the upper part of the loch?—Yes, but a great many of them had dropped it. The fleet was not very heavy then.

53,370. But where the water is very narrow, would you not come close to one another?—A drift-net fisherman must not go close in-shore, because if he does he will get his nets torn. They go running along with the tide, but if they go too close in-shore and come across the least foul ground they will catch the bottom and have their nets destroyed. They are often crawling along and perhaps sleeping all night.

53,371. Are the drift-nets not often set within 100 fathoms of the shore?—No; but there are only Tarbert men between this and Campbeltown.

53,372. I am talking now of the Upper Loch Fyne?—There are some of them who shoot what they call trammels or pieces of nets.

53,373. They are anchored, are they not?—Yes, when we call them trammels they are anchored.

53,374. But I mean drift-nets. Are not the drift-nets often set within 100 fathoms of the shore?—Yes, in Loch Fyne, because the water is bold and deep.

53,375. Is it possible for trawl-nets to be shot there without interfering with the drift-nets?—Yes, there would be more room than I should require by a great deal. If the herrings in Loch Fyne are in-shore you could not shoot your nets as close in as they are, for the shores are bold and deep and the bolder the water the closer in they go.

53,376. Would the trawlers go closer in?—No, the herrings themselves. The drift-nets cannot be shot there. You could not shoot in a small place with them. You must have a regular distance in order to shoot drift-nets.

53,377. Do you mean that they could not shoot in the small bays?—No, they must take their proper length and keep a certain distance from all the jutting points, or otherwise their nets would be destroyed.

53,378. Was it a great disadvantage to the trawl fishermen to be prohibited from trawling in Upper Loch Fyne, say within Otter Point?—We should like to get the work carried on anywhere, and I consider that it is not right to prohibit it anywhere. The fishermen of the upper loch fish with us simultaneously, and the two works could be carried on simultaneously quite well.

53,379. Even in the upper waters of the loch?—Yes.

53,380. And in the Kyles of Bute?—Yes, anywhere.

53,381. Did the Tarbert men trawl much in the Kyles of Bute?—Yes, at the latter end of the season, We trawled wherever we could find fish.

53,382. Did you trawl at all during what is now the close-season, namely, during January, February, March, April, and May?—Yes, we did.

53,383. Did you trawl in the Kyles of Bute at that time?—No. There was one year that the trawlers were working there.

53,384. Was the take of fish very small?—They were rather inferior I understand. I was not there, but I believe they were rather inferior at that season.

53,385. How far to the south would the trawlers go down towards Campbeltown?—We have been to a place called Carradale. We could work anywhere if the wind and weather permitted. We could work on any shore if there was clear ground, but in general we never pass what they call Carradale Point. It is too far for us.

53,386. Do you think the trawl fishermen made more by trawling than by drift-net fishing on the whole?—Yes.

53,387. What would you make in comparison?—Since trawling has been given up we have not got five per cent. of what we got formerly.

53,388. Have you not got more than that this year?—No.

53,389. Take 1862. What did you get then?—I should consider that we only got 15 per cent. of what we got in 1849 and 1850.

53,390. Even in 1862?—Yes, in 1862 I consider that we did not get more than 15 per cent. of what the Tarbert men made in 1849, 1850, and 1851.

53,391. In 1862, when you were examined, you gave the proportion that the drift-net fishermen would make at 50*l.* a year and with the trawl-net 80*l.* a year; is that a fair comparison?—Yes, it is; but the expenditure of the one is not to be compared with that of the other.

53,392. You have to pay much more for your nets and boats for drift-net fishing than for trawl fishing?—Yes.

53,393. Then you have not taken that expenditure into your calculation when you made that comparison?—It would be a very successful man at a third share who would make 50*l.* He might have made that in 1862.

53,394. Do you recollect what you made in 1862?—No.

53,395. Were the Tarbert men not as successful as the Inverary men?—The Tarbert men would get more fish with six barrels than the Inverary men would do with a hundred.

53,396. Can you explain why it was that the Inverary men have not taken to trawling?—It was because they were not qualified for the work. They cannot do it; they are too lazy.

53,397. Are they not as successful as you with the drift-nets?—No, they cannot do it; they are a sleepy set of men and they cannot catch as much.

53,398. Do you fish all the year round?—Yes.

53,399. Do you fish with the line during the close-season?—Yes, I can work with any sort of fishing gear, of whatever description.

53,400. Have you found the supply of white-fish falling off, and the supply of haddock, cod, and whiting?—Yes.

53,401. When did whiting and haddock begin to fall off?—I cannot tell you. At one time we used to go out in the west loch and we sometimes got 80, 100, and 120 stone of whiting and haddock in the Sound of Jura.

53,402. Did you fish mainly on the other side?—We fished in all places, but I allude now to that particular spot.

53,403. Speaking generally, when did they begin to fall off?—About five years ago.

53,404. Have you been taking small quantities of them lately?—There were boats from here that went last year and all they got was two small whitings.

53,405. Was it the same with the haddock?—Yes, there was nothing at all. Two were all they got, and I saw them floating in the water.

53,406. With regard to the hake how was it?—That was better last year.

53,407. Have you sustained any loss through not being able to get herring bait during the close-time?—No doubt there is a loss in that way.

53,408. What bait have you used?—Generally herring bait. We have got herrings either by hook or by crook; that is the fact of the matter.

53,409. Then you have not sustained any loss from that?—Yes, the bait was inferior.

53,410. Did you buy it from the east coast?—Yes. If we pilfer them we must do it in a stealthy way.

53,411. Cannot you get it as fresh as if you were allowed to fish for it?—No; if you take any fish and send them any considerable distance, herrings in particular, you will find all the scales rubbed off them, and bait, particularly herring bait, must be well scaled or the fish will not have it. Eels are a very particular fish in that respect.

53,412. Then do you think it would be desirable that you should not be allowed to catch herrings for the purpose of bait in the close-time?—I am not an advocate for a close-time, but I consider, and I believe that is the opinion of most of us, that from the 1st of February to the 1st of June, together with permission for us to trawl, would be sufficient for us.

TARBERT.

J. Macmillan.

24 Sept. 1864.

53,413. You would have a close-time from the 1st of February until the 1st of June?—Yes.

53,414. In the meantime you would allow herrings to be taken for bait?—Yes, but not for the market.

53,415. Would it be possible to allow the one without also practically allowing the other?—Quite, and I am fully convinced that for our part here, speaking now of the Tarbert men, there would be nothing of the kind seen in any shape or form.

53,416. You think they would not catch the herrings for the purpose of sending them to the market?—No, they would not.

53,417. If you were allowed to take them for the purpose of bait and took more than was required for that purpose what would become of the rest of the fish?—They would be thrown overboard.

53,418. Would the fishermen have sufficient strength of mind to throw them away?—They would because they would be compelled to do so.

53,419. Would they not try to dispose of them in the market?—No, there would be no market.

53,420. You are opposed to the close-time as it is at present enforced?—I approve of it in a manner, but I think the open season might be extended.

53,421. What would be the proper time for a close-time?—In the months of April and May on the west coast the fish are inferior, because there are small shoals of young herring which come upon our coast and feed there. They are a very voracious fish at times and they feed on the animalculæ or small stuff they find in the water.

53,422. What sized herrings are they; are they quite small?—Yes, and they go close in-shore and get so stupified that they might be caught with anything. They are of no use for food.

53,423. They are of an inferior kind, and are of no use for food?—The large ones feed upon them. There is a kind of substance in their bellies which seems to eat up the fish. If you allow them to lie for a day they go quite bad.

53,424. Are they small herrings?—Yes, and large ones too.

53,425. Are not the large herrings in a fit condition to eat at that time?—They are very seldom caught on this coast at that time.

53,426. Do you think the herring spawns in Loch Fyne during the close-season?—No, I do not, and I do not consider that there are any herrings at all that spawn in Loch Fyne.

53,427. Do you think the herrings are in Loch Fyne at all in the close-season?—The regular good herrings leave Loch Fyne every season when it comes round.

53,428. What herrings are there in Loch Fyne during the close-time?—They are of an inferior quality.

53,429. In bad condition?—They are spent fish. There are no good fish in any part about this coast during the close-season.

53,430. If they are spent fish where do they spawn?—There is not a large quantity of them; there are very few.

53,431. Then would it be worth while to go out and catch them?—You would not get them if you did.

53,432. Neither in the trawl-net nor in the drift-net?—By any meshes you like to invent you would not get them at that time.

53,433. Have you found cod with herrings inside them at that time?—Yes.

53,434. Have you often observed that?—Yes.

53,435. In February, March, and April?—Yes.

53,436. How high up in the loch do you catch the cod?—We never made it a practice to go there. In the spring of the year we always fished outside here or on the west coast.

53,437. Whereabouts do you fish on this side?—Between this and Arran and the back of what we call the Inch.

53,438. Do you fish immediately off Tarbert for cod?—Yes.

53,439. How many fishermen are there here occupied in line-fishing for cod during the close-time?—About 20 boats.

53,440. Are they large boats?—There are about 20 large ones. There may be a few small ones, but it does not pay them.

53,441. Then it does not occupy all the fishermen who fish for herrings?—No.

53,442. What becomes of the rest?—They do as they can.

53,443. Do they work as labourers?—They are not accustomed to work as labourers, but they can do it.

53,444. Do they do nothing?—Every man has to shift for himself when it comes to that.

53,445. (*Mr. Caird.*) You talked of the herrings at certain times "working." Will you explain what you mean by that?—What we call working is when they go into the nets. There are times when they work better than others, and it is according to the state of the moon and the state of the tides that the herring comes up to the surface.

53,446. They lie dormant at times?—Yes. We neither see nor feel them during the turn of the tide.

53,447. They then begin to move?—Yes.

53,448. And you call that working?—Yes. If the moon begins to rise about 7 or 9 o'clock at night you would not think that there was a herring in the water or a living fish at all. When the moon begins to peep they come up and generally the tide and the moon go together. The reflux of the tide is according to the rising of the moon. In general they begin to play, and then if you have a chance at all you will get a few of them at that time.

53,449. That is what you call working?—Yes.

53,450. You said that a fresh shoal of herrings comes in and mixes with the herrings causing them to work?—Yes.

53,451. Does anything that agitates the mass make them work?—Yes.

53,452. (*Mr. Lefevre.*) When you were working in the deep water, and taking a large quantity of fish, have you observed many drop from the trawl dead in consequence of being jammed and squeezed together?—No, never. There might be a hole in the bag of the net that would allow them to go through, but they would not go through in any other circumstance.

53,453. Would those fish be alive or dead?—They would be alive, but they cannot get out as long as the net is whole. It forms a bag.

53,454. When you use it in deep water cannot they get away until you get the net close to the boat?—Yes, until you get them just into the boat.

53,455. Would they drop from that dead in consequence of being squeezed up and jammed together?—No, they are all living, and they could easily make a descent if they liked even when they are in close.

53,456. (*Mr. Caird.*) Do you catch any other kind of fish except herrings in your trawl-nets?—Yes.

53,457. What other kinds of fish do you catch?—Dog-fish.

53,458. Do you catch many dog-fish?—Great quantities of them.

53,459. Are the dog-fish ever caught in the drift-nets?—Yes.

53,460–3. Do they mesh themselves?—Yes, they do. Some strangers went out this night fortnight, and they got an immense quantity. They were Ballantrae men. There are no Tarbert men who go out on Saturday night. I believe these men I am speaking of got such an immense quantity of dog-fish into their nets that their nets were quite spoiled. Two crews had to go out and fetch the nets in.

53,464. With regard to salmon, do you ever get any salmon in your trawl-nets?—No.

53,465. Or salmon trout?—No, nothing of the kind.

53,466. Were there a great number of trawl-nets used here with the mesh less than the legal size?—Yes.

TARBERT.

J. Macmillan.

24 Sept. 1864.

53,467. Was that at the beginning of trawl-fishing?—Yes, at the time it was a legal business; they were always 36 to the yard. It would be of no benefit to the fishermen themselves to have a small mesh. The larger the mesh the better fish they get.

53,468. What made them alter it?—They altered it when there was a prohibition made, because then the sooner they could get off with their work the better. They tried to put a couple of nets into the middle of the net so that there should be no fish meshed in them. When they drew the nets they went away with them as hard as possible.

53,469. The herrings do not mesh in the trawl-nets?—No, not as a general rule.

53,470. Then, in that case, you may have caught a large number of small fish?—Yes, that may have been the case; but we have more trouble in taking out those which mesh than anything else.

53,471. What was the smallest class of fish you caught when you used the legal mesh; did you catch them of seven inches in length?—Yes, I think so. The 7-inch herring is not a small herring provided it is in good order.

53,472. Do you take them less than that when you use a legal mesh?—Not commonly.

53,473. But when you adopted the smaller mesh, what was the size of the herrings you took then?—We could take any sort of fish at that time.

53,474. Quite small fish?—Yes, but not extremely small. The smallest thing ever I saw that you would try to take to market would run about 1,500 to the barrel or box.

53,475. Were there a certain number so small that you would not send them to market?—No, I never saw that.

53,476. Did you ever try to work the trawl-net in the daytime?—Yes.

53,477. With success?—Yes, but in general in the daytime it is an inferior quality of fish that we get.

53,478. How, in point of size or in condition?—Both in point of size and condition. I have known one year when we could not get anything if we did not get them in the evening.

53,479. Could you ever see the shoals of fish from the high lands about; could you see them in the water and then go out with your trawl-nets?—No, but we can stand on the shore and see them. We go ashore and then look at the bays, and every man would mark out for himself the place he wished to fish in. We could see the fish playing and jumping about in the water.

53,480. Apart from the jumping could you see any appearance in the water that would indicate a shoal of fish?—I have often seen herrings in lumps below me.

53,481. When you have been on the bow of the boat looking over?—Yes.

53,482. But not from the high lands on shore?—No.

53,483. Are you able to detect a shoal of fish coming in?—Not that I am aware of.

53,484. You never saw anything of that kind?—No, they do not make the water swell, but I have seen lots of them jumping and playing about.

53,485. Have you ever thought when the drift-nets have been set in great quantities that they prevented the shoals of fish from coming in-shore?—I have no hesitation in saying that it would be very injurious to shoot nets of any description during the daytime.

53,486. But how is it during the night-time?—During the night-time the fish will go in-shore or keep out as they like.

53,487. You do not think the drift-nets hinder the fish from going in any direction they like?—Not at all, if they are set there at the proper time, but I consider that the proper hour for shooting drift-nets is in the evening about the time of sundown. It would be very injurious to shoot them before.

53,488. On what ground?—On various grounds.

53,489. What are your reasons?—It makes them go down and they escape.

53,490. Are the men who do that not so likely to catch fish?—On the whole we consider it is prejudicial to the fishing to begin to shoot the nets in broad daylight. There may be herrings there. You may see them playing in the water, but whenever they see the nets they take to the bottom, and they have plenty of means of their own to escape.

53,491. Would that frighten the fish out of the loch, and would they go away?—They would not be a bit the better for it. In narrow places it would have that effect.

53,492. Are the fish frightened by the luminous appearance of the drift-nets?—Yes, no doubt they are.

53,493. Do they leave the loch on that account?—I do not say they leave the loch, but I have seen them crossing in the loch. On a stormy night you may see a train of nets and the fish all in a body on one side; the burning appearance in the water makes them go like a drove of sheep on each side of the net, but not one of them would touch it.

53,494. Are they often frightened by the trawl-net?—The trawl-net does not allow them to get much time for consideration.

53,495. Does it take all it frightens; do you mean that?—They may be frightened enough, but they do not get time to consider what they are to do.

The witness withdrew.

JOHN MACLEAN called and examined.

J. Maclean.

53,496. (*Mr. Caird.*) You have heard the evidence which has been given by the previous witnesses?—Yes.

53,497. You are a drift-net fisherman now and you were a trawl-net fisherman at the time trawling was permitted?—Yes.

53,498. You have had considerable experience of the fishing in Loch Fyne?—I have had experience of it during the last nine years.

53,499. Do you think the state of the law as it exists at present has been injurious to the general supply of herrings in Loch Fyne?—Yes, I do. I consider that it is very injurious to the fishing in general, and also to the interests of the consumers.

53,500. Has it prevented a quantity of fish from being taken that would otherwise have been taken if trawling, as a mode of fishing, had been permitted?—It has.

53,501. Are you aware that a very large fishing was got in Loch Fyne in the year 1862, when there was no trawl-fishing?—Yes.

53,502. Do you imagine that if the trawl-net fishing had been permitted that large take would have been considerably increased?—I consider that there would have been ten times more fish taken.

53,503. Were the shoals of herring that came into Loch Fyne that year unusually large?—Yes, they were very large, but very inferior in quality that year.

53,504. Did they vary very much one month with another that year?—The fishing was not as good in the lower part of the loch but it was very good in the upper part. The water is very narrow and contracted there.

53,505. Were you in the habit of fishing when you were allowed to trawl occasionally with the trawl-net and occasionally with the drift-net?—It was very seldom that I used the drift-net until I was compelled to do so.

53,506. You did not use the drift-net until trawling was prohibited?—No.

53,507. You found that the trawl-net was more

TARBERT.

J. Maclean.

24 Sept. 1864.

productive and that it paid you better?—Yes, I did, decidedly.

53,508. Do you admit in any way that the system of trawl-net fishing has a tendency to break the shoals of fish when they are entering the loch?—No, I do not. I do not concur in that statement at all.

53,509. You are aware that such a statement has frequently been made?—Yes; that has been alleged several times.

53,510. But you have never seen anything of that sort yourself?—No. I can prove that the drift-nets do more damage than trawling.

53,511. In what way?—If the herrings are coming into Kilbrennan Sound there may be 200 boats going out with 20 or 30 pieces of net in each boat, and they shoot these trains early in the evening and break the shoals in such a manner that they return to the open sea. I believe the drift-net is the chief instrument that ever breaks the shoal and not the trawl-net; the trawl never did any injury in that way.

53,512. Did you find, as a trawl-net fisherman, that your best takes were got close to the shore?—Yes, always.

53,513. It was only an exceptional case when you went into the deeper waters to fish?—Just so. Occasionally when the fish were surrounding the shore we got very good takes but we did not find much if we were obliged to go into the middle of the Channel.

53,514. When you went out into the deep water you got among the drift-net fishermen?—No, generally for our own interest we kept clear of the drift-net fishermen.

53,515. But did you not frequently fish among them?—No, very seldom, because we always wanted an open berth for ourselves.

53,516. Is it not the fact that when the fish are observed they are generally found within a comparatively narrow boundary,and that the whole fleet of fishing boats resort to that spot?—The drift-net fishermen do not wait to see if there are herrings or not; it is just chance work with them. They put out their nets and let them drift.

53,517. Do they not go where they think there are herrings to be caught?—They generally scatter about in all directions. One person will go to one place and another to another.

53,518. In trawling will a trawl-net fisherman not fish unless he has a strong assurance that he will find the fish?—In the early part of the season they might make an occasional sweep, but unless they saw the fish in the loch they would not go out. They generally made sure work of it before they ever cast out a net.

53,519. Sometimes if they did not see the fish would they fish at all during that evening?—I have seen times repeatedly when they would not. One night the fish might be seen in the water and then they would be all out fishing, but it was repeatedly the case that if they did not see the fish they did not cast their nets.

53,520. There would be no fish caught then if there was nothing but the trawl-net used?—No, there would be no fish.

53,521. Would they be caught by the drift-nets?—There might be a few caught.

53,522. Is it a fact that if the trawl-net system were generally resorted to the supply of fish would be more irregular and that there would be vast quantities at one time and none at all at another?—There would always be a general supply. Of course there would be a heavier fishery sometimes than at others, but there would always be a general supply going to the market.

53,523. If trawling were permitted would most of the fishermen of Tarbert take to that mode of fishing in preference to drift-net fishing and not use the two modes of fishing together?—Yes, they would take to trawling; but it might be for their own interest to try for a few nights in the moonlight to get their trawl-boats and nets put in repair and fish with drift-nets, but I don't think myself that it would be worth their while to be bothered with drift-nets.

53,524. Then at such a time the supply to the markets would be furnished chiefly by the drift-net fishermen?—Yes, chiefly; occasionally the trawl-net fishermen might go and get a few if it was calm.

53,525. Can you state, as a practical fisherman, that there are certain nights in which the fish do not mesh in the drift-nets when you could catch them successfully with the trawl-net?—Yes, this season is an illustration of the matter.

53,526. What is the peculiarity of this season?—I cannot account for it. The herrings are lying dormant and yet they are not meshing. I do not expect that we shall see much fishing this season at all.

53,527. If trawling were permitted could you catch herrings here?—If trawling were permitted there is not a fisherman in Tarbert that would not take from 80*l.* to 120*l.* worth of fish from June to January.

53,528. At such a time as the drift-net fishermen are not taking fish would all that could be taken by the trawl be so much additional to the market that is otherwise lost to the market?—Yes, altogether.

53,529. Would those fish that you would not catch remain to be caught by the drift-net fishermen?—That is hard to say. They may be here to-night, but we cannot tell where they may be to-morrow night. They may get them at other places.

53,530. Have you observed that the shoals come in succession month after month or that the largest shoal comes at the commencement of the season and that you get your supply from that?—I cannot rightly account for that; they may be along the coast from Campbeltown to Inverary yet we may get none, whereas, at another time, they are all over the coast, and we may get plenty. I think they will be dormant at times in the deep, and only occasionally come up to the surface.

53,531. Have you ever observed any spawn in your trawl-nets?—Never, during my existence.

53,532. You do not admit that your system of trawl-fishing is destructive of the spawn of the herring?—No, the herrings deposit their spawn on the foul ground and it is impossible that the trawl could take it on the foul ground; we don't work on the foul ground at all.

53,533. You could not work there?—No, it is impossible that the trawl can sweep on the foul ground.

53,534. Do you kill many of the small immature herrings during the legal fishing season?—I never saw many small herrings captured, unless by a net made purposely for catching them.

53,535. If there was a legal sized mesh of one inch enforced would that obviate to a great extent the objection against trawling that it catches immature fish?—Decidedly it would; it is possible that there may occasionally be a few small herrings among the large ones, but for our own advantage we never interfere with the small herrings if we can avoid it; we only get very little for them, and all practical fishermen ought to know the distinction they make in the water.

53,536. What do you mean by that?—We know the distinction between large and small fish; the one is a solid light fish, and the other is a simple flash.

53,537. Do they not swim together?—Not often, they are a different species, and unless they are compelled to mix with the others in going up the loch they generally keep separate.

53,538. Do you catch a larger or smaller quantity of immature fish by the drift-net fishing or by the trawl-net fishing?—I have seen small fish in the mesh of the drift-net.

53,539. Do they mesh themselves?—No, but they get entangled in the net.

53,540. Does that happen in the case of the drift-net as often as it generally does in the case of the trawl-nets?—I don't suppose there is any great destruction of small herrings at all in trawling, unless there is a net purposely made for them.

53,541. With a mesh of an inch do you not catch

at any time herrings unfit for the market or for consumption ?—No, it would be impossible.

53,542. Are they all marketable herrings which you bring ashore ?—Yes.

53,543. In a net of an inch mesh ?—Yes.

53,544. If that sized mesh were enforced you could not with such a net catch the brood of herrings too small to be useful for food ?—No.

53,545. Would you catch nothing that would be unsaleable in the market ?—No, we should take herrings fit for human food with a legal sized mesh.

53,546. With such a legal sized mesh, and a close-time strictly observed during the spring months, you say that the system of fishing by trawl-nets cannot be injurious to the brood or spawn of fish?—No, it cannot be, but I don't think the close-time is of any benefit at all to the fishing ; I don't see that it is requisite because I believe there are more herrings destroyed by vermin in the spring months than by all the engines which man could invent to catch them.

53,547. Is that in the open season ?—All the year round.

53,548. All the year round ?—Yes ; I think we ought to be allowed to catch them for bait.

53,549. But except for bait, is there a great demand for the fish you could catch in March and April ?—I would not advocate April or May for an open season, but January, February and March might be left open. I have seen good herrings caught in those months which would sell very well in the English market and bring 5*s.* a hundred ; they were spent herrings.

53,550. (*Mr. Lefevre.*) In what month ?—March.

53,551. (*Mr. Caird.*) And they sold readily in the English market ?—Yes.

53,552. Do you think taking them at that time is not at all injurious to the fishing when the fish are in better season ?—It could not be injurious ; there was no spawn in the fish ; they were only spent fish.

53,553. Would not those fish have got into better condition if they had been left ?—Decidedly they would.

53,554. Then to that extent there was a disadvantage in taking them at that time ?—There was no disadvantage, because there was plenty of them.

53,555. Have you ever come into collision with the drift-net fishermen when you have been trawling? —No ; except once at Otter Point when they came to put us out of the loch.

53,556. What part of the loch ?—At Otter Spit.

53,557. Above the Spit ?—No, just at the Spit itself.

53,558. Were you the aggressors ?—No ; we were lying at anchor when they came down, 13 in a boat, and wanted to take our property from us, but we would not allow them.

53,559. You say as a practical fisherman that the two systems of fishing, trawling and drift-net fishing, could be allowed to go on without any obstruction the one to the other ?—Yes ; both could be wrought simultaneously if the parties were agreeable, but they do not want us to go up Loch Fyne.

53,560. Do you want to go up ?—It does not matter much, but I might be compelled to go if I could get nothing here. In such a case as that we might like to go up.

53,561. Would it be serious hindrance to your industry as fishermen if you were prohibited from going up Loch Fyne as a trawler, and were permitted to trawl in the wider waters ?—That would depend on an early season. If we realized a certain sum of money and made good wages by it we should not notice it ; but I don't think there would be any injury in allowing us to go up Loch Fyne, because I think both systems of fishing may be allowed to go on easily.

53,562. Could your mode of fishing and the drift-net fishing go on together if you were allowed to fish in the middle of them ?—We do not require to fish in the middle of their drift-nets.

53,563. Did you not sometimes make your circles in the middle of their trains of drift-nets ?—I never saw it done.

53,564. Have you never seen trawl fishermen fishing among the trains of drift-nets ?—I have never done so. It would be to our disadvantage to do so.

53,565. (*Mr. Lefevre.*) It would be to your own disadvantage ?—Yes; we should get entangled with them and get nothing.

53,566. (*Mr. Caird.*) If you were excluded by law from doing so it would be no hardship upon you ?—No.

53,567. That would be a reasonable thing to do ?—Yes ; because it is for our own advantage to keep clear of the drift-nets It is impossible that you can drag the trawl right over the drift-nets, and in such a case we should get nothing at all.

53,568. You agree with the previous witnesses, that going out to trawl in deep water would be an exceptional thing ?—Yes ; it is for our advantage to keep near the shore, and when we can get herrings there we always capture more than we could get by going out into the Channel.

53,569. Have you found in coming to market with trawl-net fish that you can get as good a price for them as the drift-net fishermen can for theirs ?—Yes. I have seen trawled herrings get a great deal more. I have known trawled herrings realize 1*l.* 7*s.* 6*d.* when the drift-net herrings have only been realizing from 5*s.* to 8*s.*

53,570. Was that because you got a fine quality of herring upon that occasion ?—Yes.

53,571. That was an exceptional thing?—No, it was the general rule ; we regularly realized 25*s.*, 26*s.*, and 27*s.*

53,572. But taking the average of the whole season, and not when you were catching very fine large fish, was it the case that you could realize as good a price from the fish buyers as the drift-net fishermen ?—We always realized more, that is the reason the drift-net fishermen were against us ; they would go to sleep at the head of their trains of nets, and command a great price for the few hundreds of herrings they got. At present they are enabled to get a good price for the few fish they come in with, but if they found the market glutted with fine trawled herrings, then the price of their fish would be materially reduced. That is the real cause of the feeling they have against the trawlers.

53,573. Is it not correct to say that the trawl-net herrings bring a lower price than drift-net herrings ? —They never did.

53,574. You are referring now to the fresh market ? —Yes.

53,575. But for the purpose of curing would there be a distinction ?—I have seen the chief curers in Glasgow, and the agents from Leith, purchasing and buying our fish at 6*s.* and 7*s.* a 100 where they would not give 5*s.* for drift-net herrings for curing.

53,576. Then the drift herrings do not as a rule bring a larger price than trawled fish ?—No.

53,577. Would not the buyers ask you the question whether they were trawled or drift-net herrings ?—No, because they would know they were trawled herrings ; they know the distinction between the two. We have only a small boat with four men ; in fact they would see the net and know the mode in which we had caught them.

53,578. Knowing the fact that they were trawled fish they did not say that they were not worth as much as drift-net fish ?—No.

53,579. They bought the one as readily as the other? —Yes, and more so.

53,580. (*Mr. Lefevre.*) Did the drift-net fishermen and the trawl fishermen sell to different curers ?—No, they generally sold the fish to the same parties.

53,581. When the Inverary fishermen are fishing down here do they bring the fish in here for sale ?—Yes.

53,582. Do the curers come down here ?—Yes, sometimes ; but if the fishermen can get a better price at the quay they sell them there ; they often get a better price from the fresh buyers than from the curers.

TARBERT.

J. Maclean.

24 Sept. 1864.

53,583. Have you known cases in which the curers refused to buy from the trawlers ?—No, but I have known persons in Glasgow who have been giving evidence against trawling to be sending down their vessels clandestinely in order to obtain trawled fish; and yet they have been petitioning against trawling.

53,584. Have you known the boats of the curers lying here refusing to buy trawled fish?—Not when the trawling was legal; that never happened to my knowledge; they never refused to purchase trawled herrings until it was rendered illegal to trawl.

53,585. Up to what year, because it has been illegal since 1851, although it was not enforced ?—I mean until 1861; unless they were caught in the act the herrings were not seizable.

53,586. Have you been fishing this year ?—No, I have not.

53,587. Has the take of the Tarbert men been very bad ?—Yes, it has been very bad this year, they have had little or nothing at all; in fact they are almost in a state of poverty compared with the position in which they used to be.

53,588. Where has the fishing been mostly ?—Chiefly about the mouth of the harbour, and on the east shore.

53,589. Where would trawling take place if it was allowed ?—Much about the same ground; but now, unless the herrings are compelled to go into the train of nets, they will not go of their own accord. The fishermen have small pieces of net to compel them to mesh in it.

53,590. When the herrings were in abundance in the upper part of Loch Fyne and the Kyles of Bute did the trawlers go there ?—Yes, I have myself trawled both in Loch Fyne and the Kyles of Bute.

53,591. Did the great body of the trawlers go up there ?—One year they did in particular.

53,592. Was it confined to one year ?—Yes.

53,593. What year was that ?—It was in August 1859 or 1860.

53,594. Why did they not go in previous years ?—They had no occasion to go up, the herrings were always frequenting their own coast; but the one year I mention in particular they all went up. There was a larger quantity of herrings in the loch and the Kyles of Bute and there was nothing to be got thereabouts, and we therefore went to trawl up Loch Fyne.

53,595. Did any confusion take place in Loch Fyne in consequence ?—No, there was a small squabble that happened at Inverary Quay, but they were the agressors.

53,596. Who ?—The Inverary people. I was an eye witness, and they chased a person down the quay with a hay fork.

53,597. Was the whole fleet of drift-boats fishing in Loch Fyne at the same time ?—Yes, from all parts and from the Kyles of Bute.

53,598. How many boats ?—800 or 900.

53,599. How many would be trawl-boats ?—60 or 70.

53,600. Do you think the two kinds of fishing can be carried on in such narrow water as that without confusion ?—Yes, they could easily carry on both kinds between them.

53,601. Have you ever known full fish taken here in August or September ?—I have seen full herrings in August.

53,602. Is it some time since you have seen them ?—They do not often get full fish in August now.

53,603. Used they to get them in great abundance?—They are not as abundant as they used to be. In some seasons we used to have immense quantities of them.

53,604. Have they diminished of late years ?—I do not think they are the same shoals of herrings that frequent the loch as they were formerly.

53,605–9. Were they large herrings formerly ?—Yes, they would run from 800 to 900 to the barrel.

53,610. Did you catch other fish in the trawl besides the herring; did you catch any haddocks or any other description of fish ?—No, I never saw haddocks or any other description of fish in the trawl-net, in fact I never trawled for them.

53,611. Did any of the other fishermen ever trawl for other fish except herrings ?—Yes, mackerel.

53,612. Has that been put a stop to ?—Yes.

53,613. What time do the mackerel come here ?—At present this is the season for it.

53,614. Have there been any number of mackerel in the loch of late years ?—Yes, there have been great shoals but we have not been allowed to catch them.

53,615. How is that ?—The mackerel themselves are not seizable but the trawl is. We are not allowed to use the trawl, and there is no other mode of catching them but by the trawl.

53,616–7. Did that form a large proportion of the catch of the fishermen here ?—Yes, we realized a good income from the catch of mackerel some years.

53,618. There was no take of any other kind of fish?—We had here a sort of fish which they call saithe.

53,619. They are coal-fish, are they not ?—Yes.

53,620. Did you fish regularly for coal-fish ?—No, we caught them accidentally among the shoal of herrings.

53,621. Have you ever seen the fishermen take large quantities of the small fry of other fish, such as haddock or cod ?—No, I never saw any small fry in the herring-nets, except it was small herring fry that were properly fished for bait.

53,622. Are they fished for with a smaller net ?—Yes.

53,623. What was the size of the mesh of that net?—The mesh would run about 50 rows to the yard.

53,624. (*Mr. Caird.*) Have you ever had any of those large hauls which have been mentioned in which vast quantities of herrings have been left to rot in the sea ?—No; and I believe I have got about the largest haul of herrings that was ever made here. I brought at one time 1,500 maze of herrings to the market.

53,625. Were they caught in one haul ?—Yes.

53,626. Fifteen hundred maze ?—Yes.

53,627. When was that ?—That was in 1859.

53,628. How many boatloads were there ?—There were 12 large smacks besides our own small one.

53,629. You caught all that immense quantity of fish in one haul ?—Yes.

53,630. What was the length of your net ?—About 60 fathoms.

53,631. How long did it take you to get the fish in?—We were working for about five or six hours until the "Jackal" came and scared us away. We had to leave with our trawl as trawling was illegal at that time.

53,632. But you got 1,500 maze before the "Jackal" came ?—Yes, and we could have got as much more if we had not been scared away.

53,633. Then if there was any lost on that occasion it was no fault of your own ?—No.

53,634–5. Nor from any incapacity to get them in ?—We had lots of vessels to take the herrings from us and they were all ready when the "Jackal" hove in sight, and we had to leave them.

53,636. Can you tell us what you realized by the fish ?—I forget the sum of money. I was not present when the whole of them were sold. I had to go away.

53,637. Were they sold fresh ?—All of them were sold fresh.

53,638. Were none of them cured ?—I think not.

The witness withdrew.

DUNCAN MACDONALD called and examined.

53,639. (*Mr. Caird.*) You were present, I believe, when the large haul spoken of by the last witness was secured?—Yes.

53,640. Are you able to say what proportion of that large haul was cured?—Yes, about 200 maze.

53,641. How many barrels would that be?—About 100 barrels.

53,642. Do you know whether they were successful as cured herrings; did they keep well?—Yes, I think they did.

53,643. Who cured them?—Mr. Gallagher cured them.

53,644. How were they sold?—They realized a good price; they sold for 2*s.* 2*d.* and 2*s.* 6*d.*

The witness withdrew.

JOHN MACLEAN recalled and examined.

53,645. (*Mr. Caird.*) Were they not knocked about?—No, they were remarkably good.

53,646. You say that some were lost on account of the interruption of the "Jackal"?—Yes.

53,647. On any other occasion have you had a large haul which you have been unable to use or to bring to land?—No, unless it was in consequence of the interruption of the "Jackal." We then felt ourselves compelled to escape from the rigour of the law.

53,648. Then if it is alleged that great quantities were often lost when you had these large hauls, from its being impossible to bring them to land, you would not admit that to be true?—No.

53,649. It has not occurred within your knowledge?—It has not occurred within my knowledge, and I believe it never did occur; that statement is quite wrong altogether. It is for our advantage to bring the fish to land, and the more we get the more money we realize.

53,650. Have the fishermen here generally been able to supply themselves with drift-nets since trawling has been put a stop to?—Some of them have and others have not.

53,651. Have you ever heard it stated that the Inverary men made an offer to provide you with nets if you would accept them?—I don't suppose the fishermen here would accept them if they did; they would rather starve than that.

53,652. But has that offer ever been made?—If they made it they never made it public in this quarter.

53,653. (*Mr. Lefevre.*) How many hauls could you make with the trawl in the night-time?—Do you mean how many sweeps?

53,654. Yes?—Perhaps we should only require to make one.

53,655. What would be the average number?—It would depend upon the quantity of fish we were getting.

53,656. Would you often make eight or 10 hauls?—Yes.

53,657-9. Catching fish each time?—Yes, but one trawl at one time is quite sufficient to get a large quantity of fish.

53,660. (*Mr. Caird.*) In what depth of water and at what distance from the shore did you catch that large haul to which reference has been made?—The depth of water would be from 15 feet down to 2 feet.

53,661. Then it was close in-shore?—Yes, quite on the sand on the beach.

53,662. Was the net hauled on shore?—No.

53,663. Was it dragged into the boat?—Yes, it was dragged alongside the boat.

53,664. And the boats were filled from it?—Yes; it went very steep where the boats were moored outside.

53,665. In the course of the six hours which were occupied in securing the quantity which you did get time to secure was there a large quantity dead by the time you had finished?—We had several large smacks full before they were all dead.

53,666. Were they alive as you lifted them from the water?—They were dead at the hinder end; there were such a bulk of them on the top of each other.

53,667. How long were you engaged in filling the boats?—About six hours from the time we hauled the net until we were interrupted by the "Jackal."

53,668. (*Mr. Lefevre.*) Have you often caught as many as from 100 to 200 maze in a night?—Repeatedly.

53,669. Would that be a fair average?—It is common to take from 80 to 100 or 120 and from that to 150, 200, and 250.

53,670. (*Mr. Caird.*) Which would make most money in the course of a season the trawlers or the drift-net fishermen?—The trawlers, decidedly.

53,671. What would you consider the average rate of earnings for trawl-net fishermen during the seven months of the season?—They would realize from 80*l.* to 120*l.* in the course of the season.

53,672. Each man?—Yes.

53,673. Not a boat's crew?—No.

53,674. But each man?—Yes.

53,675. From 80*l.* to 120*l.*?—Yes.

53,676. Is it not usual for two boats' crews to fish together?—Yes.

53,677. Eight or nine men?—Eight men.

53,678. Eight men in the two boats?—Yes.

53,679. What would be the average earnings per man in the same season for the drift-net fishermen?—If the drift-net man could realize 40*l.* during the same season he would be a very fortunate man.

53,680. Then the trawlers would get nearly three times as much?—They would in general, and their expenses would be much less.

53,681. Can they make three times the amount of money at less cost of capital and labour?—Yes.

53,682. Were you yourself fishing in 1862?—Yes.

53,683. Do you know what you made that year?—I have a good idea of it.

53,684. How much was it?—The average that year would be about 55*l.* and from that up to 60*l.*

53,685. How do you account for the fact that the Inverary men have never taken to trawling?—My opinion is that they are too lazy to take to it.

53,686. Do you not think the great profit which, as you have described, they would make would be a considerable inducement to them to take to trawling?—They cannot work at it. They know nothing about it.

53,687. (*Mr. Lefevre.*) Was there much trawling from other villages, such as Ardrishaig and other places?—Yes, from Campbeltown, Ardrishaig, and Carradale.

53,688. How many have you seen trawling?—20 or 30 strange boats.

53,689. Were they from Ardrishaig?—No, I don't refer to the Ardrishaig boats or those from Tarbert.

53,690. You exclude those two places?—Yes.

53,691. You have seen 20 or 30 boats excluding the boats of Ardrishaig and Tarbert?—Yes.

53,692. (*Mr. Caird.*) Are the fishermen here, as a rule, strictly fishermen, or have they any other occupation?—They have no other occupation, they are strictly fishermen.

53,693. Is there a distinction between them and those of the upper part of the loch in that respect?—Yes, because they are not fishermen at all in the upper part of the loch.

53,694. They do not follow fishing the whole year round?—No.

53,695. Only during the herring-fishing?—Yes.

53,696. But you do follow fishing the whole year?—Yes.

53,697. Even when the season for herrings is not on?—Yes.

TARBERT.

J. Maclean.

24 Sept. 1864.

53,698. What do you do in the close-season?—In the close-season we generally take to long-lines and small lines, but as they cannot support all of our fishermen the youngsters and able-bodied young men take to the sea and go away.

53,699. (*Mr. Lefevre.*) Was there ever much trawling here in January?—Yes, in fact the best of the takes have been captured in January.

53,700. Later than that?—Yes, in February.

53,701. Have you known many fish to be taken in March, April, and May?—I have seen good takes in March, but very little in April or May.

53,702. Did you generally set your trawls inside in those months?—Yes.

53,703. Are the Tarbert men as well provided with drift-nets as the Inverary men?—Some of them, but they have only small pieces of net.

53,704. Are their nets as deep?—Yes, they are equally deep, but they are not of the same length.

53,705. What is the depth?—About six or seven fathoms.

53,706. I mean drift-nets?—Yes.

53,707. They are no more than that?—No.

53,708. Was there much variation in the size of the trawl-nets?—Yes, some of them will draw as high as nine fathoms.

53,709. Nine fathoms deep?—Yes.

53,710. What are they in length?—About 60, 70, and 80 fathoms.

53,711. (*Mr. Caird.*) Have the fishermen here small crofts or farms as a rule?—There may be one in a hundred who has.

53,712. How is it in the upper part of the loch?—The larger number of them have small crofts.

The witness withdrew.

A. Brown.

ANGUS BROWN called and examined.

53,713. (*Mr. Caird.*) Can you give us any information as to whether when the drift-nets have been set and have not been catching fish you have been able to catch large quantities of herring by hauling hooks up through the shoals?—I have set the drift-nets among the fish and there have been very thick shoals and I have not been able to catch more than three of them in the meshes, whereas we could catch on the hooks 600 herrings.

53,714. How do you do it; in what manner do you catch them?—We fix a hand line with a sinker upon it about a pound weight, and a wire about 15 inches in length to it with a hook attached to each end of the wire. We have about eight hooks on the line, and putting it down among the fish we can take up eight herrings at every haul. We let it down in from four to 10 or 15 fathoms of water.

53,715. Did it go down among the shoal of fish?—Yes.

53,716. And you pulled the fish up?—Yes.

53,717. They do not catch by the mouth as if they were taking bait?—A great many of them were caught by the mouth.

53,718. But not as if they were regularly fished with a baited hook?—They would be caught by the hook.

53,719. But the hook had not bait upon it?—Not a single particle of bait; it was only a white bare hook.

53,720. Did they take the hook because it was very bright?—Yes.

53,721. Did the hook take them?—They took the hook because it was bright; they mistook the hook for small fry.

53,722. If you were allowed to trawl could you have caught plenty at that time when you were not catching them in your drift-nets?—Yes, we could have caught thousands of pounds worth, but trawling was prohibited.

53,723. Was that the first time you thought of that plan of catching them by the line?—We have caught herrings with the line in that way for the last 20 years.

53,724. In the same manner?—Yes.

53,725. When you have found great shoals of them?—Yes; they come in about the 20th of May in general and continue for two or three months until July.

The witness withdrew.

D. Macmillan.

DUNCAN MACMILLAN called and examined.

53,726. (*Mr. Caird.*) You were a trawl fisherman here when the fishermen were permitted to use that mode of fishing?—Yes.

53,727. Do you think it has been a great loss to the place that that system has been put a stop to?—It has been a great loss to the country.

53,728. You have heard what the previous witnesses have stated on the whole subject?—Yes.

53,729. Is there any point which you think has not been fully stated?—I think they have given full evidence and that what they have stated is quite correct. We catch different species of fish besides herring. We catch mackerel and whiting also.

53,730. With the trawl-net?—Yes.

53,731. What do you catch with the trawl?—Mackerel, saithe, and whiting.

53,732. As well as herring?—Yes.

53,733. Do you catch them along with the herring?—Not very often along with the herring.

53,734. Do you fish specially for those fish as well as for the herring?—Yes, we did for mackerel; they do not swim among the herring.

53,735. Were they caught at the same time the fishing for the herring was going on?—Yes.

53,736. When you saw a shoal of mackerel would you take to them in preference to the herring?—In general we did.

53,737. Was there any large quantity of mackerel caught in that manner in August?—Yes, a great quantity, and we were getting a good price for them.

53,738. Has that fishing been stopped in consequence of the prohibition of trawling?—Yes, decidedly.

53,739. Have any mackerel been caught here since?—Very few since we gave up trawling.

53,740. Have mackerel been seen in the loch?—Yes, they have been very plentiful in the loch.

53,741. If you were permitted you could have supplied the market with mackerel?—We used a small cuddie-net last year and we got 40*l.* worth of mackerel in one night.

53,742. Was that a legal net?—It was quite legal; the size of the net was large.

53,743. Was it not wrought like a trawl-net?—Yes, and fishing in that way was illegal.

53,744. Having caught the mackerel by that mode of fishing, as it was not legally caught, did you take the mackerel you caught to the market and sell them?—Yes.

53,745. But if you had been seen using that net for the purpose of catching mackerel you would have been stopped?—Yes, and we should have been sent to Campbeltown or Inverary Gaol.

53,746. You think large quantities of mackerel could be caught in that way if you had permission to use the net?—Yes, without doubt.

53,747. Is that the only mode of catching them?—There is no other mode of catching them.

53,748. (*Mr. Lefevre.*) Cannot you catch them with the drift-net?—No, we might get one or two or a dozen, but we could not send them to the market. We

TARBERT.

D. Macmillan.

24 Sept. 1864.

could not get as many as would be worth while to take to the market.

53,749. (*Mr. Caird.*) You are more successful in catching mackerel with the trawl than with the drift-net?—They will not mesh in the drift-net; they are like the large herrings we used to get in the trawl.

53,750. What other fish besides mackerel have you been in the habit of catching?—At different times years ago we have got a good take of whiting on this shore.

53,751. With the trawl?—Yes, and saithe.

53,752. Was that during the time the herring-fishing was going on?—It was at the latter end of the fishing. December is the best month.

53,753. You are unable to catch them now?—Yes, we are unable to keep up our trawl-nets. Perhaps there may be one or two about, but they are out of order now. We are prevented from taking those fish as well as the herrings.

53,754. The stopping of trawling has been injurious to the supply of other fish as well as herrings?—Yes, but trawling for herrings was the only way of living we had. In my opinion trawling is the best mode of catching them. We could have supplied the market both this year and last year with a large quantity of herrings if we had been allowed to trawl. The supply would have been double what it has been with the drift-net fishing.

53,755. Is there any other point you would like to remark upon?—The witnesses you have already heard have given a good deal of facts that are quite correct. I do not know that there is anything else I have to add.

53,756. Are there any oysters caught in this neighbourhood?—We have caught them, but not with the trawl-nets.

53,757. Are there any lobsters?—Not many; we do not make a living by that; it was the herrings that we fished. I think they have as much right to fish at Ballantrae as in the loch. There is no necessity at all for a close-time. Every fisherman requires to work every day in the year if he can.

53,758. Would not a close-time be beneficial to the fish themselves?—There is such a body of fish that it is not required. It is not the fishermen who keep the fish down; the vermin who prey upon them do a great deal more in that way than the fishermen.

53,759. (*Mr. Lefevre.*) Have you fished on the Ballantrae banks yourself?—No, but I have seen the people come round here and they have been quite destitute since they have been prevented from fishing. They would get 3*s.* 6*d.* a hundred for the fish they caught. I think they have as much right to fish when Providence sends the fish to their very doors as the people of Loch Fyne.

53,760. Was there much fishing for herrings during what is now the close-time?—Yes, we were getting a great quantity of fish. We were catching fish in March for which we could get 4*s.* 6*d.* a hundred from vessels going to Liverpool.

53,761. For herrings?—Yes, and often our own market consumed a great deal.

53,762. Were they caught mainly with trawl-nets?—Yes, but they used to shoot drift-nets for them if they could get any at all. They could make a living out of them.

53,763. How many trawl-nets were at work here in what is now the close-season?—There were 80 boats working here with trawl-nets.

53,764. Not working here the whole year round?—Yes, they were.

53,765. Even in March and April?—Yes.

53,766. Were the fish they took in those months spent fish?—No person can take unwholesome fish out of the sea. All we get take the market very well.

53,767. Were they spent fish?—Yes, in the month of March they are spent.

53,768. Did you take the fish up with the spawn coming from them?—I never saw spawn.

53,769. Do you ever take fish full of spawn in February or March, or ready to spawn?—No; at one time we got them in the month of December and we got 5*s.* a hundred for them.

53,770. Were they full fish?—Yes, good large herrings. We think they come from Loch Fyne, but it is not properly known where they come from.

53,771. You think there is no necessity for a close-time?—No, there is no necessity for it. We fishermen think we have as much right to fish in the winter season as we have to fish in the summer season.

53,772. But you think that in this place there is no necessity for a close-time?—There is no necessity for a close-time at all. The market requires a fresh stock of fish every day.

53,773. Have you ever had any sprat-fishing in this loch?—No; if they kept their trawl-nets with the meshes an inch from knot to knot it would be impossible to catch small herrings.

53,774. Have you ever tried for mackerel with drift-nets of a larger mesh than you use for herrings?—No, that would not pay.

53,775-6. Are mackerel not here in sufficient quantities to make it pay?—It would not pay for us to keep mackerel-nets.

The witness withdrew.

COLIN G. CAMPBELL, Esq., called and examined.

C. G. Campbell.

53,777. (*Mr. Caird.*) You have had occasion, Mr. Campbell, to make a trial of the quality of the trawled herrings when cured?—Yes.

53,778. Can you give us any statement as to the result of that trial?—I got a cask of trawled herrings taken here by a man named Colin Campbell in this village and I had them cured to be sent to Brussels. That was either in 1858 or 1859, at the end of October or the beginning of November, and I can state that those herrings were still good 18 months afterwards.

53,779. Had you any opportunity of comparing them with cured herrings caught by the drift-net in the same season?—I got no others out the same year. I merely tried them to see if they kept well. It was a longer time than I ever saw any others kept.

53,780. Were they of good quality all the time?—Yes.

53,781. Then you have proved by that experiment that it is perfectly practicable to cure and keep trawled herrings?—Yes; that experiment showed me that they were perfectly good at the end of 18 months. I may also mention another fact. I am aware that great prejudice exists against trawling on the part of a number of the most influential people of the country from an idea that the salmon-fishing is injured by it. Now I have used the seine-net, which is a trawl-net, for catching salmon and sea trout in the West Loch for many years and I know that it is almost impossible to do it in Loch Fyne except in a few spots. If you raise the rope in the least degree to lift the net over a stone the fish escape and you cannot take them in any number.

53,782. Either salmon or salmon-trout?—Yes.

53,783. You are aware that the trawl fishermen when fishing with the trawl did not catch salmon or salmon-trout?—I have made inquiry into that matter and I believe they did not.

53,784. There was no destruction of salmon or salmon fry by that means of fishing?—None whatever.

53,785. Can you tell us anything as to the condition of the fishermen here, whether it has been seriously prejudiced by the prohibition of trawl-net fishing?—It has made all the difference to them between affluence and extreme poverty; I know several men who were formerly engaged in the fishing who have left it altogether, and are now engaged as able seamen in the traffic between this country and America; they have left the fishing business whenever they could. I received a return from the chief of the police, showing that 60 men had been condemned to a considerable length of imprisonment for infringing the law, when it was

TARBERT.

C. G. Campbell.

24 Sept. 1864.

suddenly re-enforced after the fishermen had been permitted by the Board of Fishery to practise trawling. 60 men were condemned who had been actually forced by starvation into using illegal nets.

53,786. In consequence of the destitution of their circumstances?—Yes, they had no other means of support, and to a great extent their property was suddenly seized and confiscated.

53,787. During the last two years there has practically been no infringement of the law, but the people have submitted?—Yes, for the last two years or so; trawling is now nearly entirely given up.

53,788. (*Mr. Lefevre.*) Did not the successful season of 1862 better the condition of the men?—No, they were not nearly as well off as usual; I cannot state to what extent they were benefited that year because I was not in the country then.

The witness withdrew.

W. Campbell, Esq.

WILLIAM CAMPBELL, Esq., called and examined.

53,789-90. (*Mr. Lefevre.*) You put in a statement in reference to the trawling question to the Commissioners of 1862; have you anything to add to that statement?—I have very little to add to it; I think I can abide in every respect by that statement.

53,791. (*Mr. Caird.*) Are you in favour of a close-time being established?—Yes, because I think it is generally desired, and although upon abstract principles I think that a close-time is not necessary, still I think as there is such a general feeling in its favour it is not desirable to oppose it.

53,792. Are we to understand from you that you represent the general feeling of the fishermen of this part of the loch, when you say you are desirous that there should be a certain amount of close-time?—At the time I made that statement such was their desire, but it arose more from a conciliatory principle than from any acknowledgment of its necessity; they seem now rather to think that there is no necessity for a close-time at all, but I was not aware that such a feeling had grown up as much as it appears to have done.

53,793. There is a general feeling we find in favour of opening the month of January, but we have found at other parts of Loch Fyne that the feeling is against opening the months of February, March, and April?—Such is precisely the view I take of it.

53,794. Is that view pretty much shared by the fishermen in this quarter?—I think they would be pretty much satisfied with such an arrangement.

53,795. (*Mr. Lefevre.*) Is the condition of the fishermen here generally as bad as it was immediately after putting a stop to trawling?—I am not sure that it is quite as bad but I think it is not at all the satisfactory position it would be if they were permitted to trawl during the season. You have had laid before you I think very conclusive evidence that trawling is a much more profitable and much less expensive mode of capturing fish.

53,796. Did not the fishermen here share in the prosperity of the fishing season of 1862?—I think they did, but not to the same extent; not having the means of purchasing large drift-nets and boats to correspond they were obliged to work with their own inferior machines.

53,797. Are they still imperfectly provided with drift-nets and boats?—I think they are. The expense of drift-nets along with the boats and everything else is much greater than that of a trawl-boat and nets.

53,798. (*Mr. Caird.*) Would it be quite possible without any serious danger of collision to permit the two kinds of fishing to be carried on in the lower waters of Loch Fyne?—I believe so, but I have no practical knowledge of the fishing. I merely give now an opinion founded upon a pretty extensive inquiry into the subject.

53,799. As a resident magistrate do you think there would be any difficulty in keeping the peace among the different classes of fishermen?—That I can answer very decidedly as a resident magistrate. I do not think there would be the slightest difficulty.

53,800. (*Mr. Lefevre.*) Was it your observation that the men employed in trawling were as a rule younger and more active men than those engaged in drift-net fishing, or was it otherwise?—I think they were decidedly. I think it requires a good deal of strength and energy to engage in trawling. It is not a matter for which an old man is able and competent. It requires a great deal of pulling. They have to pull a heavy boat, and when they sweep their nets it is very hard work, much harder than that which attends drift-net fishing, where after shooting their nets they frequently go to sleep.

53,801. Could the trawlers work their nets when the drift-net fishermen cannot go out in consequence of bad weather?—I am not able to speak to that.

The witness withdrew.

J. McLean.

JOHN MCLEAN recalled and examined.

53,802. (*Mr. Lefevre*). Have you ever observed that the trawlers could work their nets when the drift-net fishermen cannot go out?—Yes, often when the drift-net fishing could not go on.

53,803. Was that frequently the case?—Yes; we have often pulled our small boats out in a heavy sea. I have seen very large takes of herring got in a stormy night when none of the drift-net fishermen would venture out.

53,804. Your boats are not larger than theirs but smaller?—They are a great deal smaller; they are not one-tenth part as large as some of the drift-boats.

The witness withdrew.

B. Hardy.

BERNARD HARDY called and examined.

53,805. (*Mr. Caird.*) You are a buyer of fresh fish?—Yes, and have been so for 40 years.

53,806. At Tarbert?—Yes, and up and down the loch between Campbeltown and Inverary.

53,807. Are you a buyer just now?—Yes.

53,808. Do you get nothing but drift-net fish at present?—Nothing but drift-net fish.

53,809. When you were able to purchase trawl-net fish did you find them as good for the fresh market as the drift-net fish?—I was 12 or 14 years buying herrings before the trawled fish came in. I believe I got the second shot of trawled fish that was ever fished in this country, and those herrings were about 400 to the barrel; that would be about the count of them. I got about 100 maze, and I had never seen, previous to trawling coming in, such herrings as they were, I have occasionally purchased similar herrings since. Sometimes I would buy the trawl-caught herrings and sometimes herrings caught in the drift-net on the same day. For 20 years of my time I was the principal fish buyer sending fish to the Glasgow market; but I never put money into drift-net fish of such a quality as the fish I have purchased from the trawlers.

53,810. Trawled herrings?—Yes.

53,811. Have you not observed that the scales of the trawled fish were sometimes injured?—So little have I remarked that, that when I have seen the trawled and drift-net herrings together I have put marks inside the lids of the baskets that the different kinds of fish might be known when they opened the basket. They would sometimes bother themselves to

find out which was which when they had them sent in, there was so little difference.

53,812. Could they not tell which was which ?—No, unless they put their hands down among them and then they would know them by the difference in the size.

53,813. The trawled herrings were generally the largest ?—Yes.

53,814. On the average of the whole season, were you as a buyer ready to give quite as good a price for the trawl-caught fish as you were for those caught in the drift-nets ?—When I looked in a trawl-boat and saw there were fish there of a good size, I would take the trawled herrings and put my money into them as freely as I would into the drift-net herrings because I got a market for them quite as good, and my opinion was that the fish were as good.

53,815. As a buyer you have not made any distinction of price against the trawled fish as compared with the drift-net fish ?—No, I am beholden to both kinds of fishers, to the drift-net fishermen as well as to the trawlers when they were allowed to trawl. They are all drift-net fishermen just now, but still as a body of people they are quite separate. There are two separate bodies, one wanting trawling to be allowed again, and the other wishing to maintain the prohibition which now exists. I have been indebted to both of them, and I therefore refrain from having anything to do with their disagreements ; but I still consider that the prohibition of trawling was unfair, unreasonable, and unjust.

TARBERT.

B. Hardy.

24 Sept. 1864.

53,816. That is not the question ; we are asking you as to a fact, do you consider that the fish caught in the trawl-nets, on the average of the whole season, were quite as good in quality as the fish caught in the drift-nets ?—Yes.

53,817. Do you mean also to say that there is nothing in that mode of capture or the way in which they are put into the boat that injures them for the market ?—I never supposed that there was. If the mesh of the net is of the same size as the regular stated size I am of opinion that the trawl-caught fish are quite as good as those caught in the drift-nets.

53,818. (*Mr. Lefevre.*) But only in the case of the nets being of the legal size ?—It is against the law to put down a small mesh ; a smaller mesh than one inch. That has always been the size long before the trawling began ; therefore those who fish with a small mesh would be breaking the law. If they fished with a drift-net having a mesh less than that size that would be quite as unlawful as fishing with a trawl-net with less than the legal mesh.

53,819. You are aware that the trawlers did fish with a net less than that size ?—Yes ; they made a bag in the net and in that bag there were small meshes which shut in the small fish.

53,820. Then you allow that there were a certain number of small fish caught ?—Yes, there were.

The witness withdrew, and the inquiry was adjourned until the 26th of September, at Ballantrae.

Ballantrae, Ayrshire, Monday, 26th September 1864.

PRESENT :

JAMES CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

BALLANTRAE.

W. Coulter.

26 Sept. 1864.

WILLIAM COULTER called and examined.

I have been a fisherman here for 40 years. There are 50 fishermen here, and 12 boats of about 21 feet on the keel. They are fishing all the year round. The fishing for the spawning herring began about 25 years ago. I fished many years before it began. We could not catch the herrings with the ordinary drift-net because the fish were deep in the water on the ground spawning. The water on the banks is from 10 to 15 fathoms deep. The nets were 75 meshes deep, and 32 meshes to the yard ; they were of all lengths divided as we liked, and were sunk to the bottom by heavy stones. The nets were often covered with spawn, as were the stones attached to them. This was fresh spawn just shed, and not what had been adhering to the bottom. I think the proportion of roe and milt herrings was nearly half and half. I have seen a boat take as much as 45 maze in one night. After prosecuting the fishing for some time we fished all day and all night, and took up the nets several times.

I have seen 22 boats belonging to Ballantrae engaged in the fishing, but there were about 100 boats fishing in this way at once. The banks are about three miles long. Some boats cleared 80*l.* to 100*l.* in the few weeks fishing, which lasted eight to ten years.

The fishing ceased altogether in 1856. I produce my books for the years 1848 to 1856 inclusive ; from which it appears that I made in

		£	s.	d.

1853.	Owing to bad weather the fishing took place only on the 2d, 3d, and 7th March, nevertheless it yielded - - - - -	35	10	0
1854.	February 14th to March - -	35	8	0
1855.	February 24th, only (1,200 fish obtained) - - - -	3	6	0
1856.	Nil.			

After this we tried no more fishing, and the gannets never told us that the fish were there. I have lost my earlier books ; but am sure that from 1830 to 1848 the fishing was quite as good, for in one of those years my boat made 115*l.* The first year that there was close-time the herrings came back at the usual time, that is, in February 1862. In that winter we had quantities of cod. When porpoises appear there are always cod. Cod and herrings are always abundant together. If herrings are not there neither will there be any cod. We always blamed trawling for the fish not coming to these banks, as the trawling was carried on all along the shore from the Kyles to Girvan. About from 1841 to 1843 I myself trawled, but I used the legal mesh. We fished with one boat, and four men anchoring one end of the net ; this trawling was at Troon, Ayr, and Irvine. It was in the month of December, and we continued it for eight or nine years. Others trawled after that, but none of us went from here. The fish were then coming to the banks. Herring are not here all the year round. We considered that the herring came from the Kyles. Eight or nine boats went from this to Troon to trawl, and there might have been 30 boats altogether. The fishing was very uncertain ; but when we did get a haul by the trawl it was a big one. At that time, and during the time in which I was engaged, no one interfered with us.

We caught very fine fish, the best ever caught here, what they call Yarmouth bloaters. At other times I have seen numbers taken three inches long with a net having meshes 50 squares to the yard. It is impossible to get any number of these small fish with the legal mesh net. I think when the fish are numerous in the trawl they lose the scales and are what we call drowned fish. Trawling breaks the eye of the fish for the time, but I cannot tell when they unite again. Porpoises frighten the fish into a mass and go round them like a shepherd's dog. I think trawling injures the fishing when small fish are taken, and that it

BALLANTRAE.

W. Coulter.

26 Sept. 1864.

always does injury by breaking the eye of the fish, even when the legal mesh is used. I have sometimes caught fish with the trawl many nights running in the same bay, there was always another eye coming up. I do not think this is against my opinion, because I fancy the shoals were always new ones.

The Ballantrae banks are shingley and in some places with sea weed, but the herring prefer the shingle for spawning. The fish come to the banks to spawn in autumn as well as in spring. The largest take I ever saw was 42 years ago. There has been no summer fishing here for 10 or 14 years till two years ago. In January the fishermen suffer for want of bait for a month or five weeks ; herring being then wanted for the cod, which will not look at a buckie when they are after the herring. I think it would answer for a boat to be licensed to catch herring for bait ; but it is so open a coast that one boat would hardly catch enough in winter. I would let each boat catch bait for itself, giving caution only to catch for bait and not to sell. I have known 22 boats here, there are now only 12.

I used to trawl off Troon in December with a view to catching the herring on their way from Loch Fyne, the Kyles, to their spawning beds off Ballantrae. There were a great many trawls used there. The Tarbert men used to come down there. I think that the trawlers headed the shoals of fish on their way to the banks, and so having banished the herrings there were no turbot nor cod on the banks. I hope that trawling for herring in this way will not be permitted. The net-fishing on the banks may also have done harm; when we took the herring in the daytime off the banks they were mostly full; when we took them in the night, they were already spent. We have no desire to return to that mode of fishing. There were often great losses of herring nets during the spawning season, in consequence of the rough weather ; taking that into consideration the cod and turbot fishery during that season is more profitable than the herring fishery. There is no part of the ground where the herrings spawn fit for beam-trawling. I have often taken 15 to 16 herrings from the belly of a turbot. Stenlock are caught in great abundance with the cod-nets, they are four times more numerous than the cod ; we get 6*s.* a cwt. for stenlock ; when cod are 10*s.* per cwt. There are often great numbers of dog-fish, particularly two or three years ago, when they were in great quantity in February and March on the spawning beds. They would often take the cod out of the nets and eat nets and all ; we used to get a good price for the herrings taken on the spawning grounds, often 5*s.* per hundred; they went to Manchester as Yarmouth bloaters. The Girvan and Manx boats used to buy many for bait.

A. Allan.

ANDREW ALLAN.

I am over 50 years of age, and have been a fish agent here for 35 years, and am connected with the fishery and much interested in them. At the earliest period of my recollection cod-fishing was carried on by hand-line with herring bait, five men in a boat ; about the beginning of January small quantities of herrings were taken with set-nets close in-shore, and the quantity of cod taken would range from 200 down to a few fish each day. About 40 years ago nets were introduced and large quantities of cod, ling, and skate were caught ; a few years previous to which some fishermen from Ayr commenced fishing for turbot, brill, and plaice, and being successful net-fishing became general and remunerative, in consequence new boats and greater additional material were yearly added.

About 1832 or 1833 a system of herring-fishing was introduced on the fishing bank three or four miles off shore, during March, by set-nets put down in the evening and lifted in the morning ; large quantities were caught in proportion to the materials ; latterly they began to decrease, until 1856, when they wholly disappeared, and has not since been fished. This I attribute to extensive trawling in Argyleshire and the North of Ayrshire previous to the late Herring-Fishing Amendment Act, since which herring have again appeared and of course shoals of cod, ling, skate, and turbot followed them, and the take of these fish since 1862 has largely increased.

1858	By 14 boats	- -	584 barrels.
1859	By do.	- -	330 „
1860	By 12 do.	- -	250 „
1861	By do.	- -	200 „
1862	By do.	- -	570 „
1863	By do.	- -	460 „
1864	By do.	- -	500 „

From 1858 to 1862 very few fish were caught with nets owing to the herring not having come to the banks during January and February as formerly, and those taken were by the long-line and buckie bait. During March, April, and May 1862-3-4 were successful fishings with nets, while the line-fishing was decreasing for want of buckies, which were rapidly diminishing ; and in this open coast the weather has much to do with the successful fishing in open boats. The fishing ground for nets is three to four miles off the shore, while the lines are set eight or ten miles off. The bottom of the inner bank, which may be about eight to ten miles long and from three to five miles broad, is rocks, shingle, and sand, and the chief food for the fish is the herring. The bottom of the outer bank where lines are set, is mud or clay, and the food mostly small starfish and shell-fish.

The turbot taken in January, February, and March were as follows :—

1862	By 12 boats	- -	4 tons 4 cwt.
1863	By do.	- -	1 „ 10 „
1864	Do.	- -	3 „ 15 „

Turbot taken in June and July :—

1862	By 3 boats	- -	3 „ 10 „
1863	Do.	- -	3 „ 5 „
1864	Do.	- -	3 „ 0 „

Herring taken :—

1858	From June 8 to Aug. 7	-	41 barrels.
1859	„ June 7 to July 16	-	30 „
1860	„ June 12 to June 31	-	15 „
1861	„ June 3 to July 1	-	18 „
1862	„ June 2 to August 27		100 „
1863	„ June 2 to June 30	-	58 „
1864	„ June 2 to August 13		74 „

The herrings we took for bait were found about 200 yards from low water and not on the spawning beds. Each boat ought to have liberty to fish bait for itself under penalty of a forfeiture of boat and nets or fine if proved to have sold herrings so taken.

The nets used for turbot fishing are seven inches from knot to knot, 42 inches deep, and 50 fathoms long. They are set at the bottom on soft ground in 25 fathoms of water. The fish entangle in the net and do not mesh themselves. There were a few beam-trawlers here from Whitehaven 20 years ago, but not since. The ground the herrings spawn over is rough with large stones, boulders, and gravel, and no trawl could be used over it. We used to have haddock off this coast, but they disappeared 12 years ago.

Herring-fishing should be allowed in January ; the herrings are not on the spawning beds till February. If herrings could be taken during January they would be used as bait for the cod. When they go to spawn in February nets are used for the cod, and are most effective, and then herring bait is not required. In April and May the herrings are not to be found off the coast. The buckie then takes a better quality of cod than herrings. The cod are then found from 10 to 25 miles off and we find very few herrings in them at that time ; but we find plenty of herrings in the cod when they are on the spawning beds. I have found from 30 to 35 herrings inside one codfish. When fishing for cod on these spawning beds we use nets of $3\frac{1}{4}$ inch from knot to knot, four feet deep, and 40 fathoms long. They are sunk to the bottom.

DAVID ALLAN.

There is no herring-fishing now on the spawning grounds; there is no desire to return to it, we find the cod and turbot-fishing more profitable. We desire to be allowed to fish for herrings during January; the herring is very important to us for bait during that month. During April and May the buckie is better bait than the herring, it takes a primer and better fish; the older and softer fish take the herring. We used to fish with the hand-line, but we have long given it up.

I think the trawling in December off Troon did harm as it broke the head of the shoals on their way to the spawning grounds. The trawling off Troon was from 1850 to 1860.

We could not catch more herrings in January than would be enough for bait. Our boats that go to Loch Fyne return about the new year; they would not remain there during January if the herring fishery were permitted.

(*William Richmond.*) Turbot spawn in summer, and the summer turbot are therefore caught while spawning.

(*Serj. Kelly.*) The number of boats and fishermen on the Ayrshire coast is as follows:

	Boats.	Men.
Ardrossan, Saltcoats, and Artincross	40	77
Troon and Irvine - - -	42	87
Ayr and Dumure - - -	46	82
Maiden and Girvan - -	41	69
Carlton and Ballantrae - -	32	60
Stranraer - - - -	49	104

The inquiry was adjourned until the 29th September, at Dumfries.

Dumfries, Dumfriesshire, Thursday, 29th September 1864.

PRESENT:

J. CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

JOHN PATTERSON called and examined.

53,821. (*Mr. Caird.*) You are a fish dealer at Dumfries?—Yes.

53,822. Are you well acquainted with the different kinds of fish and the mode of fishing carried on in the waters of the Solway on the coast of this county?—I have been acquainted with them for the last 10 years. When I first started the fish trade I used to get about 100 stone a day of flounders, codling, and cod.

53,823. What do you receive now?—I cannot receive three.

53,824. Have you never had any other kind of fish?—I have had flounders, codling, and herrings out of the Solway.

53,825. What do you get now; what description of fish?—About two or three stone of flounders a day, and there may be some months when I do not get a flounder at all.

53,826. When did the decline begin to show itself very evidently?—Four or five years ago, but the greatest decline was last year. It was a total decline then.

53,827. How does it appear to be this year?—I cannot say there has been much difference yet.

53,828. As compared with last year?—Yes, compared with last year, we have had very little more this year; only very few.

53,829. Have you been doing better this year?—Perhaps a little better.

53,830. What kind of fish are you getting now?—Flounders, out of the Solway.

53,831. No cod or codling?—No.

53,832. Any whiting or haddock?—No.

53,833. Did you never get those kind of fish?—Yes, I have had them both, but not for the last seven or eight years.

53,834. (*Mr. Lefevre.*) Has there been a total disappearance of the haddock?—Yes, a total disappearance of the haddock for the last seven or eight years.

53,835. (*Mr. Caird.*) There never were a great many haddock here, were there?—No; there never was a good fishing in the Solway for haddock.

53,836. At what time of the year was it carried on?—Between this time and Christmas.

53,837. How long during the whole season do you usually get a supply of the description of fish you refer to as being taken now?—This is the best flounder-fishing season; it goes on from August until the latter end of November.

53,838. What have you after November?—The fishing always falls off then. We get haddock and other stuff from Edinburgh.

53,839. But tell us what you get out of the Solway?—Flounders all the season through from the Solway. They are the principal fish we get in this town from the Solway.

53,840. Do you get very little fish besides flounders?—We get cod through the winter, or rather we did; we do not now.

53,841. Do you get any turbot?—No.

53,842. You never had any, I suppose?—I have seen three or four come out of it, that is all.

53,843. And soles?—Yes, but they are very small. They are very little soles that come out of the Solway.

53,844. You say the decline began seven or eight years ago?—Yes.

53,845. And what do you attribute that decline to; was there any particular kind of fishing introduced for the first time that had not been before followed, or was there anything which you can assign as the probable cause of the decline?—There are some boats which come in here to fish for shrimps in the Solway, and that is the cause to which we assign the falling off. They kill a terrible heap of the small brood; they kill flounders only as long as the nail of your finger, or a little longer.

53,846. Did those shrimp boats come for the first time between seven and eight years ago, when the decline in the flat-fish began?—It is about 10 or 11 years since they first came.

53,847. Did they fish for some years without causing any injury to the supply?—We did not notice it till seven or eight years ago; we noticed it most then.

53,848. Have those boats increased in number?—Yes, a great deal.

53,849. Are they increasing now?—I cannot say at present whether they are increasing, but there are about 25 or 30 of them, as far as I can tell at present.

53,850. Do they fish during the whole of the year?—Yes.

53,851. Do they spread themselves over a large portion of the upper waters of the Solway?—Yes, through the whole Channel.

53,852. Have they continued to fish very much on the same ground during all the time you mention?—As near as I can tell they fish about 10 or 11 miles up and down the water.

DUMFRIES.

J. Patterson.

29 Sept. 1864.

53,853. And their object is to trawl for shrimps?—For shrimps entirely.

53,854. Have you yourself ever seen them at work?—Yes, but I was never in their boats. I have only seen them off the shore.

53,855. Have you seen them fishing?—Yes.

53,856. Have you seen what their nets had caught when they came on shore?—I have seen small flounders taken out of them.

53,857. Have you seen small flounders in their boats?—No; among the shrimps when they brought them on shore.

53,858. Was there a large proportion of small flounders?—Yes, a great deal.

53,859. What did they do with them?—They threw them in the water.

53,860. Were they of no use for food?—None at all.

53,861. How many baskets of small flounders, or how many pounds weight or stones weight at one haul have you seen thrown into the water as useless?—I am a fish dealer at Dumfries; I am not always down at the fishing. I cannot say what they may have done in that way. I was never there only once or twice.

53,862–5. Then have you not observed it personally?—No, only once or twice.

53,866. Have you any other observation to make to us in reference to the supply of flat-fish?—I can say nothing, except that I think that it is the shrimp-boats which are causing the destruction.

53,867. Has the price of fish altered much within your experience here?—When I first started I got them for 6*d.* and 8*d.* a stone, and now I give 1*s.* 2*d.* and 1*s.* 4*d.* and 1*s.* 6*d.* a stone. I have sold them at 1*d.* a pound, but I cannot sell them now under 2*d.* and 3*d.* if I am to make a profit.

53,868. When did the considerable rise in price begin?—It has been rising for four or five or half a dozen years.

53,869. Has it been rising gradually?—Yes, regularly; a penny one year and a penny another year.

53,870. Do you get the greater proportion of the flat-fish caught in this part of the Solway near Dumfries?—I consider that I get one half of them.

53,871. Half of what come to Dumfries?—Yes.

53,872. But are all that come to Dumfries a large proportion of what are caught in the upper part of the Solway?—Yes, we get here three parts of what are caught in the Solway.

53,873. Has there been any change in consequence of other places coming into competition with you in the demand for those flat-fish?—No, we have the best demand here, and we give the highest price for the flat-fish of any market I know of.

53,874. Are none of them taken at Whitehaven, or at any of the ports on the English side of the Solway?—A few go to Carlisle.

53,875. Does not Carlisle take as much as Dumfries?—No, it does not.

53,876. From your knowledge of the trade in fish here would you say that the proportion of flat-fish taken to Carlisle now is not larger than it was eight or nine years ago, when you had the principal supply for Dumfries?—I consider that there is very little more going to Carlisle now than did, not of that kind of fish. I consider that we get the greatest portion of the fish caught in the nets in the Solway, the same as we did nine or 10 years ago. We get nearly all the net fish.

53,877. Are flounders caught in nets?—Yes.

53,878. Are they all caught by nets?—Yes.

53,879. How are those nets set?—They are set with stakes.

53,880. They are stake-nets?—Yes.

53,881. Do they go down to the bottom?—Yes; they are set on end. They go down to the bottom, and are pinned down to the bottom.

53,882. Are the fish taken at low water?—Yes.

53,883. When the tide goes out?—Yes.

53,884. Do the fishermen ever get anything in the nets except flounders and flat-fish?—I never saw anything except flounders and cod.

53,885. Did you ever see any salmon?—I never knew salmon taken in them.

53,886. Are those nets permitted now?—Yes.

53,887. Is no objection made to them?—No.

53,888. (*Mr. Lefevre.*) Do you know what is the size of the mesh of the net?—No.

53,889. Do you know what number of men were formerly employed in fishing for flounders in this way, say 10 years ago?—There were a great number of men employed then, but they have fallen off because they could not make wages at it.

53,890. Did the same men go out fishing with the line in boats?—No, not that I know of. They fish the cod with lines out on the sand. They have caught a heap of cod with lines on the sands.

53,891. They are not regular fishermen, are they?—They are regular fishermen; they do nothing else.

53,892. What is the size of the boats they have?—They have no boats; they fish at low water.

53,893–4. They do not use boats, and do not go out into the deep water at all?—No.

53,895. Then is the shrimping quite a recent trade here?—It is a recent trade with the boats.

53,896. Have the fishermen here taken to shrimping themselves?—No; they come out of Lancashire when they come here.

53,897. Where do they send their shrimps to?—Into Lancashire and all up and down.

53,898. Do they send them to Dumfries?—Yes, a few, and a few to Glasgow.

53,899. How many men go in a boat?—Either one or two.

53,900. Is there any trawling in the Solway Firth?—Do you mean beam trawling?

53,901. Yes.—There is a little beam-trawling for flounders for two or three months in the year.

53,902. How many boats engage in it?—The shrimping boats, when the shrimping falls off, try it.

53,903. What is the season for shrimping?—I cannot tell. They shrimp in the summer time and not in the winter, that I know of; if they do it is very little.

53,904. Do you know what bait they use for the cod?—Small flounders.

53,905. Do you think it would be possible to carry on shrimping without causing this destruction of small fish?—Not to my knowledge.

53,906. Then would you propose that shrimping should be done away with so as to increase the supply of flounders?—I cannot tell that, but if those boats are to continue shrimping there will be no flounders at all. That is my belief in the matter.

53,907. What number of men are there employed in catching flounders in the way you speak of?—I cannot say; they have a great deal fallen off on the coast. There is such a scarcity of fish that they cannot get a living by it.

53,908. Can you say how many men used to be engaged in the fishing?—At one time there were I daresay 50 or 60, but there is not one-third of that number now.

53,909. Are they reduced to 14 or 15?—Yes, they have been reduced to all that.

53,910. Are there any shrimpers here to-day?—Yes, I believe so.

The witness withdrew.

JOSEPH BURNIE called and examined.

53,911. (*Mr. Caird.*) Are you a fisherman at Powfoot, near Dumfries?—Yes.

53,912. In the Solway?—Yes.

53,913. Have you been for some years a fisherman there?—I have fished since I have been a boy backward and forward. I have been at work for 24 or 25 years.

53,914. Have you been fishing chiefly for flounders?—For flounders, codling, and large cod in the season.

53,915. Always with a net?—With lines for the large cod, but with stake-nets for the flounders and codling.

53,916. Have those stake-nets been long in use?—Yes, long before my remembrance, or that of the oldest man I ever heard speak of the matter.

53,917. Give us a description of the mode in which you set your net, and what the size of the mesh of the net is, and its length and depth?—The size of the mesh is three inches and three-quarters.

53,918. Is that from knot to knot?—It will be seven inches round. As to the size and length of the net, I can hardly give that; it depends on the ground. Some of them will not be 10 yards long, and some will be from 15 to 18 yards, and some more than that. The flatter the ground the larger net we consider it takes.

53,919. What is the depth of the net?—Between five and six feet.

53,920. Is it set perpendicularly up and down on the stakes?—Yes.

53,921. And with a foot-rope on the sand?—Not on the sand, on the scar.

53,922. You set them up on a scar?—Yes, if we can get it; if not, we set them on the sand in the same way.

53,923. Is there a bag in the net?—No, there is a bit of a head where the fish go into.

53,924. Cannot they get out of the head?—They do sometimes with the tide.

53,925. Is there nothing to prevent them from swimming out?—No; they can come out the same way they went in.

53,926. Are they caught with the rising or the falling tide?—Some are caught with the falling tide only, and some with both the rising and the falling tide.

53,927. Is not the net so placed that you can catch fish with both tides?—Some of them are caught in both ways, but most are taken with the falling tide.

53,928. You do not bait the net in any way?—No, and it is only the flounders feeding on the scars that come into it.

53,929. Do you get small flounders in the net?—Yes.

53,930. In what state are they when you get them as the tide comes down?—They are quite alive.

53,931. Do you never get any that are too small to be used for food?—For the market?

53,932. Yes?—There are some too small for the market, but we give them to the poor people for food.

53,933. They are of no use for the market?—We have got them when they have not been of any use for the market.

53,934. When you get them in that state cannot you throw them into the sea again?—There is nothing to hinder us.

53,935. Has not the tide left you?—No; there is water close at hand.

53,936. Do you throw them into the sea again?—We do generally.

53,937. (*Mr. Lefevre.*) Are they left bare on the ground by the tide?—Yes, some of them, and some of them close in at low water.

53,938. (*Mr. Caird.*) Have you even seen any large proportion of the fish caught in your nets that were small, and unfit for the market?—I have seen a good quantity.

53,939. Half of them?—No, not half of them; I never saw half of them.

53,940. What would you consider a good take with your nets?—Since I commenced to fish I have sent upwards of 40 stone out of my net in one day.

53,941. When you got 40 stone of marketable fish, how many stone would there be not fit for the market?—I cannot give any certain answer to that question.

53,942. Can you give us no idea?—There would be from five to six stone.

53,943. Which would be lost?—Yes, sometimes; but frequently the flounders are in that way that there are very few small ones among them.

53,944. Has the number of men engaged in that mode of fishing increased of late years?—No.

53,945. Have the number of nets employed in it?—No; since I can remember there were more nets than there are at the present time.

53,946. Then the fishing has diminished rather than increased?—Yes.

53,947. Have you lately taken such good takes as those you just mentioned to us?—No.

53,948. How long is it since you took that quantity?—I have taken it within 10 years, but I cannot mention the year.

53,949. What have been the best takes you have had this year?—Another neighbour has been fishing with myself, and our best takes have been three stone and three and a half stone.

53,950. In a day?—Yes.

53,951. What would the average be in former times?—From 10 to 15 and 17 stone, and from that to 20 and 30 stone a day.

53,952. Then it has diminished?—At the present time three and three and a half stone are all the quantity we can get.

53,953. Do you never in an exceptional case get a good haul?—We have not done so of late years.

53,954. Have you never had any good haul at all within the last year?—Not at all. I have not sent in more than six or eight stone at a time.

53,955. When did you begin to notice that the fishing was decidedly falling off?—It is now some eight or 10 years since we first saw the falling off.

53,956. You fish on the Scotch side of the Solway?—Yes.

53,957. Is the same mode of fishing practised on the English side?—No.

53,958. Is there no flounder-fishing in the same way in England?—No, there is a law for our side and not for theirs.

53,959. Is there a law on the English side to prevent that mode of fishing from being adopted there?—I cannot say that.

53,960. Is there any ground for fishing there?—Not as much as there is on our side.

53,961. Has that been the case since you have been fishing?—Yes, I have seen the Channel miles from us and now it is closer to us.

53,962. You do not remember to have seen the English fishermen fishing in the same way?—I do not remember to have seen them.

53,963. Have they any mode of catching flounders on the English side?—Yes, they have what they call poke-nets.

53,964. Then they have a mode of catching flounders with a net, but it differs from yours?—Yes.

53,965. Do you know if it is a more deadly mode of catching fish, or why do you adopt a different system from them; is there anything in the character of your shore which causes the difference?—I think use and habit are the only difference. We have been used to nothing else than peedle-nets and they have been used to theirs. Nothing else besides peedle-nets are used on the Scotch side of the Firth.

53,966. Have those poke-nets been used for a long time on the English side?—Yes.

53,967. Are they increasing in number?—I cannot say that.

53,968. Do the men who fish those poke-nets on the English side complain of a scarcity of flounders

DUMFRIES.

J. Burnie.

29 Sept. 1864.

now?—I cannot say. One individual I know has a boat and fishes for shrimps.

53,969. What is the nature of the poke-net?—It is set on the sands. Each net goes between two sticks set in the ground with a large pocket hanging down.

53,970. Is it a swimming net fastened at both ends?—It is fastened at each side to a stick.

53,971. And the bag of it swims with the tide?—Yes, it hangs down.

53,972. (*Mr. Lefevre.*) Is it dragged along with boats?—No, it is fixed on sticks.

53,973. (*Mr. Caird.*) I suppose the net is fixed to those sticks at low water when the tide is out?—Some of them are a good way off from low water.

53,974. Those nets are not set by means of boats, are they?—No.

53,975. People work at them when the tide is out?—Yes, they were never used with boats. Boat-fishing was never practised in our quarter at all until the shrimp-fishing commenced for no sort of fish.

53,976. Then are we to understand that the poke-nets used on the English shore and the Scotch stake-nets have both been employed in fishing for a long time for flounders in the Solway?—Yes, since the memory of man and from time immemorial we have had stake-fishing nets on our side.

53,977. Then when did you begin to find your flounder-fishing falling off?—Within the last 10 years.

53,978. Did you sometimes catch cod in those nets?—Small cod, and occasionally large cod. We have sometimes got a good quantity of small cod.

53,979. At that time shrimp-fishing became a matter of some importance?—It commenced in operation then.

53,980–2. Do the shrimp fishers come near to your nets?—They go anywhere the ground will permit. They cannot trawl shrimps on the scars, but if it be sand they can come quite near. It is all on the sand they trawl.

53,983. Have you observed them trawling?—Yes.

53,984. Have the shrimp men increased in number?—I think they have increased a little for the last two years.

53,985. Do you know what number of them are employed in catching shrimps?—Between 20 and 30 at present, but I have seen more than 30.

53,986. What is the size of their nets?—I do not know exactly, but take them on the average they will have a 20 feet or 30 feet beam. Some have a beam larger than that. They have two beams and each net will be 40 feet at the very least.

53,987. Each boat has two beam-nets?—Yes.

53,988. One on each side?—One at the stern and another at the bow. They go on each side with the stream.

53,989. You say you have seen them taking the shrimps?—Yes, I have.

53,990. Did you ever notice anything besides shrimps in their nets?—Yes, a good deal of white-fish fry.

53,991. What kind of white-fish?—Both flounders and codlings.

53,992. The young of those fish?—Yes, not the size of my thumb nail or very little more.

53,993. Was there any large quantity of that?—Yes, a large quantity. I have seen a good deal in the nets.

53,994. Did they draw their nets on board in the boats?—Yes.

53,995. What did they do with the fry?—They riddled the shrimps out of it and threw the rest overboard.

53,996. Was it alive when it was thrown overboard?—I do not consider that it would live at all.

53,997. Would it have as good a chance of living as the fry you catch?—No.

53,998. Why not?—They draw the trawl round with great pressure upon the fish and being so young they cannot live.

53,999. Are they smaller fish than yours?—Yes, ten times smaller than ours.

54,000. Is there any large quantity of those small flounders in their nets?—I suppose they do catch a good quantity.

54,001. You think that that has really caused a great destruction to your fishing?—Yes, since it has been practised the fish have become very scarce compared with what they used to be.

54,002. Are the shrimpers themselves beginning to destroy their own fishing by taking it up so much?—Yes, I think so. When they commenced to trawl for flounders they got from 20 to 40 and 60 and 80 stone in a tide. They have been trying it this season and four or five stone was all they could get.

54,003. Do the shrimpers trawl for flounders?—Yes.

54,004. Do they use the same net?—It is a larger mesh, but still it is a very straight net.

54,005. Do you know the size of it?—I saw one only yesterday.

54,006. Have they as shrimp fishermen begun to find that the shrimps have fallen off?—That I cannot say. I cannot answer that question.

54,007. (*Mr. Lefevre.*) Do you know what number of these stake-nets there are set along this side of the Solway?—No, I cannot tell the number.

54,008. How many men does it take to look after these stake-nets; does it take more than one man?—Some may have two or three small stake-nets.

54,009. May they set their stake-nets anywhere along the shore they like?—Yes, wherever they think the best position is for catching the fish.

54,010. Are they set permanently there or do they move them about?—They move them if they think they can get a better place.

54,011. How long are they allowed to remain in the same place?—I have known a net which has been in the same place for 30 years since we first occupied it.

54,012. Then you cannot say what number of men are employed in this way?—No; but there are a large number.

54,013. There used to be more?—Yes.

54,014. Are they men living at Annan?—No, all along the coast; the whole of the shore. They fish all the way.

54,015. Are these nets set all the year round?—Yes.

54,016. Do they catch flounders in them all the year round?—Yes, all the year round.

54,017. Do you think there could be any mode of regulating the shrimping so as to prevent the shrimp-nets from catching the small flounders?—That was considered when a petition was presented on the subject. It was left to the board to consider it.

54,018. Have you no suggestion to offer upon the matter yourself?—No.

54,019. Is there no suggestion you could make yourself to regulate the fishing and to prevent the catching of small fish?—I cannot say. There might perhaps be a time specified for the fry, but who can tell when the white-fish spawn. If we knew when they spawn there might be something done to preserve the spawn and the brood also.

54,020. Do you know when they spawn?—I think they spawn at different times of the season.

54,021. Not at one time of the year particularly?—The most part of them may spawn at a particular time, but I have known them spawn at all times.

54,022. Is there any time of the year when you catch more small flounders than another?—There is no time more particularly than another.

54,023. You catch the same proportion all the year round?—The same proportion of flounders; neither large nor small is got all the year round now.

54,024–5. There are no months in the year when you catch more small fish than in other months?—In the spring of the year we catch the most.

54,026. Do you catch many other small fish besides flounders?—I have seen young codlings caught.

54,027. Of what size ?—They cannot be large because the mesh is small that they have to get through.

54,028. What size are they ?—The size of a child's finger.

54,029. Do you catch a great number of them ?—I cannot say that.

54,030. Have you seen them yourself ?—Yes.

54,031. And any other kind of fish ?—I have seen some chance young herrings.

54,032. Do the herrings come up the Solway ?—We used to have a good fishing of herrings.

54,033. How long is it since you had any ?—Ten years since.

54,034. Were there herring-boats regularly employed ?—No ; when we caught them we got them in the stake-nets.

54,035. You never had any boats ?—No.

54,036. You always caught them in the stake-nets ?—Yes.

54,037. Did they come regularly ?—Yes.

54,038. Every year ?—Yes, for many years before that we had a very good fishing although it was not always regular.

54,039. Did the herrings form any considerable portion of your earnings in the year ?—Yes.

54,040. The fishing has fallen off ?—Yes, the last year we had them was in 1855 ; we had them then for about a month or five weeks, and there were three or four of us who got between 30*l.* and 40*l.* worth.

54,041. What is the season for shrimping now ?—Just whenever they can get them.

54,042. When does it begin ?—There is no particular time.

54,043. Do they fish all the year round ?—Yes.

54,044. I thought you said that during some portion of the year they fished for flounders ?—Yes, part of the time, but not all.

54,045. What time of the year is that ?—They commence generally at this season of the year.

54,046. For how long do they trawl ?—Perhaps until a storm comes on, if there be a storm.

54,047. (*Mr. Caird.*) Have you, the net fishers for flounders, come to any agreement among yourselves as to using a larger meshed net for the future ?—Yes.

54,048. What is the agreement ?—We are to have the net of a 4-inch coil.

54,049. Do you think you have been using nets with too small a mesh ?—We thought that we would try to make an improvement as well as other people, and see if we could get the thing mended in that way.

54,050. Have you done so in the belief that you yourselves were to some degree injuring the brood of the fish by killing small fish ?—Yes, we considered that some that we took were not fit for the market, and that it would improve the brood to increase the size of the mesh.

54,051. You came voluntarily among yourselves, the whole of the fishermen on the Scotch side of the Solway, to an agreement to use a larger mesh ?—Yes, in all our district ; we held regular meetings about it, and all agreed upon that system.

54,052. (*Mr. Lefevre.*) When was that regulation made ?—It was not a regulation but an agreement among ourselves.

54,053. When was it made ?—In November or December last year.

54,054. Then sufficient time has not elapsed to enable you to say whether it has been of any use to your fishing ?—No.

54,055. Are you using the large mesh now ?—A good many are.

54,056. You have not all altered your nets ?—Not all.

54,057. If something was done to enforce a regulation among other people, you would be willing to adopt that plan ?—Yes, we would take it upon ourselves as well as put it upon others.

54,058. Do you yourselves consider that a sufficient mode of preventing the destruction of the fry of the fish ; if a regulation to that effect were imposed upon all the other fishers for flounders would that secure your object ?—We considered that the mesh ought to be increased, and that it would lead to an improvement in the white-fish.

54,059. Of course it would be impossible in the Solway Firth to catch shrimps with nets like that ?—Yes.

54,060. Then there is nothing for it but that the shrimping should cease entirely ?—Yes, unless something could be adopted to ascertain the spawning and breeding time, and then we might have a time allowed for it.

54,061. If it could be ascertained at what time the greatest destruction takes place to the fry of the fish, and if fishing were prevented during that time, might it be followed at other times of the year without any serious injury to your fishing ?—Yes, when the flounders get into more strength.

54,062. What would be the months when the flounders would be in such strength that they would not be likely to be injured in this part by the mode of fishing for shrimps ?—I cannot say ; I do not know ; you had better ask some one who knows more about the brood of fish than I do.

54,063. You are constantly engaged in the fishing?—Yes.

54,064. And have been so for many years back ?—Yes.

54,065. Have you not observed the time when the fish are in the greatest strength?—Yes.

54,066. What months of the year is it ?—They begin to lose strength sometimes in November, I think about the hinder end of November.

54,067. From November until when ? — The flounders are a great deal worse until May in this country.

54,068. From November until May ?—Yes.

54,069. Would you propose on the part of the flounder fishermen that the shrimp-fishing should be discontinued from November until May ?—I have not come here to propose anything of that sort.

54,070. Would you suggest it ; we wish to get at what you think, as a practical fisherman, would be likely to benefit your fishing ?—It would be a great improvement, because from the unusual multitude of boats trawling, and the length of their beams, the whole of the ground is swept clean, so that there is no place for the white fish to lie.

54,071. Does anybody trawl for the fish except the shrimpers ?—No.

54,072. When do the shrimpers lay aside their shrimp-nets and begin to trawl ?—Some of them do not lay them aside at all.

54,073. Is there one season for the flounders and another for the shrimps ?—There is none for the flounders.

54,074. Did you not say that some of the men who used the shrimp-net also used the beam-trawl for flounders ?—Yes, some of them do.

54,075. Then do those who use the beam-trawl discontinue shrimping ?—Yes.

54,076. When ?—They commence generally about this time of the year ; some of them have commenced now.

54,077. From the beginning of October up till when ?—As long as they can get them.

54,078. As long as they can get the flounders ?—Yes.

54,079. During what months are the best flounders got ?—Generally the largest quantity is got from now till New-year's day.

54,080. The largest quantity is got from this time until the beginning of January ?—Yes.

54,081. You say they begin to lose their strength in November ?—Yes. We have got a large quantity in the spring of the year ; sometimes we have caught more in the spring of the year than in the back end after they have begun to lose their strength. We

DUMFRIES.

J. Burnie.

29 Sept. 1864.

have had a large quantity of flounders in our nets in February and March.

54,082. Is the number of fishermen who trawl for flounders increasing?—No, not to my knowledge.

54,083. You said something about there being such a number of boats trawling in the Solway that they were cleaning up the whole of the ground?—That is for shrimps, not for flounders.

54,084. They are not more numerous than they were?—No, they are fewer.

54,085. Still they are so numerous that they take up all the ground?—Yes.

54,086. Have you ever trawled for flounders yourself?—I have.

54,087. What success have you met with in that mode of fishing?—Sometimes very fair.

54,088. Can you make more of it in that way than by your stake nets?—No, I never could.

54,089. Do you think that half the shrimpers take to trawling for flounders at this time of the year?—I cannot say; I never saw half of them do it.

54,090. But a considerable number of them do?—Yes.

54,091. Have you altered your own nets yourself by enlarging the mesh?—My nets have been altered, but they were altered before we commenced this petition.

54,092. Have you caught fewer small flounders since then?—I have.

54,093. What is the smallest you catch now?—We get very few that we do not send to the market.

54,094. Almost all you get are fit for the market?—Yes.

54,095. What do you mean by the fish losing their strength?—They begin to spawn then, and they do not keep in such good order.

54,096. I thought you told us that some of them were spawning all the year round?—There are fish of different kinds that spawn all the year round.

54,097. But the flounders?—That was my meaning.

54,098. Do you think a great number of them spawn at the beginning of the year?—Yes.

54,099. But still that some of them are spawning all the year round?—Yes.

54,100. (*Mr. Caird.*) You said that you had been a line fisherman for cod?—Yes, for large cod.

54,101. Have you within recent years been so engaged?—I tried it last year.

54,102. And with what success?—I got nothing.

54,103. How long is it since you had any success?—It is a good many years.

54,104. Was there much line-fishing carried on then for cod?—Yes, a good deal.

54,105. In what particular part of the Solway?—On our own banks.

54,106. Are there not cod to be found there now?—There has not been for several years.

54,107. (*Mr. Lefevre.*) Did you take a good number of codling in your nets?—Yes.

54,108. At what time of the year?—About Martinmas time.

54,109. Do you take large sized cod also in your nets?—Very rarely, but we do sometimes.

54,110. Did the codling form a considerable portion of your take in the year?—Yes, at that season.

54,111. Do you think the taking of the codling did any injury to the taking of the larger cod outside?—I do not know. There is no doubt that taking the codling would keep them from growing larger.

54,112. Is there any fishing further out in the bay by a larger class of boats coming from Liverpool or other places?—Other boats?

54,113. Yes, the larger line-boats?—The fishing is always confined to within low-water mark, or nearly so. The Channel is not above three quarters of a mile broad at the most.

54,114. Further out in the bay are there no line fishermen with larger boats?—No, there is nothing of that sort.

54,115. (*Mr. Caird.*) Do you remember any time when there was a good sole-fishing here?—No.

54,116. Or a good turbot-fishing?—No.

54,117. Has there never been a good sole or turbot fishing here?—No; they have got soles, but they have been very small.

54,118. Is it chiefly the flounders that have shewn a marked decrease?—Yes, chiefly flounders.

54,119. Are there any shell-fish caught here; any oysters?—There are no oysters in our Firth.

54,120. Are there no oyster beds?—No; there are mussels.

54,121. Are there lobsters?—I have seen an odd one.

54,122. Do they form any part of the fisherman's business?—No, none follow that occupation.

54,123. You say there are mussels?—Yes.

54,124. Are there good mussel beds?—Yes, and cockles.

54,125. Are there good mussel and cockle beds?—The mussels are but small at present, but there are good cockle beds.

54,126. Were the mussel beds ever very extensive?—I have seen them very good.

54,127. Were they taken for bait?—No.

54,128. For the market?—Yes.

54,129. For food?—Yes, they were sent to Carlisle market.

54,130. Are the beds not as good now as they were?—No, they are not so large.

54,131. Have you ever fished them?—No, they have shifted backward and forward. The stream is strong, and they never have time to grow.

54,132. Is that because you take too many mussels away?—No, we have not sent them away for many years.

54,133. Where are the cockle beds?—On the sand banks further down.

54,134. Do they yield large quantities of cockles?—Yes.

54,135. Are they regularly fished?—Not now.

54,136. Are they gathered when the tide goes out?—Yes.

54,137. Why are they not gathered now; is there no market for them?—No, the market is not so easily got at.

54,138. There is no want of cockles?—No.

54,139. Does anybody come here to get bait; do any fishermen come from other quarters?—No. We have sold bait at the Dumfries market to go to the west for large cod, but none come to us for bait.

54,140. (*Mr. Lefevre.*) Did you take haddocks in the stake-net?—At the time we had them we did.

54,141. Did they disappear about seven years ago?—Yes.

54,142. Then now you have lost both the haddock, the herring, and the codling?—Yes, we have had none of those kinds of fish for some years.

54,143. Did the herrings come every year, or did they come at intervals after the lapse of a few years?—They came at intervals.

54,144. Ten years ago is the last time you recollect the herrings here?—Yes.

54,145. Previous to that, how long was it?—Four, or five, or six years. They fished them regularly before that.

54,146. Regularly every year?—Yes.

54,147. You are quite sure of that?—Yes.

54,148. (*Mr. Caird.*) Is there any large herring-fishing here at any time?—The boats often come up and fish along this place.

54,149. Were they taken to the fresh market or cured?—They were taken to the fresh market.

54,150. Has there been any marked change in regard to the herring-fishing here?—The herring-fishing is not a regular fishing in our Firth.

54,151. It never has been at any time?—Never in my time, except a few in the winter and summer. In the summer season we get them in May and June.

54,152. (*Mr. Lefevre.*) The shrimping began then?

—Yes, but at that time it was only carried on on a very small scale.

54,153. (*Mr. Caird.*) What is the smallest sized mesh you at present use for flounder-fishing in the stake-nets you have described?—What I told you is the smallest I ever knew to be used.

54,154. By any of the fishermen?—Yes. There are none less than three and three quarters of an inch coil.

54,155. Then, as far as your knowledge extends, there are no smaller meshes used?—Not that I know of, but I have not examined all the nets.

54,156. You are not aware of any less?—No, but I am aware that there are many of them fishing with a 4-inch coil, and have been doing so for some years back.

54,157. (*Mr. Lefevre.*) What is the cost of a stake-net?—It depends on the size.

54,158. Take an ordinary average-sized one?—I cannot give you an estimate.

54,159. (*Mr. Caird.*) Some years ago did you use a smaller mesh than you do now?—I never did.

54,160. Did any of the fishermen in the same way of fishing?—I am quite aware that they did. Some were taken up for it, but it was only an exceptional case or two. It was not the general rule.

54,161. It was not common?—No, it was only some old nets that had been condemned by the salmon-fishing system.

54,162. (*Mr. Lefevre.*) Are the meshes of the net in the trap smaller than in the other part?—Yes, smaller than the rest of the net.

54,163. (*Mr. Caird.*) Your smallest mesh is three and three quarters?—Yes.

54,164. That is the smallest mesh you have in the net?—Yes.

54,165–6. Do you know what the flounders feed upon?—Yes, I think they feed upon mussels a good deal, and upon shell-fish they call fritters. They are small fish which grow the same as a cockle, but they are not ribbed on the shell.

54,167. I suppose that as food for flounders the mussels have increased?—There are plenty of mussels for the flounders. There are so many of them that we have carried hundreds of cartloads to manure the land. We can do that at the present day.

54,168. Are there plenty of mussels left now for any purpose?—Yes.

54,169. And are there plenty of that other description of shell-fish you mentioned—fritters?—Yes, there are plenty.

54,170. Do you not imagine that there may be some reason in the notion that the decline in the flounders may have arisen from the food on which they live having ceased to be plentiful?—I believe it is plentiful; but my opinion is that the decline in the flounders is in consequence of killing the young ones off altogether.

54,171. (*Mr. Lefevre.*) Have the mussels not grown to any size of late years?—Not to any size for the market.

54,172. Is that quite within the last two or three years, or has it been the case for some years?—It is many years since I sent any to the market.

54,173. Notwithstanding that, has there been a great supply of small mussels?—Yes, they have come and gone every year.

54,174. How is it that they have had such a number of small ones, and have never increased?—If they get covered over with the sand they die. When they strike the scar, you see it covered all over with them like gunpowder.

54,175. Does it take some months for them to grow up again?—In two or three months they are fit for the flounder. There has not been more scar at our place than there is at present for many years back, and where the scar is the mussels will grow.

54,176. There is more scar now than formerly in your remembrance?—Yes.

54,177. And, therefore, there is a greater supply of mussels?—Yes.

The witness withdrew.

GEORGE GRAHAME called and examined.

G. Grahame.

54,178. (*Mr. Caird.*) Are you a fisherman?—I have fished.

54,179. In the same manner as the last witness?—Yes.

54,180. You have heard his evidence?—Yes.

54,181. Do you generally agree with what he has stated?—He has stated my opinion.

54,182. Have you found that the supply of flounders is very much on the decline?—Yes, it is very much on the decline.

54,183. And you attribute that to the extensive shrimp-fishing practised in the Solway?—That is my opinion.

54,184. Can you give us any information in regard to the size of the mesh of the net used in the stake-fishing?—There is nothing I can say beyond what the last witness said.

54,185. Do you agree entirely with him as to the size he mentioned?—Yes.

54,186. You have not seen a smaller size used generally?—Not a smaller size for stake-nets.

54,187. Have you seen a smaller size used for any other purpose?—Well, I cannot say.

54,188. Have you ever fished for shrimps yourself?—I have seen them fished.

54,189. Do you ever fish for them yourself?—No.

54,190. Have you seen small fry taken in the shrimp-net?—A good deal.

54,191. What became of it?—It was thrown away because it was of no use.

54,192. Was it chiefly alive or dead?—Dead.

54,193. And was it entirely lost?—Yes, entirely lost.

54,194. (*Mr. Lefevre.*) Was it brought to the shore?—Yes.

54,195. It was not thrown overboard at once after taking the net up?—No.

54,196. Supposing it was thrown overboard as soon as the net was taken up, would not the small fish be then alive?—I cannot say, but I think not.

54,197. (*Mr. Caird.*) Is there any mode of catching shrimps that could be adopted other than the present mode that would obviate the destruction of the flounder-fishing?—I have known them caught with a net shoved before the fishers.

54,198. With hand-nets?—Yes.

54,199. Was that a less destructive mode of fishing as regards flat-fish?—I never saw them caught in that way.

54,200. Did they catch as many shrimps in that way?—No.

54,201. It is not such an expensive mode of fishing?—It is not as expensive.

54,202. But I suppose it is more expensive if you consider the quantity of shrimps taken?—No.

54,203. Can two men manage a shrimp-boat?—Yes.

54,204. Then it must have been a more expensive mode of fishing?—Yes, but the tackle was not as expensive.

54,205. But the produce of the fishery was very different for the same amount of labour?—Yes.

54,206. Are you sufficiently acquainted with the shrimp-fishing to tell us how it is carried on?—No.

54,207. (*Mr. Lefevre.*) Do the shrimp fishermen live at Annan?—Yes, many of them.

DUMFRIES.

G. Grahame.

29 Sept. 1864.

54,208. Do the stake fishermen mostly live there too?—No.

54,209. Where do they live?—Along the shore.

54,210. Are they stake fishermen all the year round?—Yes.

54,211. Do they do nothing else?—Nothing else when they can get fish.

54,212. Do they cultivate any land—any potato ground, or anything like that?—There are people who fish who cultivate land likewise.

54,213. Do you know what number there is of them?—I could not say exactly.

54,214. Have you anything more to tell us beyond what the last witness told us?—No, nothing.

The witness withdrew.

J. Scott.

JOHN SCOTT called and examined.

54,215. (*Mr. Caird.*) Have you been a stake fisherman?—Yes, I have.

54,216. Have you heard the evidence of the two previous witnesses?—Yes.

54,217. Do you agree with them generally?—Yes.

54,218. Is there any suggestion you could make to us by which in your opinion the flounder-fishing could be benefited?—Yes. I remember in the year 1859 I was employed to repair the embankment of the river at Annan, and when I went out to assist in working on the west side these boats came in at high water, and they threw a large quantity of fish over the side of the boat that was not fit for the market.

54,219. What kind of fish?—They were flounders. They were destroyed for the market altogether and were thrown over the side.

54,220. Are you speaking now of the shrimpers?—Yes.

54,221. Were they in the habit of coming into the mouth of the river Annan in order to send their shrimps to market?—Yes.

54,222. Do they do so still?—Yes.

54,223. Was there a large quantity sent to the market then?—Yes.

54,224. Is there so still?—No, it has declined since.

54,225. What suggestion can you make to us; you said you could offer one by which the flounder-fishing could be improved?—I think that if the mode of fishing by shrimp-nets were altered and another mode of casting up the nets were adopted it would do good.

54,226. Do you know any other mode by which shrimps could be caught?—No, I cannot say that.

54,227. Did you ever hear of them being caught in any other way that would not be destructive of small fish to the same extent?—No.

54,228. Then the only remedy would be putting a stop to that other fishing?—Yes.

54,229. Which of the two is the most valuable?—I think the white-fishing.

54,230. Which bring the most money to the men occupied in fishing in the Solway?—I cannot say as to that—which of them makes most money, but I think the flounder-fishing is the most valuable to the poor man.

54,231. Do you mean in getting food within his power to pay for?—Yes.

54,232. The shrimps go, I suppose, to the wealthier classes of the people?—Yes.

54,233. But then as to the advantage of the fishermen; is it not to the interest of the fishermen to get an article that brings the highest price?—I can say nothing with regard to that.

54,234. Do you not know which does bring the highest price, or which leaves the largest remuneration for the labour employed?—I do not know what they receive for the shrimps.

54,235. (*Mr. Lefevre.*) Do the stake fishermen send all their fish to Dumfries?—They mostly send them to Dumfries.

54,236. Were you a party to the suggestion among the fishermen that the mesh should be increased?—No.

54,237. What is the size of the mesh you use?—Three and three quarters.

54,238. Do you think it would be advisable that the stake fishermen should increase their mesh to four inches?—Yes, I do; but at the same time I think the shrimp-nets are more injurious than the others.

54,239. I presume from that that you yourself do catch a considerable number of small flounders?—Yes, there has been a considerable number caught, but what we have caught we put in the sea again alive.

54,240. But they are left bare at low water in the trap?—Yes, all dry. We take them out when they are dry.

54,241. But they remain for two or three hours if the tide goes down at night until it is light?—We always know when the tide is out, and we go down then.

54,242. Would they be alive when they are thrown into the water?—Yes, they are generally all alive.

54,243. Would that not be the case with the shrimpers?—No, because what they catch in the shrimp-net are all dead before they come to land.

54,244. When they take up their nets are they all dead?—They are not dead then, but they are put down in the boat and kept there until they come into the harbour.

54,245. If they were thrown over when the net was taken up would they be dead?—I cannot say anything as to that.

54,246. Have you observed the fish taken up in the shrimp-nets?—I have seen them in the harbour.

54,247. But not on board the vessel?—No.

54,248. Then you cannot say if they were alive or dead when they came on board in the net?—No.

54,249. Can you tell us anything as to the number of fishermen employed with the stake-nets?—I cannot say.

54,250. (*Mr. Caird.*) Have you any idea of the probable annual value of the whole flounder-fishing on the Scotch side of the Solway?—No, I have not.

54,251. Have you any notion of the number of men engaged in it?—No, I have not.

54,252. Are there a great many?—There have been a great many; but they have been obliged to go to other employments since the flounders have fallen off.

54,253. You do not know what number there is or what there has ever been?—No, I do not.

54,254. (*Mr. Lefevre.*) What can you make yourself by it; what have you been making the last three or four years?—Sometimes more, and sometimes less.

54,255. Can you give us an estimate of what you have been making by it?—I am not a regular fisherman. I have tried it, but not regularly.

54,256. What do you do at other times?—I labour.

54,257. How many weeks in the year are you engaged in fishing?—I cannot tell you.

The witness withdrew.

JOSEPH BURNIE recalled and examined.

54,258. (*Mr. Lefevre.*) Have you been fishing all the year round with the stake-net ?—I have for some seasons.

54,259. What have you been making during the last two or three years ?—Very little during the last two or three seasons.

54,260. How much has it amounted to ?—I ought to have my books with me to tell you that ; but it is not very much. I have had to take to other work in the spring of the year in order to keep myself and family.

54,261. Have you been making as much as 1*l.* a week during the last two or three years ?—No, I have not. I should be very contented to have that.

54,262. What used you to make seven or eight years ago ?—I cannot say.

54,263. Have your earnings fallen off very much ?—They have fallen off very much. I could give you a statement of how much I am sending off to the market now and what I sent before.

54,264. Part of the falling off in your earnings is due to the fact that the haddock, the cod, and the herrings have disappeared ?—We do not count those extra white fish among the flounder-fishing at all.

54,265. Do you only reckon your profits in the flounder-fishing ?—Yes ; it is only the flounder-fishing that we generally calculate upon.

The witness withdrew.

JOHN PATTERSON recalled and examined.

54,266. (*Mr. Lefevre.*) What is the annual amount you pay for flatfish caught by these stake-net fishermen ?—For the last three or four years back I have paid very little.

54,267. Can you not be more precise ?—I can fetch a book and tell you as near as possible.

54,268. Can you do so comparatively for eight years or so ?—Yes.

54,269. We do not want to pry into your business transactions, but only wish to have something like an idea of the value of the fishing ?—I will bring my book.

The witness withdrew.

RICHARD WOODHOUSE called and examined.

54,270. (*Mr. Caird.*) You are a shrimp fisherman ?—Yes.

54,271. Have you been long engaged in the shrimp-fishing ?—Yes.

54,272. Have you been engaged in it since it first began in the Solway ?—Yes, since it first began. I was the first.

54,273. Are you an Englishman or a Scotchman ?—I came from England.

54,274. How long ago is it since you came here ?—10 years last March.

54,275. Has the shrimping gone on increasing ?—I do not think it has increased for the last six years.

54,276. How many boats is the largest number engaged in it that you remember ?—We have had 30, and now we have about 25.

54,277. Does that include all the boats on the Scotch and the English side ?—There are none who follow it from the English side now ; they engage in the salmon-fishing, and they think they can make a better job of it.

54,278. In your fishing has the catch of shrimps increased, or is it stationary, or is it diminishing ?—It is just as good at this present time as it was the first season we came.

54,279. Are the shrimps bringing a better price ?—No ; our price is always one. We never get more than threepence a quart. We have what we call a stated price the year round.

54,280. Is that the same every season ?—Yes.

54,281. When do you fish ?—We never give over unless the frost stops us.

54,282. Except for the frost you fish the whole year round ?—Yes, and fish for flounders also.

54,283. Over what extent of ground does your fishing extend ?—It extends over 20 miles.

54,284. But it is always within that part of the Solway from which the tide runs out and leaves a great deal of sand ?—We are always in the Channel.

54,285. But never in deep water ?—No ; there is no deep water in the Firth here, not for 40 miles.

54,286. Can you trawl all over the bottom ?—Yes, all over the sandy bottom unless we come upon the scars about Preeside ; but we keep off that as much as we can.

54,287. We have asked the flounder fishermen to tell us the value of their fishing and the quantity they catch. I presume you have a pretty good knowledge of the quantity you have taken, and the price having remained stationary you will be able to tell us the value. Has your catch remained pretty much the same ?—Yes.

54,288–9. What would be an average catch for two men in a boat for a day's work ?—One man and a boy would get from 80 to 100 quarts in a tide, and more than that at the present time.

54,290. Is the catch showing any signs of falling off ?—It has been better this week than it has been for 12 months.

54,291. Have you trawled over the same ground constantly ?—I was over the same ground a week ago.

54,292. Would you not pass over the same ground every day ?—Yes, sometimes.

54,293. And you always find shrimps ?—Yes, and they are every day getting better.

54,294. Does the trawling improve them ?—The trawling is improving because the season is improving. We had a bit of fine weather this back end. It was very well a short time ago, but we had some heavy freshes and they worsened then. Since then it has come fine weather and the shrimps are increasing.

54,295. Do you find the shrimps increasing ?—Yes, they are increasing now ; but fresh water in the back end and the spring of the year is sadly against us.

54,296. At the other seasons of the year how is it ?—In the summer time it does us good.

54,297. (*Mr. Lefevre.*) I suppose that you always find them in the brackish water ?—We always get them in the Channel.

54,298. But where the fresh water is mixed with the salt water ?—Yes.

54,299. (*Mr. Caird.*) You call the Channel where the tide always runs ?—Yes ; we go into five fathoms of water sometimes.

54,300. Do you trawl for shrimps in five fathoms of water ?—Yes, and in two or three fathoms sometimes.

54,301. How many hours in a tide can you trawl ?—About down to low water time.

54,302. What else do you catch in your shrimp-nets besides shrimps ?—We get small flounders sometimes.

54,303. Do you get any large quantity ?—Sometimes a large quantity.

54,304. Are they used for food ?—No, they are of no use at all.

54,305. What do you do with them ?—We throw them overboard.

54,306. Are they dead ?—They are as wick as ever they were.

54,307. You never see them turning up when they get in the water ?—We cannot help it if they do. Of course we must waste odd ones ; but it would be as

DUMFRIES.

R. Woodhouse.

29 Sept. 1864.

much to our benefit as that of anybody else not to get them.

54,308. You throw them overboard?—Yes, as soon as we can get the shrimps sorted from them.

54,309. What proportion of your whole trawl will sometimes be flounders?—I have seen sometimes when we have not had one, and other times we have had the bulk of a quart of flounders.

54,310. And how many quarts of shrimps at the same time?—Perhaps 20, 30, or 40 sometimes.

54,311. Have you not seen a larger proportion of flounders at times?—Yes; I have seen the trawl sometimes with so many flounders in it that I have emptied the tail of the trawl and shot them overboard as soon as I lifted the trawl.

54,312. Have you ever fished with a beam-trawl for flounders?—Yes.

54,313. With the same boat?—Yes.

54,314. Do you do that at a different season or at the same season?—That generally begins when it becomes hard weather. As soon as the frost begins we take to flounder-trawling.

54,315. Is the shrimping a more profitable business than flounder-trawling?—Yes.

54,316. You only take to flounders when the season or the weather does not permit you to fish for shrimps?—Yes; when the weather does not permit.

54,317. Is that the case with all the shrimpers?—Yes; unless it be some persons who have no market to send stuff of that sort to at a regular price. One of our parties started this trade. We had 18 stone on Monday, and if we had had a breeze of wind we might have doubled them.

54,318. Eighteen stone of flounders?—Yes.

54,319. Good flounders?—Yes.

54,320. Were they caught with the regular sized mesh?—Yes.

54,321. What is the size?—One and half inches.

54,322. Is that smaller than the other men use?—It is what we call the regular sole trawl.

54,323. Their mesh here is three and three quarters in the coil?—Yes.

54,324. What is yours?—An inch and a half from knot to knot.

54,325. And theirs is what?—They say they are fishing with a four-inch coil now.

54,326. They are beginning to do so?—Yes.

54,327. But three and three quarters is what they have used?—Yes.

54,328. Yours is an inch and a half from knot to knot?—Yes.

54,329. Theirs would be two inches between knot and knot?—Yes; ours would be half an inch less; but I measured four peedle-nets on Tuesday last, and they were only an inch and a quarter.

54,330. Are they stake-nets?—Yes, I measured four of them and they were only an inch and a quarter.

54,331. Is there no regulation among yourselves as to the size of your mesh?—No, there is not, but we ought to have a regulation.

54,332. Does every man use what he pleases?—Yes.

54,333. Does anybody come to see what the size of your mesh is?—Nobody; nobody ever comes to interfere.

54,334. Would you like to have some interference?—Yes, for flounder-trawls I should like to have a fresh mesh put in.

54,335. What mesh do you think would be a proper one?—Two-inch coil; that would be better for everyone.

54,336. You desire to have that for the beam-trawls too?—Yes.

54,337. (*Mr. Lefevre.*) Two inches from knot to knot?—Yes, that would be four inches round the coil.

54,338. (*Mr. Caird.*) That would be the same size as the mesh which the stake-net fishermen are desirous of adopting?—They say so.

54,339. Do you know whether the men who trawl for flounders make a good business of it on the whole?—It all depends on the season of the year. There is a very good prospect for flounders this season, because BrewingScar is all covered over with young mussels, which has not been the case for six years before.

54,340. Have you found any other banks on which to trawl for flounders where you could make a good catch this year?—We got 18 stone on Monday, and with a good breeze of wind we might have doubled it.

54,341. What is that compared with last year and the year before?—The catches were very thin then, on account of the scars being sandy.

54,342. Has flounder-fishing fallen off?—Yes.

54,343. On account of the scars not being well covered with mussels?—Yes.

54,344. Has anything been done to the scars to render them less productive of mussels?—No; but the sand gets on them and chokes the mussels, and the fry of the young mussels cannot get there.

54,345. Then that is according to the weather and tides?—If the scars are bare and keep clean they will get covered with "freer" directly.

54,346. Is that the spat of the mussels?—Yes; if there be plenty of that "freer" there will be plenty of flukes.

54,347. Does that vary in different seasons?—Yes, it depends on how the channels work and run up.

54,348. (*Mr. Lefevre.*) What is the nature of the soil of the scar?—It is stone. It is about 30 years ago since we came into this country and from Preeside then they could not get a fluke. And what was the cause of that? It was because the scars were sanded up and they were obliged to go over to Cardornock to fish there. The sanding up of the scars was the cause of it.

54,349. Is it within your knowledge that 30 years ago there was as bad a flounder fishery as there is now?—Yes, and I have been told that the Preeside men went across to fish.

54,350. Is there any witness here whose experience goes as far back as that?—The man from whom I had that is not here, but he told us that he was for some time going from Preeside to Cardornock to fish for flounders, and that was all on account of the scars being bare.

54,351. You say that the scars this year present an appearance favourable to good flounder-fishing?—Yes, they do, and it will be a good flounder-fishing.

54,352. Then in your opinion it is not the mode of fishing that has injured the flounder-fishing, but the want of food for flounders?—Yes, just the want of food.

54,353. You heard the suggestions made by the previous witnesses as to putting a stop during certain months,—during the spawning months if they could be ascertained,—to shrimping altogether?—Yes.

54,354. Have you anything to offer with regard to that?—No.

54,355. Do you think it would be a proper thing to do?—They might make a close-time, but the frost makes a close-time itself, and that is the best time for the flukes.

54,356. Does the flounder-fishing improve during the frost?—That is the time when we get the most little flounders. The frost drives all the small flounders into the Channel, and then that is the time they come to us. We get them by trawling.

54,357. What would your close-time be then?—I should say three months in the winter.

54,358. You should not be allowed to shrimp at all during three months?—We could do with that.

54,359. What would you do then?—Fish for flounders.

54,360. Let me hear the three months?—From the last of October until the beginning of February.

54,361. At that time are the shrimps not as plentiful?—Yes. I have seen them as good in the winter as ever they were in the summer. I have seen them very good after Christmas.

54,362. But you would be willing to forego fishing for shrimps during that time?—Yes.

54,363. You would give over shrimping during those three months with a view to improving the flounder-fishing?—Yes.

54,364. Do you think that would be generally agreed to on the part of the shrimpers?—Yes.

54,365. Is there any particular season of the year when the shrimp market is better than at other seasons?—No.

54,366. Is there a demand in large towns for shrimps all the year round?—Yes.

54,367. If that system were adopted generally through the country what would happen to the people who eat shrimps?—They would like them better when they began to eat them again.

54,368. How many shrimpers take to flounder-fishing in the winter months?—Perhaps there may be six or eight boats going to it.

54,369. Not more than that?—It may happen that sometimes all of them will be going if it be a hard frost. In that case they have all to take to that job.

54,370. How do they do if the winter is moderate?—Some are shrimp-trawling, and some will be flounder-trawling.

54,371. Have you taken to flounder-fishing already this year?—No, not myself, but a friend of mine has.

54,372. How will it be supposing the weather keeps moderate?—If the weather is mild all the winter we should still stick to shrimp-trawling.

54,373. In the mild winters do you catch as many flounders as in the cold ones?—It all depends on the food. If there is no food we may as well do nothing.

54,374. Are all the boats provided with beam-trawls for flounders?—Yes.

54,375. What is the length of the beam?—The largest are 24 feet.

54,376. What is the length of the net?—It is put upon a 24-feet beam, and it may go 30 feet long in the tail.

54,377. Is it not more than that from the beam to the tail of the net?—No.

54,378. Is the mesh smaller towards the end?—No, it is all of a size.

54,379. There is a bag I suppose?—Yes.

54,380. Is not the mesh there smaller?—No, there is no difference in a flounder-trawl.

54,381. Do you use the trawl-nets for shrimps?—Yes.

54,382. What is the length of the beam?—From 22 to 23 feet.

54,383. Is there one at each side?—Yes, one at each side. When we go broadside end down with the tide and wind we use both of them.

54,384. Do you take any small fish beside flounders?—No.

54,385. Do you take any young cod?—No. I have followed this business for 30 years, and I have not seen 30 small cod in the trawl since I started.

54,386. Or herrings?—Catching herrings and shrimps and trawling for flounders are what I have done.

54,387. Do you take small herrings?—I may light on an odd one sometimes, but there are very few herrings that breed here.

54,388. Do you take haddock?—I never saw a haddock in my life, only in a trawl-net out in deep water.

54,389. You take no small fish except flounders?—There are a good deal of small fish that are never used for food, such as crab-fish, toad-fish, and those things which no man dare touch, let alone eat.

54,390. But with the exception of those fish you take nothing but flounders?—Only flounders.

54,391. Do you ever take the small flounders ashore?—There may be some go ashore, but what these men are speaking about is some flounders which we used to send to Liverpool. If it came on bad weather we used to put them on board a vessel that was accustomed to run from Annan Foot to Silloth to meet the Liverpool boat. If they could not go in that way they were thrown overboard and wasted.

54,392. Were you in the habit occasionally of selling small flounders?—No. What we sent away was what we got with the flounder-trawl.

54,393. But what do you do with the small flounders you take up in the shrimp-trawl?—We throw them overboard.

54,394. Do you not take them ashore?—We might take an odd one or two, but our shrimps are generally clean and fit for the market when we take them ashore.

54,395. Are the small flounders alive when you throw them overboard?—There may be a few odd ones dead, but we waste as little as possible.

54,396. Do you send the flounders you take to Liverpool or to Dumfries?—We have sent to Dumfries, but the most part of them go to Liverpool and Carlisle.

54,397. Along with the shrimps?—No; we get them at the time we are not getting shrimps.

54,398. Do you send shrimps to Liverpool also?—No, very little to Liverpool. We send them to Birmingham, Manchester, and London.

54,399. Do they go through Liverpool?—No.

54,400. Where do you send them from?—Right through.

54,401. From what station?—Annan.

54,402-3. I suppose, if you were restricted to using the hand trawl for shrimps, you could not trawl in deep water?—I do not suppose there ever was one used in this country.

54,404. Is there any fishing with the hand trawl here?—Not here. They use both hand-trawling and boat-trawling with us in our country, but there is none on this side.

54,405. Is it possible to carry out hand-trawling here?—We might get some sometimes, but very few.

54,406. Do you trawl in deep water?—Right in the Channel. We are never in less than from eight to 10 and 12 feet of water.

54,407. Then it would not be possible to fish upon the same ground with a hand-trawl?—It would be impossible for a man to wade through the water.

54,408. What is the value of a boat and its gear?—From 80*l.* to 90*l.*

54,409. Do most of the fishermen own boats?—The biggest part of them do.

54,410. (*Mr. Caird.*) Have you ever observed the flounder stake-net fishing?—Yes.

54,411. Have you noticed the take of fish in it?—Yes. I was in Brewing on Tuesday.

54,412. Did you see small flounders in it?—Yes, I saw all sorts.

54,413. Were there any so small as not to be fit for the market?—I do not know if they were fit for the market or not. There were big flounders lying dead, about a pound weight. They had never been to look at the nets for four or five days, and the fish were fairly rotten. The net I speak of was placed on a little island, and they could not get at the fish in it without boats, and they have no boats, so that they cannot get at these nets except in the spring tides. There was one net at Brewing which had fish in it for eight or ten days. There were eight or ten stone of flounders in it; I saw it myself.

54,414. Were they all lost?—Yes, they were all wasted.

54,415. Do their nets go dry at low water—most of them?—Those had been dry twice every day.

54,416. Do most of the nets go dry at low water?—Not at neap tides. At neap tides they cannot get at them, but they put them there at spring tides.

54,417. Having observed that fishing by stake-nets, do you think that beam-trawling for flounders catches the most fish?—We can catch as many again as they can.

54,418. Have you noticed both fishing at the same time in the same piece of water; have you noticed that you can make a larger fishing by the beam-trawl than they can by their stake-nets?—We can if the

DUMFRIES.

R. Woodhouse.

29 Sept. 1864.

fish are in the Channel. If the scars are all clear and covered with mussels so that the flounders can get on them to feed at low water we can get more by one-half than they can.

54,419. By which of the two modes of fishing are the most flounders sent to the general market?—Out of 20 boats we could find two that would send more than all they send altogether.

54,420. Who does send most?—We do when we are at work.

54,421. For the year round do you send more flounders to the market than the stake-net fishermen?—Yes, in three months of the winter we send more than they send all the year round.

54,422. And you have the shrimps besides?—Yes, for eight or nine months.

54,423. Do you ever get spawn in your nets?—No.

54,424. No spawn of any description?—No, not in the Channel. It is impossible for fish to spawn in the Channel with the tide running eight and ten knots an hour.

54,425. Did you never see spawn here?—No.

54,426. Then you do not think the fish spawn here?—No, I never saw spawn nearer than Bahama Bank.

54,427. Where is that?—Nine miles on this side of the Isle of Man; and I have had my trawls fast in it there.

54,428. What kind of spawn?—Herring spawn.

54,429. Did you know it to be herring spawn?—Yes.

54,430. Did you bring it up?—No; but the ground was full of it.

54,431. Did you bring it up?—We had to shake it off; we could not bring it up.

54,432. Are you quite sure it was herring spawn?—They said it was herring spawn.

54,433. You yourself did not know it to be herring spawn?—No.

54,434. (*Mr. Lefevre.*) What time of the year do you think the flounders spawn?—I cannot tell, but I think they spawn in the summer.

54,435. Do you agree with Burnie, who told us that the flounders lose strength in November and December, and are not so good then?—I do not know.

54,436. November, December, and January are the months in which you take to flounder-fishing?—In those months, or rather in next month and the month after, the flounders are about at their best.

54,437. About the strongest?—Yes, and frosty weather takes them off again. There is no fear of their spawning in winter.

54,438. Then you do not agree with Burnie that the flounders are not so good in November and December?—They are good now.

54,439. And in November and December?—Yes; the hard weather in the winter time makes the flounders go into the Channel. They do not spawn there. I think they spawn in the summer, and after Whitsuntide they get themselves up again.

54,440. What time do you find the shrimps spawning?—At all times.

54,441. Is there any time of the year when you observe them not spawning?—No; we cannot tell when shrimps spawn, and no man can. I have followed them for 30 years, and I do not know.

54,442. (*Mr. Caird.*) Does the frost affect the mussel beds at all?—No.

54,443. It does no injury to the mussels?—No.

54,444. Are the mussel banks generally dry at low water?—Yes, some of them; but they set in the Channel as well as they do, high and dry.

54,445. Does not the frost kill the mussels?—It will kill cockles, but not mussels.

54,446. (*Mr. Lefevre.*) Have you observed the supply of shrimps to be the same year after year, or does it vary?—It varies. It all depends on the season. If there comes a dry season it rather hurts us, but if the weather suits the supply is good. They are as good now as they were the first year we came.

54,447. When you first came what was the number of trawlers?—The first year we came there were only about five of us, I think; the year after there were 21 or 22.

54,448. You told us there are 25 now?—They increased until they got as far as 30, and there are 25 now.

54,449. The second year there were 21?—Yes, or 22.

54,450. Then they increased gradually until they got to 30?—Yes.

54,451. And then they fell off to 25?—Yes; there are 25 now.

54,452-3. And on the whole do you make as good earnings now as you did then?—Yes.

54,454. (*Mr. Caird.*) Which of the two kinds of fish yield on the whole the largest amount of money to the fishermen, the flounders or the shrimps?—You could not get a quantity of flounders that would make as much money as the shrimps in all Scotland.

54,455. Do you make as much money by the shrimps as you could possibly get if you could supply all Scotland with flounders?—Yes.

54,456. I mean in the flounder-fishing in the Solway within the bounds in which you fish?—Yes.

54,457. Is the shrimp-fishing so very much more productive than the flounder-fishing?—Yes.

54,458. Then it would be a greater hardship to you to be deprived of the shrimp-fishing than the flounder-fishing?—Yes, I think it would be a great deal.

54,459. Can you give us an idea of the amount of money got by shrimp-fishing in a season?—I could make a bit of a guess.

54,460. What is it?—The tackle that we use is very expensive. I think we may distribute about 2,000*l.* a year in Annan.

54,461. From shrimps?—Yes.

54,462. (*Mr. Lefevre.*) How much do you make by the flounders?—Not one-tenth part of it.

54,463. (*Mr. Caird.*) You are quite accurate in your statement, and are making it with a full consideration of what you are saying?—Yes; I have paid as much as 150*l.* a month for carriage upon the railway.

54,464. Do you know what you have paid for the carriage of flounders?—We never paid much for the carriage of flounders. When we followed it we had a boat running from Annan Water Foot to Liverpool.

54,465. Then there is no test by railway carriage by which the two can be compared?—No.

54,466. (*Mr. Lefevre.*) If the weather remains mild throughout the winter could you continue shrimp-fishing?—Yes.

54,467. Or take to flounders?—If the weather continues mild, and no frost, we still follow shrimping.

54,468. Do you find the shrimps plentiful all through the winter?—Yes, all the year round.

54,469. If there is mild weather, are they as plentiful as in the summer?—Yes.

54,470. (*Mr. Caird.*) Are the shrimpers mostly Englishmen?—All of us except those we engage at Annan.

54,471. Are the shrimpers generally strangers in the district?—Yes, all are strangers who come from Lancashire. We fished in Morecambe Bay before we came here.

54,472. Are there no native shrimpers here?—There are a few whom we have taught.

54,473. Are they in the same fleet with you?—Yes.

54,474. Are they Scotchmen?—Yes.

54,475. Do they find it pay as well as you?—No, they have not the same idea of it, and they do not get as many fish; we cannot learn some of them; it is not in them as it is in us, that is the long and the short of it.

54,476. (*Mr. Lefevre.*) How many men are there in a boat?—Some have only one man; some one man and a boy, and some two men.

The witness withdrew.

THOMAS HOUGHTON called and examined.

54,477. (*Mr. Caird.*) You are a Lancashire man?—Yes.

54,478. You are a shrimp fisher?—Yes.

54,479. And also a flounder fisher with the beam-trawl?—Yes.

54,480. You have lately taken to flounder-fishing?—I commenced flounder-fishing on Monday.

54,481. Do you find it as profitable as shrimping?—I started on Monday, and we had very little wind, but I caught 18 stones of fish before the tide was over.

54,482. What do you sell the flounders at per stone?—1*s.* a stone.

54,483. How many men are there in a boat?—Two for flounder catching.

54,484. So that you made 18*s.* of flounders in one tide?—Yes.

54,485. Is that a common thing for you to do?—It depends upon the wind. If there is a fine breeze we can make as much in a tide as we can make in a week without any wind.

54,486. Have you been fishing flounders in successive years for some time past?—I have been for eight years.

54,487. Is the catch of flounders increasing or diminishing?—It depends in a great measure upon the tide.

54,488. Have you found the catch increasing or diminishing within the last eight years?—The last year's fishing was a poor fishing, but this year we have had a very good year.

54,489. Then the fishing this year looks as well as it has ever been?—It has been better than for many years.

54,490. You expect to make a better fishing this year than you have been in the habit of making for some time back?—Yes.

54,491. You do not agree with the statement made to us that the flounder-fishing has been destroyed?—No; they blame us for destroying it, but we can get as many as ever we did. We catch shrimps and flounders, and when we are catching both shrimps and flounders it is very seldom that we see them at work.

54,492. Do you not fish in such shallow water?—We are sometimes in deep water and sometimes by the side in more shallow water, but they are further up the bay.

54,493. Do you fish for flounders in the same part of the bay as the stake-nets are set for catching them?—We come as near to the stake-nets as we can sometimes. Occasionally we might jump into them from our boats as we pass.

54,494. Is your mode of fishing a better mode of catching the fish than the stake-nets?—The stake-net fishermen set their nets at low water in spring tides, and they cannot get at them for three or four days, whereas with our mode of fishing what fish we catch we send right away to the market.

54,495. Are there many boats engaged in flounder catching?—There have only been 10 this season.

54,496. Where do you send your flounders to?—To Carlisle.

54,497. Do you send as many as the stake-net fishermen do to the market?—We send as many as the market will take, and we send the rest to Liverpool.

54,498. But do you catch and send as many to the market altogether as the stake-net men do?—Sometimes they take a good deal, and sometimes not many.

54,499. Do they catch small flounders?—I have seen a deal of small flounders for sale in Annan when they come in that way to sell them.

54,500. Do you catch many small flounders?—Sometimes we catch a good many, but we fish up what is marketable, and put the rest into the sea again if we cannot get them to Liverpool.

54,501. Are they alive when you throw them out?—Some of them are and some of them are not.

54,502. What is the size of the mesh of your net?—I cannot rightly say what the size of the mesh is.

54,503. Have you no regulation as to the size of the mesh?—No, none at all.

54,504. Do you make it as it suits you?—We make it about what we think the right size for catching.

54,505. You have no wish to catch small fish?—No, they are of no use.

54,506. You would rather avoid it if you could?—Yes, a good bit. A large mesh will catch a less quantity of small fish and will involve less work.

54,507. Less work?—Yes, there is no trouble in getting the fish into the boat, and you don't pull your nets to pieces with them.

54,508. Have you been shrimp-fishing this year?—I have been shrimp-fishing since I was 14 years of age, and I am now 43.

54,509. Do you use the same boat for shrimping as for flounder-fishing?—Yes.

54,510. What mode of fishing brings you most money for the same labour?—There is not as much expense in flounder-fishing as in shrimp-catching; we have 5*s.* per cwt. to pay for railway carriage, and there is a much nearer market than ours for shrimps in Morecambe Bay, which renders it difficult for us to compete with them.

54,511. The quality of the shrimps I suppose is much alike?—Yes.

54,512. But they have less railway carriage to pay at Morecambe?—Yes, we have our markets to find in England; our general markets are Birmingham and London, but if we send small shrimps they are of no use.

54,513. (*Mr. Lefevre.*) Do they send shrimps to London from Morecambe Bay?—Yes.

54,514. Do you also?—Yes.

54,515. You have the command of the same markets that the other men have who fish in the Solway?—Yes, some of them send in one way and some in another; some send to particular merchants and others on commission; sometimes we do very well, and sometimes very badly. When the shrimps come thick at this time of the year we get nothing for them after paying the railway carriage and the charge of the commission dealer, and we frequently have many returned, and then we get next to nothing.

54,516. (*Mr. Caird.*) When that time comes what do you do?—We turn to another trade.

54,517. And when you find the shrimps rising in price you go back?—Yes, sometimes we change twice a week if we can make more money by it. With regard to those stake-net men, although each of those men professes to be a fisherman he is only at it for three months in the year. The remainder of the year they spend some in farming and some in weaving, whereas we are fishermen all the year round; if we don't fish we do nothing.

54,517*a*. (*Mr. Lefevre.*) Did you come from Morecambe Bay?—Yes.

54,518. Did you come here because the fish had fallen off in Morecambe Bay?—We came here herring-fishing.

54,519. What made you stop here?—Some came to try for shrimps, and thinking it was a nice place stopped here. The shrimps were larger than those we had and it was thought they would take better in the market.

54,520. Was the supply falling off at Morecambe?—No, I don't suppose it was.

54,521. Are there as many boats fishing there now as there used to be?—There are a good many more than there were; on and off there will be 100 boats fishing there.

54,522. Do you agree with the last witness that the enforcement of a close-time for shrimps would be of no detriment to the fishermen here?—We could turn to another business altogether, fluke-fishing.

54,523. Would you object to be prohibited from fishing for three months?—I am willing to do the same as my neighbours.

DUMFRIES.

T. Houghton.

29 Sept. 1864.

54,524. What effect would it have on the fishermen if you were not allowed to fish during the three winter months?—If there was hard frost it would have no effect at all, but if it was an open winter and we had mild weather we might get out perhaps for a tide and make a week's work, although sometimes we might not be out for a fortnight.

54,525. If there was an open winter and you were not allowed to fish for three months, namely, November, December, and January, would it tell hardly on the fishermen?—We could take our boats to Wigton Bay and Whitehaven and fish oysters. We could fish between here and Liverpool down to the Liverpool Channel foot, and wherever we could get the best earnings and find the best market.

54,526. Have you been in the habit of turning to other modes of fishing besides shrimping and flounder catching?—Yes, I have been herring-fishing two or three times in my life.

54,527. Where do you find herrings?—Off Maryport, Whitehaven, and off Preeside.

54,528. What is the season for that?—The winter season, but I have not fished for the last two winters. I last fished off Nelson's Bay and in Liverpool Channel.

54,529. Since you have been at Annan have you known herrings come up the Solway?—I have known them come up to the Solway before I came to Annan. It is now a dozen years since they reached Maryport, but they never came as far as this.

54,530. Do all the shrimpers go after them?—Yes, the great body of the fishermen will fish for herrings if they can catch them.

54,531. Do you fish for oysters?—Yes, we have occasionally fished for oysters in Wigton Bay and Whitehaven.

54,532. Are there a great many boats fishing for them there?—Yes, in the winter season.

54,533. (*Mr. Caird.*) Have you fished the oyster beds in Wigton Bay?—Not personally; but there were some boats from Fleetwood last year that did fish there. They did very well I believe.

54,534. Have the beds been fished out there?—No, they have not fished out the beds there; they always leave the young.

54,535. (*Mr. Lefevre.*) Do any of the large class of trawlers fish towards the entrance of the Solway?—They come in as far as Workington. They are heavy boats from Whitehaven, Fleetwood, and Liverpool.

54,536. Are there many boats at Whitehaven?—About half a dozen.

54,537. What size are they?—About 30 or 40 tons. There are larger boats at Fleetwood.

The witness withdrew.

R. Woodhouse.

RICHARD WOODHOUSE recalled and examined.

54,538. (*Mr. Caird.*) You are well acquainted with the shrimping in Morecambe Bay?—Yes.

54,539. Do you think the Morecambe Bay fishermen would agree to a close-time?—I think it is likely they would.

54,540. Have they any other kind of fishing which they could follow?—They mostly follow catching mussels in the winter season.

54,541. (*Mr. Lefevre.*) Do you think that a close-time during the months of November, December, and January would improve the flounder-fishing?—I cannot tell.

54,542. Do you think you take so many small flounders when you are shrimping that it affects the flounder-fishing?—At the time of the year when we take them we throw them overboard as quickly as possible. It is cold weather, and they would live if we kept them for three or four days. Anybody knows how long a flounder will live.

54,543. Then do I understand that you think a close-time for shrimps would be of no real benefit to the flounder-fishing?—I don't know; I cannot tell.

54,544. What you mean is that the enforcement of a close-time as regards shrimps during these months would do no harm?—It would do no harm to the shrimps.

54,544*a*. (*Mr. Caird.*) Where do the fry come from?—When it is fine open weather the young fry of the flukes are lying on the edges of the banks out of the tideway, close in by the sides of the sand banks. As soon as ever it comes on frosty weather, and we have two or three frosty nights, they are driven away into the deep water. They make for the deep water, and at the close of a week's frost we do not see any more of them.

The witness withdrew.

J. Holmes.

JOHN HOLMES called and examined.

54,545. (*Mr. Caird.*) You are a shrimp fisher on the Solway?—Yes.

54,546. You have been so for some years?—Yes, since I was 10 years old.

54,547. You desire to make a statement to us as to the possibility of destroying spawn where you fish?—Yes.

54,548. What is it?—I think that every mesh should be four inches. They should be knit on a coil of four inches, but at present they use any kind of mesh, large or small.

54,549. Would that mesh be two inches from knot to knot?—Yes, and it would prevent us from taking as many of the little flounders as we do.

54,550. How would it be with regard to the spawn?—We cannot get any of the spawn of the fish because our boats draw five or six feet of water, and we cannot go near the banks where the spawn is. There are plenty of boats at Annan Water Foot which draw five and six feet of water, but the ova are deposited on the banks.

54,551. (*Mr. Lefevre.*) Do you mean spawn or small fry?—Spawn.

54,552. As you always trawl in the tide you cannot disturb the spawn that is laid in the still water?—No, we cannot; it is simply the fry we can disturb.

54,553. (*Mr. Caird.*) Where have you seen spawn?—I have seen plenty of spawn on the bank.

54,554. On the scars?—No; on the Brashay bank and various other banks.

54,555. Is it the spawn of the flounder?—Yes.

54,556. Is there any spawn of the flounder in the upper part of the Solway?—Yes, on the banks.

54,557. How far down are the banks you mention?—Four or five miles down from Annan Water Foot.

54,558. Do you not trawl on those banks?—No, we cannot get near them.

54,559. Are there any nets set on the banks?—Not on the English side down as far as that.

54,560. Are none of those poke nets which have been described to us set on those banks?—No.

54,561. There are no nets that would destroy the spawn?—No.

54,562. Are there any spawning banks on this side?—Yes, plenty. The Brashay banks are on the Scotch side. I don't think there are any stake-nets on the English side.

54,563. Have you not seen any mode of fishing carried on on these spawning banks that would be destructive of the spawn?—No.

54,564. (*Mr. Lefevre.*) With regard to the mesh, you would recommend a 4-inch coil?—Yes, two inches from knot to knot.

54,565. Why have the fishermen not already adopted that if they think it would be of advantage?

—I cannot say. I think that one has been waiting for another.

54,566. Why do you not use it yourself?—Some think that they can get a greater bulk of stuff, and that they can take the little flukes they catch to the market. In that way one encroaches upon another until they all do the same thing. It would be of no use having any regulation unless we were all compelled to abide by it. There has been a great deal of uneasiness with regard to us fishermen since we came here, but we are willing to adopt any alteration in our mesh that may be considered desirable.

DUMFRIES
J. Holmes.
29 Sept. 1864.

54,567. Are you able to dispose of all the flounders you take in your net; have you always sold them?—Yes, we have sold them in England, but not in Scotland.

54,568. Have you taken any considerable number of small fish in your trawl?—Not many. We always sort them, and throw the little ones out. Those that are fit for the market we put in the boats and land ashore, and all the others are thrown away.

The witness withdrew, and the inquiry was adjourned until the 30th of September, at Morecambe.

Morecambe, Lancashire, Friday, 30th September 1864.

PRESENT:

J. CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

MORECAMBE.
J. Bell.
30 Sept. 1864.

JAMES BELL called and examined.

54,569. (*Mr. Caird.*) You have long been acquainted with the fishing in Morecambe bay?—Yes.

54,570. Has it altered its character at all within your recollection; have the same descriptions of fish been fished all the time you recollect the fishing?—Yes, the fishing has been the same as it always was, for anything I know.

54,571. What is the fishing?—There are all sorts of fishing. Trawling for shrimps, and trawling for flukes. There is not very much trawling for flukes, but it is carried on to a small extent; trawling for shrimps has greatly increased. There are 100 times as many got now as there were at one time in my recollection; I can recollect when there were only eight or nine boats following the trawling for shrimps.

54,572. What may be the number of boats now?—I should say there are 150 at least.

54,573. (*Mr. Lefevre.*) How long ago is it since there were only eight or nine boats?—Fifty years ago.

54,574. (*Mr. Caird.*) Have they gone on gradually increasing?—Yes, more have been got every year.

54,575. Are the boats of larger size than those you formerly used?—Yes, a deal larger.

54,576. Do they carry a larger description of nets?—Yes, larger in proportion in width.

54,577. Does one boat carry two nets?—Yes.

54,578. One on the bow and one on the stern?—Yes; but when I can first recollect they only carried one.

54,579. So that each boat carries double the number now?—Yes.

54,580. How many men are there in each boat; is there a man and a boy or two men?—One man sometimes, and sometimes two.

54,581. Can a man and a boy fish a boat with a mast and a sail?—Yes.

54,582. Is the boat sailing, while they are trawling?—Yes, if the wind suits. The sail would aid him in shifting up the bay.

54,583. What would you consider a fair catch of shrimps, for a man and a boy working all the day, 20 or 40 years ago?—Twenty years ago from 20 to 30 quarts were reckoned a good catch for a tide. Sometimes they would get more and sometimes less.

54,584. What do you consider a fair catch now?—I should say that 30 quarts are a good catch now.

54,585. Then there has no been much change in the quantity caught by each boat?—Not by each boat. There is sometimes more caught and sometimes less. Sometimes they catch as much as half a cart-load.

54,586. I presume that it varies according to the state of the weather?—Yes, according to the state of the weather and the tides.

54,587. But on the whole there has been a very large increase in the quantity of shrimps got, compared with what it was 20 years ago?—Yes, there are a great deal more got now.

54,588. Has that increase been going on year by year?—Yes.

54,589. Is it showing any sign of diminution now?—No, it regularly increases, because there are more people at it.

54,590. Have you always fished during the length of time you mention in the same channels, and upon the same grounds?—Yes, they follow the same channels.

54,591. The channels which have been so long fished do not show any sign of giving way in producing fish?—Sometimes the fish get thin in one particular channel, and then they go to another; perhaps they go a bit further off. They go as far as Ulverston Channel.

54,592. But by changing they always succeed in finding plenty of shrimps?—Yes.

54,593. Has the price of shrimps altered during the last 20 years?—It has never altered that I know of. It has always been 3*d.* or 4*d.* a quart.

54,594. Are the shrimps sold here?—They are sent away.

54,595. Do the merchants here buy them?—Some are sent to fish salesmen at Manchester and Liverpool.

54,596. Does the price always continue the same?—They do not get as much there sometimes, and they are sold sometimes for a little more; but the average price will be as near as can be 3*d.* a quart.

54,597. What are the circumstances that make the fishing sometimes vary; are they weather and tide?—Hot weather is sadly against the shrimps.

54,598. Hot summer weather?—Yes, I never saw many shrimps then.

54,599. Are the shrimps fished the whole year round?—Nearly so, without there comes a hard frost.

54,600. There is no particular season for shrimps?—No, but the best season is in the spring of the year. There are most caught for about three months in the spring.

54,601. The hot weather is bad for them?—Yes.

54,602. Is frost bad for them?—Yes, they go then into deeper water, and they work themselves overhead in the sands to save themselves.

54,603. Do you imagine it would be any advantage to have a close-time during which shrimps should not be fished?—Not a bit.

54,604. One reason you assign for that is that shrimps are constantly increasing in quantity?—I think the shrimps are mostly destroyed in the hot weather. There are little bits of sand edges left by the tide. The tide runs hard on those banks, and leaves ridges that will hold about a table-spoonful of water. The young brood of all kinds stop in these little bits of crevices, and when the weather comes very hot the water completely dries, and leaves them lying dead on the sand. There are a hundred thou-

MORECAMBE.

J. Bell.

30 Sept. 1864.

sand times more destroyed in that way than in any other way.

54,605. Nothing can prevent that?—I have seen them rolling up as far as the eye could follow them. I have seen a roll of the small fry going on the banks just as the tide took them; you would be surprised to see the quantity destroyed in that way.

54,606. There is a large quantity of dead fish left in that way?—Yes; there is an enormous quantity of small tiny things just shaped that are left dead.

54,607. They are left dry by the evaporation of the water?—Yes.

54,608. (*Mr. Lefevre.*) What are they?—There are all kinds of fish, but chiefly shrimps and little flukes.

54,609. Do you think there are any small soles?—Yes; there are small soles among them. There are small fish of every kind.

54,610. What other kinds?—They will be chiefly flukes and shrimps I think. The flukes leave their spawn in the water, and it floats about and stops in these little bits of crevices, and when they are left dry they are killed at once.

54,611. Do you ever see any young herrings or haddock or cod among them?—No.

54,612. (*Mr. Caird.*) Has frosty weather the same effect upon the young fry which are left on the sands when the tide goes out?—They go into deeper water as the weather becomes colder.

54,613. Do they not come as much into shallow water?—No.

54,614. Then there is not as much damage done by the frost as by the hot weather?—No.

54,615. In the process of dragging for shrimps, is there any large quantity of small fry destroyed?—Yes.

54,615*a*. What kind of fish is it?—It is principally little flukes. There are also what they call pile heads and toad-fish.

54,616. Are there any young soles?—At chance times there are; but not as often as flukes and such like.

54,617. Are such flukes and soles too small to be of any use for food?—Some of them are; but they do catch a few that are fit for food. There are very few, however, that are of use.

54,618. What do they do with them; do they bring them all ashore along with the shrimps?—They have a small basket. They empty the shrimps from the net into it, and while the boat is dragging the trawl they occupy themselves in dressing the shrimps with their hands. They throw overboard any dirt, and anything that is not fit for the market.

54,619.—Are the small fish thrown overboard alive?—Yes.

54,620. Do you think there is not much destruction of the brood of fish in that way?—There will be part destroyed; but the destruction done is nothing to be compared with the quantity of small fish destroyed in the hot weather.

54,621. (*Mr. Lefevre.*) Do they bring the small fish you speak of ashore?—They bring part of it ashore; they cannot avoid that.

54,622. But they throw a good deal overboard on the spot?—Yes.

54,623. (*Mr. Caird.*) You say you remember the state of the fishing many years back; do you remember the time when there was a much larger take of soles and flounders than at present?—Yes.

54,624. When was that?—The channel makes a deal of difference here. We had a channel up to the side here at one time, and it cleared all the loose ground, rough stones, and everything of that kind away, so that there is less hold now for the fish than when there were more stones. Here the stones used to be covered over with mussels, which formed food for those fish.

54,625. Food for flat-fish?—Yes.

54,626. Is it a fact that at any previous time there was a much better fishing for soles and flounders than there is now?—There never was a much better fishing for soles than there is now; but for flounders there were more here when the channel went up by the side. They follow the channel more.

54,627. There was a better fishing for flounders some years ago than there is now?—Yes, but it is a good many years since.

54,628. Are there many flounders caught here?—Not many.

54,629. Do the same fishermen who fish for shrimps catch flounders?—Not at the same time.

54,630. But do they take to flounder-fishing occasionally?—Yes.

54,631. They trawl for them also, do they not?—Yes, a few of them.

54,632. Which of the two modes of fishing pays best?—I do not know, but I should think shrimping.

54,633. You think that shrimping brings most money to the fishermen?—Yes; a hundred times more than anything else.

54,634. Has shrimping been always the most profitable fishing for the fishermen as long as you remember Morecambe Bay?—No; it was not so much followed many years ago. There were only 10 boats then.

54,635. Was the bay not as good for shrimps then?—There was no market. The railroad coming here, and opening a market, have made a great difference. Of course there could not be as many shrimps when there were only eight or ten boats.

54,636. Was there a larger proportion of flounders caught then than now?—Yes; I think there was.

54,637. The people went more into that fishing?—Yes; but then they fished at the side of the bay. They set stakes and hurdles.

54,638. Those stake-nets are set still to some extent for flounders?—Yes; but there are not so many of them now.

54,639. Did the stake-nets or the trawl-nets do best for catching flounders?—The stake-net would catch more than a hurdle.

54,640. Did they?—Yes; the net will catch more than a hurdle.

54,641. Do you mean trawl-nets?—No; a set net set on those stakes.

54,642. What are the hurdles you speak of?—They are set like an A, with a centre for a poke.

54,643. The question I put to you just now was this; do the stake-nets or the trawl-nets catch most; which of the two is the one in which the greatest number of flounders can be caught?—They can catch them very well with the trawl-net, if they happen to be among them.

54,644. Before we leave the shell-fishing, are there any oysters in the bay?—No.

54,645. Have there never been any oysters in the bay within your recollection?—No; never.

54,646. Are the mussel-beds very valuable?—Yes.

54,647. Are they very extensive?—Yes.

54,648. Do many of the fishermen follow the mussel-fishing?—Yes, in the winter time.

54,649. Is it in one particular season that the mussels are fished?—There is only a particular season. They are fished in every month that has an "r" in it.

54,650. The same as the oysters?—Yes.

54,651. Has that fishing long been practised here?—Ever since I can recollect.

54,652. Is it increasing?—There are more being caught now; but there were not as many people following it formerly.

54,653. Is it a fact that there are more being caught now?—Yes; there are now a hundred for one engaged in it with their boats.

54,654. Are they a different class of fishermen from the shrimp fishermen?—Some of them are the same. Perhaps they will do both jobs on the same day.

54,655. Just as they think they can pay themselves best?—Yes; they go up the channel with the flood tide after shrimps, and they come down at half ebb, and leave their shrimps and go out to take mussels. They fish in the last quarter ebb and the first quarter flood.

54,656. May we take it that the same people and the same boats that fish for shrimps fish for mussels?—Yes, the same follow both.

54,657. Do those who follow shrimp-fishing most make the best living out of it?—It is difficult to tell which does best.

54,658. You say that the quantity of mussels taken is much greater than it used to be?—Yes.

54,659. The mussel-beds are yielding more than ever they did?—Yes, more.

54,660. They have been showing no signs of falling off?—It appears the more they get the more there is.

54,661. Do they find that the clearing of the banks by taking the mussels has increased the quantity?—Yes; whenever the stones get cleared, they get covered all over again with young.

54,662. You have seen them come in that way?—Yes; hundreds and thousands of mussels are destroyed by the young ones. They get on the top and catch the mud and in that way choke the old ones.

54,663. Then is it found that by thinning them in the way you fish them, you increase the quantity of mussels?—There is not the least doubt of it.

54,664. If the men here were to cease fishing for a season, would it increase or diminish the quantity of mussels?—I do not think there would be half as many.

54,665. Has the market ever been so low, or have circumstances ever occurred which have led to a diminution of the fishing, and if so, what was the consequence?—Such a thing has never happened as their having ceased to fish.

53,666. They have always worked for them?—Yes; but they work more extensively sometimes than at other times. Sometimes there have been good mussels got upon the coast of Ireland, and they have been sent into our markets, and occasioned a panic among the mussels.

54,667. Are the mussels taken for any other purpose except for food?—Some of them are taken for till.

54,668. What is till?—Manure.

54,669. They are bought for that purpose?—The fishermen get them themselves, and use them for manure for their garden grounds.

54,670. The fishermen do that?—Yes.

54,671. Do the farmers ever use them?—Yes; but not as many as they did within my recollection. I have seen hundreds of cart loads "kecked" up for manure.

54,672. That is not done so much now?—Not to half the extent it was.

54,673. But there has been no diminution in the mussels however they have been taken?—No.

54,674. You formerly had some herring-fishing in this bay?—Yes.

54,675. Was it a pretty regular herring-fishing?—It was for a few years.

54,676-7. How long ago is it since you recollect the best fishing you had here?—There was a good year about five or six years ago. They came for three or four years together at a certain day in the month, about the 8th of September. They came as regular as clockwork for two or three years together, but have not done so latterly.

54,678. Do they stop long in the bay when they come?—Sometimes they do, and sometimes they do not.

54,679. Do all the boats go herring-fishing when they make their appearance?—Yes, every one that can muster nets.

54,680. Have there been any herrings here this season?—No, not for the last two years; there has been nothing worth while going after.

54,681. What is the largest fishing you have seen of herrings; can you remember what quantity there has been taken altogether?—No.

54,682. Were they sold fresh or cured?—They were sold fresh, but I have known some of them sold cured. They have taken 14 or 15 cartloads from one baulk in one tide.

54,683. What is a baulk?—It is one of the things they set here on the scars.

54,684. Are they caught in them as well as in drift-nets?—Yes.

54,685. Are they the same nets that are set for catching flounders?—Yes.

54,686. For the last two years there have not been any?—No.

54,687. Have there been none this year?—No.

54,688. But if the herrings came they would at once give up shrimp-fishing and all other kinds of fishing, and go after the herrings?—Yes, the most part of them who could raise herring tackle. The chief of them have nets which have been laid up; but if the herrings were to come, then nearly all the boats would be out after them.

54,689. Then they have all drift-nets?—Yes, nine out of ten have.

54,690. Do they ever use seine-nets, or circle-net fishing, for herring catching?—No, they have only the long nets.

54,691. Which drift with the tide?—Yes.

54,692. When you had a good herring-fishing here, how long did it continue?—Sometimes until Christmas.

54,693. Was the shrimp-fishing given up during that time?—No, there were always men who went shrimp-fishing.

54,694. Do you suppose that the herrings spawn in the bays?—Yes, there is no doubt of that. If they get well shaped, you will see the spawn in them.

54,695. Do they spawn where you trawl for shrimps?—Yes, no doubt.

54,696. Does your trawl injure the herring spawn?—The herring spawn will be here also.

54,697. Is it caught by your shrimp trawls?—No, we don't get one in a thousand of them. They go out of the way.

54,698. Do you think that the absence of the herrings for the last two or three years has been caused by the shrimping that goes on here?—Not in the least. They run up into the shallow water of the Lune which we have close here. I imagine that they come here to shoot their spawn.

54,699. Do the herrings caught here come from the deep water outside?—Yes.

54,700. They would not be affected by your mode of fishing inside?—No.

54,701. Do you fish for herrings by day or by night when they come?—Sometimes in both ways, but chiefly by night.

54,702. It is only when the water is very muddy that you can fish by day?—That is all.

54,703. Is there any other place where you have heard of their fishing herrings by day except this?—I don't know. When they used to go out line-fishing on a fine day like this, before they had the herring-nets, we could see the herrings as thick as motes in the sunbeam, and we have seen porpoises within half a mile and close to us. The herrings came down on one side of the ridge as regularly as clockwork every day, before the herring-nets were thought of.

54,704. (*Mr. Lefevre.*) How long ago was that?—Forty years ago.

54,705. (*Mr. Caird.*) Then if a regulation was passed, by which no fisherman would be allowed to shoot his nets for herrings until after sunset, would it be injurious to the herring fishery if the herrings were to come in again?—I don't know, perhaps it might do it good. I don't know how that would be, but perhaps it would do it good.

54,706. Have the fishermen here any wish upon the subject?—There are a good many herring fishers here; perhaps they will speak on the subject; I don't know myself.

54,707. (*Mr. Lefevre.*) Do the fishermen go outside the bay after the herrings?—Some have gone as far as the Isle of Man, and some have been to Maryport.

54,708. How many boats would go that distance?—Perhaps a score or 30 would go there every year.

54,709. I suppose the great body of the boats would only fish when the fish came into the bay?—No, they did not go to fish outside. They only go seven, eight, or ten miles off the bay here.

MORECAMBE.

J. Bell.

30 Sept. 1864.

54,710. Is that beyond the bay?—Yes, right down out at sea.

54,711–2. In what condition are the herrings when they came into the bay?—Some of them are very good, and some are not quite so good. They are rather shotten.

54,713. When they come into the bay they are full of spawn?—Yes.

54,714. And you think that occasionally they are shotten?—Yes.

54,715. Then some of them at that time are full of spawn?—Yes.

54,716. Do you know on what ground they spawn in the bay?—No.

54,717. You have never observed that?—No.

54,718. Is there any part of the bay where the fishermen sink their nets to the bottom of the ground, in order to take them where they are spawning?—They sink their nets to a certain depth, but they do not sink them to the bottom. If they do, they do mischief.

54,719. They tear their nets?—Yes.

54,720. Do they ever anchor their nets on the rough ground?—No, in the Lune they do not find the bottom. They do not sink their nets when they cannot find the bottom; but at times they are caught by the shift of the tide, and sometimes they catch the bottom and tear the nets sadly.

54,721. Is there much rough and rocky ground in the bay?—Yes, there is a good deal of rough ground off here.

54,722–3. Is that where you find the herrings?—It is close to it; they drift out to it from the Lune.

54,724. Is it on the rough ground that the fishermen sink their nets?—No, it is in the deep. Occasionally they drift on to the rough ground.

54,725–6. Do you say that you never take any young herrings in the trawl?—No. I never saw such a thing.

54,727. Are there any boats which are used exclusively for trawling for flounders?—No.

54,728. Is there any time of the year when a great number of the shrimpers give up shrimping and take to flounder-fishing?—No; they have no particular time. When they find they are not getting a trade by shrimping, and that they are not getting as many as they require, they will try trawling for flukes.

54,729. That is when they do not find many shrimps?—Yes.

54,730. Is that in the winter during a hard frost?—Yes.

54,731. Do you think there are as many flukes to be found then at that time or not?—They are chiefly in the holes in the deep then. When it is the spring time of the year and warmish water, they go on the banks.

54,732. You can trawl on the banks, I suppose?—Yes.

54,733. Would it be a great disadvantage to the shrimpers here, to be prevented from shrimping during the months of November, December, and Jauuary?—Yes, it would be a great disadvantage to them; there are a deal of shrimps caught then.

54,734. The Dumfries fishermen told us that it would be no disadvantage to have a close-time during November, December, and January, on the ground that they caught more small fish then than at other times of the year; what would be the effect upon the fishing here, if there were a close-time during those months?—They do not go generally then.

54,735. Is there not much shrimping carried on then?—No, very little during those months. If it be rather frosty it kills them as they are taken out of the water.

54,736. The frost kills the shrimps?—Yes.

54,737. Then the fishermen during those three months are not much engaged in shrimping?—No, they are mostly among the shell-fish.

54,738. They are not trawling for flounders?—They trawl for flounders as well.

54,739. What is the size of the mesh of the trawl-net for flounders?—I do not know. It is just sufficient for them to catch a sole of a quarter of a pound in weight.

54,740. Are all the boats provided with trawls for flounders?—No; there are not many of them. There are not above a score of trawls in the place. Indeed, I think there are not above five or six.

54,741. Where do they send their flounders to?—They are chiefly used here, and in Lancaster market.

54,742. Are there not many sent to Liverpool?—No, very few. They may send a few on a chance time, but they very rarely go away.

54,743. The whole supply is not a considerable one?—No.

54,744. You recollect this place 40 or 50 years ago, when you say there were only eight or nine boats shrimping, were there any boats then employed in trawling for flounders?—No.

54,745. When did trawling for flounders begin?—Not many years ago; I think about the time when the last herring-fishing came; perhaps it will be between 20 and 30 years. It was the Southport people who came here, and induced us to get trawls.

54,746. Has the number of boats employed in flounder-fishing fallen off since then?—I think it has. There are not as many trawls in the place as there were then. Very nearly all of the fishermen had them then.

54,747. How many were trawling then?—Half a score.

54,748. And now there are not more than five or six?—No.

54,749. What is the number of fishermen here altogether?—I do not know. I should say there are above 200.

54,750. And of those how many are there shrimping?—There are 150 of them at times. Nearly all shrimp in the spring of the year.

54,751. What is the size of the boats?—They are of all sizes.

54,752. What is the size of the larger class of boats?—They shrimp in big ones, and in others about 17 feet.

54,753. What is the size of the large class of boats?—Twenty-four feet keel.

54,754. And the smaller ones are about 17 feet keel?—Yes.

54,755. Do the larger class require more than one man?—No, they go with one man in a large boat as well as in a small one.

54,756. Do you know whether the flounders fall off and decrease with the supply of mussels in the bay?—Yes, I think the channel has rather hurt the flounders.

54,757–8. In what way?—In consequence of the channel leaving us and going to the other side.

54,759. When the mussels are not in great abundance, do the flounders fall off too?—Yes, they go more on the banks. They always follow their food.

54,760. Are the mussel beds extensive here?—Yes.

54,761. What is the area; can you form any idea?—No, I cannot. There are a great number of acres, however.

54,762. Do they vary much according to the shifting of the sands?—The young ones vary as much as anything.

54,763. Do they riddle the mussels on the banks?—No.

54,764. Do they bring them all to land and riddle them there, and send the large ones to the market?—No, I can recollect when we have brought the young ones, and thrown them out, all up and down, where we thought they would have a chance of growing into large mussels. We have all of us gone out and gathered and loaded our boats with them, and put them in holes up and down where we thought they would be safe; but sometimes not one has done any good, they have all been sanded up.

54,765. You have laid down the small ones in the

hope that they would increase?—Yes, we have thrown them into the deep.

54,766. And it has not done any good?—No.

54,767. When you riddle them on the shore, do you sell the refuse and the small ones for manure?—Yes, and we use them ourselves.

54,768. What number of men is employed during those months in taking mussels?—I cannot say, I think not many. The children can go out at times when there are good tides.

54,769. (*Mr. Caird.*) Do all the shrimps go by rail to the market?—Yes, chiefly. Part go to Lancaster.

54,770. I suppose a great quantity go by rail?—Yes.

54,771. What markets do they go to?—All over the country. Some of them go as far as Bristol.

54,772. Do they go to Birmingham and Manchester?—Yes.

54,773. And to Yorkshire?—Yes.

54,774. And London?—Yes; I daresay some go to London.

54,775. (*Mr. Lefevre.*) Is there any time of the year when you have observed more young fish taken in the trawls than another?—Sometimes I think they take more at the back end of the year.

54,776. In what months?—Just before they give over fishing.

54,777. In what month?—It is some time in November.

54,778. Are there more young fish caught in the months of November, December, and January?—No; sometimes in the spring there are quite as many caught, but at the back end they destroy the greatest quantity of shrimps with the push-net.

54,779. Is that the hand-net?—Yes.

54,780. They destroy more young fish in that way?—Yes.

54,781. Are there more young fish destroyed in that way in November, December, and January, than in the three following months?—I can hardly say.

54,782. Is there much difference?—No.

54,783. Would it be any advantage to the flounder-fishing if those three months were made close-months, so that no shrimps or young fish could be taken during those months?—I do not know whether it would or whether it would not. The fishing has been practised as long as I can recollect, and I do not see that there has been any falling off.

54,784. Then you do not think it would be of any advantage?—No, it never has been in my recollection.

The witness withdrew.

James Woodhouse called and examined.

54,785. (*Mr. Caird.*) Are you a shrimp fisherman here?—Sometimes in the spring.

54,786. What else do you do?—I follow long-line fishing, herring-fishing when there is any, and flounder-trawling sometimes.

54,787. Do you also fish for mussels?—Yes, just which I think I can make most by.

54,788. You take to anything you think you can make most money by?—Yes.

54,789. Which is the mode you find most profitable to you?—I think shrimp-trawling is as good as anything, barring the herrings; the herring-fishing is best when there are any to catch.

54,790. Do you follow shrimping in the spring?—Yes.

54,791. Does it yield most in the spring?—Yes.

54,792. Do you get more shrimps, or do you get a better price?—The price is always alike here.

54,793. Then you get a larger quantity of shrimps?—Yes.

54,794. When do you cease to fish for shrimps?—About Whitsuntide, just in the height of the summer.

54,795. What do you do after Whitsuntide?—I follow company-carrying.

54,796. What is that?—I go with pleasure boats and carry the people who come here to visit the place.

54,797. You find that that pays better than shrimping?—We always turn to that job which we think we can make most brass by.

54,798. What do you do after the company time?—We then go fishing with long-lines.

54,799. Do you go far to sea with long-lines?—In a regular way we go right out in the centre of the channel between Piel and Fleetwood.

54,800. Is there always deep water there?—Yes.

54,801. In what depth do you fish with your long-lines?—In five or six fathoms.

54,802. Is it a sandy bottom or a rough bottom?—We put them on a sandy bottom where we can find any.

54,803. What is the length of your lines?—They are three or four miles long.

54,804. How many hooks will there be on a whole set of long-lines?—About 120 lines.

54,805. How many hooks on each line?—Ten on each line.

54,806. That would be about 1,200 hooks?—Yes.

54,807. How do you bait them?—With little flukes, and any kind of small fish.

54,808. You do not bait them with mussels?—Mussels will not do, because there are so many vermin about that would take them off as soon as we put them down.

54,809. What kind of vermin do you refer to?—Whelks and cross-fish.

54,810. Do they eat the bait?—Yes.

54,811. Do they not eat the other kind of bait?—Yes; but it is a deal tougher, and more difficult to get off.

54,812. What kind of fish do you catch on the long-lines?—Ray and blewitt.

54,813. What is blewitt?—Skate.

54,814. What else do you catch?—Codfish and dog-fish.

54,815. Dog-fish?—Yes.

54,816. You do not want to catch them, do you?—Yes.

54,817. What do you do with them?—Sell them.

54,818. Who buys them?—We sell them at Blackburn. They call them Darwen salmon.

54,819. Do the people eat them?—Yes, and like them as well as anything we can get.

54,820. Is it the common dog-fish that is got in other parts of the sea?—Yes, the common dog-fish; but we never can sell any except about Preston and Blackburn.

54,821. Do you get a good price for them?—Yes; the same as we can get for skate.

54,822. Do you get many dog-fish?—Yes, sometimes a good deal; but there is a difference at times.

54,823. Do you catch anything else?—No, nothing else.

54,824. Do you not get any turbot?—No, we get codfish; but nothing else.

54,825. Have any of those different kinds of fish you mention increased of late years, or have they diminished in the quantity you can take?—I cannot tell that there is any difference.

54,826. Do you get as many ray and skate as you used to get?—Yes, we get as many skate, but not as many ray.

54,827. Do you get as many cod?—No, not as many.

54,828. Has there been any decided falling off?—There has been very little difference, but we do not get quite as many I think.

54,829. Do you get any haddock?—No.

54,830. Any whiting?—No.

54,831. Do the dog-fish increase in number?—No, I do not think there is any difference that I can tell of.

54,832. Is it a profitable fishing altogether, the long-line fishing?—Yes.

MORECAMBE.

J. Woodhouse.

30 Sept. 1864.

54,833. Does it yield you as good a return as the shrimps, for the same time spent upon it?—Yes, I think it does.

54,834. Are there many people who follow the long-line fishing?—No, nobody except my brother and myself.

54,835. Is there only one boat at it?—No, there are two.

54,836. Two boats are all that go from here to the long-line fishing?—Yes.

54,837. Were there ever any more?—Yes, there have been perhaps three or four more since I can recollect; but they have fallen off.

54,838. There were never more than from two to four boats following the long-line fishing?—No.

54,839. Then it is a matter of small importance here as a fishery?—Yes, very.

54,840. Then what do you do after your long-line fishing is over?—We go after two or three mussels, or we go catching a few shrimps, or anything we can do in that way.

54,841. Do you agree with the former witness that the mussel beds are increasing in their yield?—They are quite as good as ever I can remember.

54,842. Are there many more mussels taken off them than there used to be?—Yes.

54,843. There are a great many more people employed at it?—Yes.

54,844. And still there are more mussels when they go for them?—Yes.

54,845. They do not show any sign of falling off?—No.

54,846. With regard to the shrimps, is there any sign of their falling off?—No, there are more caught than ever there was.

54,847. There is no sign of their yielding or giving way?—No, not a bit.

54,848. You do not find that you are over-fishing them?—No.

54,849. (*Mr. Lefevre.*) Do you recollect whether there were ever haddock in the bay?—No. I can never recollect more than one or two being caught in the bay at all.

54,850. What time do you trawl for flounders?—I trawl very little. The most I trawl is when I have my lines down, and then I trawl in order to get bait.

54,851. You only trawl for the purpose of bait and not for sale?—Yes.

54,852. Is there much fishing for codlings here?—Very little.

54,853. Are there many in the bay?—Very few.

54,854. You never try with the line at other times of the year than the summer?—We try sometimes in summer, and sometimes in winter, if we think we can make anything by it.

54,855. Have you taken any cod in the winter?—We have taken a few cod, but not many.

54,856. Not enough to make it pay in the winter?—When there comes a hard frost it drives the skate and the ray fish away, and it would not pay to follow the few codfish.

54,857. Would it improve the general fishery here for flounders and other fish, if, during the months of November, December, and January, shrimping were not allowed?—No, I do not think it would.

54,858. You do not catch a sufficient number of small fish to make it a matter of importance?—I do not think so.

54,859. Are there more young fish caught in those months than in any other part of the year?—There may be a trifle more caught, but I do not think it makes very much difference. They clear away all they can when they get them.

54,860. Do you mean that they throw them overboard when they get them?—Yes.

54,861. Do you say that you do not bring them to land before you separate them?—No, we empty them, and put the nets out again; and then we clean them and throw all the refuse overboard.

54,862. Have you not to manage the boat at the same time?—Yes.

54,863. How do you do that when you have only one man in the boat?—Some have two men, but not many.

54,864. But when you have only one man, can he riddle his shrimps and manage his boat as well?—Yes, but he cannot do as much of it; but he can do the same work.

54,865. You are quite sure they throw away the greater portion of the small fish?—Yes.

54,866. Are they alive when they are thrown overboard?—Yes.

54,867. They are none the worse for having been caught?—I do not think they are any the worse for it at all.

54,868. (*Mr. Caird.*) Is there any large sum of money got by the fishermen for the mussels here; do all that are sold bring in a large sum to the fishermen?—Yes, they bring in a deal of money in the course of a season.

54,869. Do they bring in half as much as the shrimps during the same time?—Yes, I should think they would.

54,870. More than that?—I think so.

54,871. As much as the shrimps?—No, I do not think they bring in as much as the shrimps.

The witness withdrew.

J. Woodhouse.

JOHN WOODHOUSE called and examined.

54,872. (*Mr. Caird.*) You have heard the evidence of the previous witnesses?—Yes.

54,873. Do you agree with all they have stated?—Yes. I have no fault to find, except with regard to doing away with shrimp-trawling for three months in the year. I do not think we ought to be stopped, especially as we throw away all the small fish we catch. What we get then does a great deal of good to the poor classes of the people.

54,874. You do not see that any advantage would arise to the fishery, if you had a close-time during three months of the year?—No.

54,875. You think you would lose a great quantity of fish that would otherwise be useful to the people?—I do not think we could have lived without it here.

54,876. Do you think the shrimps yield you a larger return than anything else?—Yes.

54,877. And it is a fishing you can follow any day of the year, if the weather suits?—Yes, except there be a hard frost, and then there would be no use in trying to fish, because the shrimps go down into deep water.

54,878. There is a market for them every day in the year?—Yes; and the scarcer they are, the better market it is.

54,879. You do not see that it would be of any advantage to the shrimp fisheries themselves, putting aside the interest of the fishermen, to have a close-time for three months?—No, I think it would do a deal of hurt.

54,880. The shrimps have not fallen off in consequence of being so much fished?—No, there are plenty of shrimps. This last year we have had the fullest shrimping that was ever known. The worst thing for the shrimp-fishing is to have such weather as we have had this summer. The shrimps then go on the banks, and there are many of them destroyed by the heat of the sun, after the tide has gone down. I do not think we shall have a good fishing next season. I have been a fisherman since I was a boy, and I know something about it.

54,881. Have you also been a mussel fisherman?—Yes.

54,882. Is there a good deal of money made by that?—Yes, a good deal of money.

54,883. Is it a valuable thing?—Yes, it is very valuable for the country. I do not know what we should do without mussel and shrimp-fishing in this country.

54,884. Do you hold them of more importance than

flat-fish ?—Flat-fish would be nothing for the fishermen here to make a livelihood out of.

54,885. Do you remember the time when there were more flounders caught than there are now ?—Some years there were more, and some years less.

54,886. Do you remember when there used to be soles here ?—Yes ; I believe I was the first man who tried to catch them.

54,887. Have the soles fallen off since then ?—Some years they have been better, and some worse. There has been very little difference since we started catching them.

54,888. Do you catch them in the same trawl which you use for shrimps ?—No, we have a sole-trawl on purpose.

54,889. Do you ever catch them in the same trawl you use for flounders ?—Yes, sometimes.

54,890. Do any large beam-trawlers come in the bay here ?—No.

54,891. Do they not come on the ground on which the long-line fishermen go ?—No.

54,892. They never come in here at all ?—No ; there is nothing to hurt the long-line fishing. I have followed it ever since I could walk.

54,893. It has not been increasing at all ?—No, it has not been diminishing. Some years we have a good season of codfish, and some years we have none. I am older than a good many of the fishermen here, and I know exactly what the fishing has been for a good many years.

54,894. Some years there are plenty of codfish ?—Yes.

54,895. But if there are only two or three or four boats, it is a small matter at the best ?—I have known five or six boats out, and sometimes only two. There have only been my brother's boat and mine for the last few years following the fishing.

54,896. Do not other boats come from other places to fish ?—No, not in our bay.

54,897. How far does your bay extend ?—Until you get outside of Fleetwood on one side, and at Piel on the other, and then round this bay.

54,898. (*Mr. Lefevre.*) Do the larger class of trawlers from Fleetwood fish here ?—No.

54,899. Do they go outside ?—Yes ; I never saw them trawling in the bay.

54,900. You have no complaint to make against them for injuring your fishing at all ?—No, none at all.

54,901. What is the size of the mesh you use in the flounder-trawl ?—The size of the mesh in our sole-trawl is about an inch and a half.

54,902. From knot to knot ?—Yes, we have no nets here for flounders. It is a sole-net that we use for catching bait for our long-lines. Sometimes we catch flounders in it as well.

54,903. The mesh of your sole-net is one inch and a half from knot to knot ?—Yes, it is a sole dredge.

54,904. Are the boats here numbered and registered at all ?—They used to be formerly, but they are not now.

54,905. Is there no person in authority to look after the fishing-boats and gear ?—No.

54,906. There are no regulations enforced among you ?—No.

54,907. What is the size of the mesh of your herring-net ?—If we can get a shilling between the mesh, it is a right mesh. We can go to Ireland or Scotland with that mesh. I have been in all those places to fish, and to the east coast as well, with nets of that size, and there never could be any complaint laid against me, because it was always the right size for a mesh.

54,908. Do the fishermen here generally have nets with that size of mesh ?—Yes, they are all made at one place.

54,909. How many meshes to the yard do they run ?—About 35 rows to the yard.

54,910. They shrink to rather less than the inch mesh ?—Yes, rather less than the inch mesh. They are the nets that are always used. I have been into all countries fishing, and they have tried our meshes at many a place ; but they never said we were wrong.

54,911. Nobody inspects your nets here to see that you use the legal mesh ?—No, nobody here ; but they have inspected them in other places.

54,912. Have they inspected them in Scotland ?—Yes.

54,913. But they could not find fault with them ?—No.

54,914. Are the boats and gear mostly the property of the fishermen here ?—Yes, in general.

54,915. Have some few of the fishermen had money advanced to them by the shop-keepers ?—Some may have, but it will be very few ; nearly all belong to the fishermen.

54,916. Have you been making a good thing of the fishing lately, taking all things together ?—We have been making a nice fishing. I have followed the job for many years, and I can make a nice living myself.

54,917. Are there any regulations which you would wish to have enforced here ?—No ; there could be no regulations here, without hurting the poor fishermen. I believe any regulation would do great injury to this country. I cannot see in what way the fishing here could be mended. If we get any small fish we endeavour to get them overboard as soon as we can, so that we may have a chance of catching them again when they grow larger.

54,918. You do not bring them ashore ?—We do not want to bring them ashore ; the fewer we get ashore the better.

54,919. Do you riddle the small shrimps on board and throw them overboard, or do you bring them on shore ?—We riddle them when we have time, but sometimes we cannot do it.

54,920. Is there any sale for small shrimps here ?—No, very little.

54,921. Are not the small shrimps brought on shore, and sometimes potted ?—Yes, picked and potted.

54,922. Do the poor people make much money by them ?—It gives employment to children. I like potted shrimps myself.

54,923. Do you get anything for them ?—Yes.

54,924. Do you get as good a price for them as you do for the larger ones ?—After the fish are picked they get a better price ; but it takes a great deal of time to pick them.

54,925. Does that account for your not riddling the shrimps so much before you come to the shore ?—We do as well as we can, in order to make the most money.

54,926. Is it a fact that in order to bring the small shrimps ashore, you do not riddle them on the ground ?—No, it is not, because many a time we do riddle them ; but sometimes we have not the time to do so.

54,927. Do you agree with Mr. Bell, that there is not a large number of men shrimping in November, December, and January ?—No, I do not agree with him.

54,928. Do they shrimp then ?—They are obliged to shrimp. They are only a number of poor men, and it is a living for them. Shrimps are worth more money at that time of the year than at any other, because they are very scarce. A man may go out for four, five, or six quarts then, and sell them at 6*d.* a quart.

54,929. They go on shrimping if the weather is mild, and if frosty weather comes on they stop ?—There is very little caught in frosty weather. The fishermen do very little at all if it comes on hard weather.

54,930. But supposing it is mild weather in the winter, are there many boats employed in shrimping ?—Yes.

54,931. You think it would be disadvantageous if it were put a stop to ?—I should not like to see a stop put to it, because there are a great number of poor men who would be very much put out of the way by it.

54,932. And it would be of no benefit to the other fisheries ?—No, I do not really think it would be.

The witness withdrew.

MORECAMBE.

J. Edmondson.

30 Sept. 1864.

JAMES EDMONDSON called and examined.

54,933. (*Mr. Caird.*) You are a fisherman here?—Yes.

54,934. And you have long been acquainted with the fishing of Morecambe Bay?—Yes, ever since I have been born.

54,935. Have you heard the evidence given to us by the other witnesses?—Yes.

54,936. Do you agree with all they have stated?—Yes.

54,937. Is there anything in those statements which you would desire to add to or alter?—No, I do not think you can alter anything. If you were to make the net larger, it would be injurious to the catching of shrimps, and we would catch as many small fish as we do now.

54,938. What is the size of the mesh of the shrimp net?—Half an inch from knot to knot in the biggest part, and smaller in the smallest part; there are three rows to the inch at the small end.

54,939. Is the size of the shrimp-net pretty regular among all the fishermen?—Yes, as near as we can come.

54,940. Do you make the nets yourselves?—Yes, every man makes his own.

54,941. Do not some make them smaller than others?—No; if they were to make them smaller, they would not answer as well, and if they were made larger they would not answer as well.

54,942. Then do you use what you believe to be the best size of mesh for shrimp catching?—Yes.

54,943. And you stick to that?—Yes.

54,944. Is there no regulation that enforces a certain size?—No.

54,945. There is no regulation that makes it compulsory upon the fishermen to fish in a particular way?—None.

54,946. Every man does as he chooses?—Yes.

54,947. (*Mr. Lefevre.*) Have you herring-nets of your own?—Yes.

54,948. Have you always followed herring-fishing, when they came into the bay?—Yes.

54,949. Have they come in most years here with some regularity?—They did come very regular for 15 or 16 years, then for 10 years there were none at all, and then we had them for three or four years. After that they dropped off again, and then we had them for three years, and now they have dropped off for the last two years.

54,950. You cannot say that they have been constant in coming to the bay?—No.

54,951. Have they been frightened by the quantity of trawling that goes on in the bay?—Not in the least; the fish all come from the outside when they come here; they come from the Isle of Man or from between there and Wales.

54,952. In what month?—In the month of September, and sometimes as late as October.

54,953. In August are there a great number of shrimpers at work in the bay?—No, there are not so many then; most of them are going to it in February, March, and April.

54,954. But in August and September, there will be still a considerable number trawling in the bay?—Yes, in August, September, and October there will be a great number.

54,955. Then you do not think that trawling for shrimps frightens the herrings out of the bay?—Not in the least.

54,956. Then their not coming here in some years is not due to the amount of trawling that is carried on?—Not at all.

54,957. Do you trawl on the same ground that you set your drift-nets?—No, not within many miles of it.

54,958. You trawl exclusively in the channel?—We always trawl for shrimps in the channel.

54,959. Do the herrings come up the channel?—I have known them come up the channel a chance time or two.

54,960. Generally they are outside the ground where you trawl?—Yes, many miles outside.

54,961. Do you know what ground they spawn upon?—No; I never saw any spawn where it was spawned.

54,962. Have you ever sunk your nets in order to take fish in the act of spawning?—No, we cannot say what time they do spawn; but we fancy when they come in September, that some of them are full bellied, and that some have spawned; but we never could learn where they did spawn.

54,963. Do you agree with the statement which has been made to us, that the fishermen do occasionally sink their nets?—Yes, they sometimes sink them five or six fathoms when they are in deep water.

54,964. It is only because you are in deep water?—Yes; we will probably be in 20 fathoms of water at the time.

54,965-6. It is not for the purpose of taking fish in the act of spawning, and close to the ground, that you sink the nets?—No; when the water is clear the fish swim deeper. In moonlight they swim at the top, but in a dark moon they go deeper and sink.

54,967. Can you give us no idea of the ground upon which the herrings spawn here?—No, I never could find out where they do spawn. None of us have ever got any herring spawn after it was spawned.

54,968. Is there much hand-trawling here for shrimps?—Not as much as there used to be. In former times there was a great deal more.

54,969. What is the reason of that?—The men do not like to follow it.

54,970. Is it harder work?—It is more slavish work, and requires more wadeing.

54,971. If you were restricted to hand-trawling for shrimps would that destroy the fisheries here?—They would not get as many shrimps. If they were all following hand-trawling they could not make a livelihood out of it. They can only go by the edge of the banks, and there is not sufficient ground for every man to drive upon.

54,972. A great deal of the ground is in the deep water; too deep for hand trawls?—Yes.

54,973. Would a man trawling by hand make as much money as if he were trawling in a boat?—No, he would not make 1*l.* by hand-trawling, where he would make 3*l.* in a boat.

54,974. (*Mr. Caird.*) I suppose you cannot set any drift-nets at all in the same channels as those in which you trawl for shrimps?—No.

54,975. They go comparatively dry at low water?—Yes.

54,976. You never do put out your drift-nets on the same ground that you trawl for shrimps?—Not once in a thousand times.

54,977. (*Mr. Lefevre.*) What is the depth of your herring-nets?—About three fathoms deep.

54,978. What is the length?—Each boat carries about 30 nets.

54,979. What length is each net?—Each net will be about 27 yards long.

54,980. Have you ever seen any young herrings taken in the shrimp trawls?—Yes, an odd one by chance; but it is very rare that we can get one in the shrimp trawl. We might destroy a score or two in a year.

54,981. Not more than that?—No.

54,982. When the herrings have been plentiful in the bay, have you taken many young herrings in the following spring in the trawl?—No, you may see thousands swimming in the water; but they are not destroyed either by trawls or by any nets we use.

54,983. But you do see thousands in the bay?—Yes, every day when we are going out fishing, we see them swimming in the water.

54,984. Do you agree with Mr. Bell, who told us that there is a great destruction of young fish in consequence of their being left dry in warm weather?—Yes, there is a great destruction in that way.

54,985. Have you seen young herrings destroyed in that way?—Not many, but there may have been a few.

54,986. What fish are they generally that are so destroyed?—They are generally flounders.

The witness withdrew.

JAMES BELL re-called and examined. MORECAMBE.

J. Bell.

30 Sept. 1864.

54,987. (*Mr. Caird.*) Can you tell us what proportion of the fish caught here is sent away by rail?—I think that 99 parts of the fish got here go away by rail.

The witness withdrew, and the inquiry was adjourned until the 1st of October, at Fleetwood.

Fleetwood, Lancashire, Saturday, 1st October 1864.

PRESENT:

J. CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

FLEETWOOD.

J. Turner.

1 October 1864.

JAMES TURNER called and examined.

54,988. (*Mr. Caird.*) Are you a fisherman?—I have occasionally been a fisherman for about 10 years, and more especially for herrings.

54,989. Have you been acquainted with the fisheries here for the last 10 years?—Yes.

54,990. Can you describe to us what fisheries are carried on at Fleetwood?—There are all sorts of fish brought in here, the same as at all other places.

54,991. What particular kind is brought in in the largest quantity?—Flukes and quantities of soles.

54,992. Has the whole supply of fish that is brought to this place been increasing, stationary, or diminishing during the last 10 years?—I think it has been increasing, but that is on account of the number of boats.

54,993. The number of boats has increased?—Yes.

54,994. Do you know what number of boats there are at present?—There are 23 or 25 of the larger boats.

54,995. Are they decked trawl-vessels?—Yes.

54,996. What may be their average tonnage?—From 30 to 60 tons.

54,997. About 10 years ago how many of them were there?—Only two or three about 12 years ago, and about 20 years ago there was not one.

54,998. Twelve years ago there were two or three?—Yes.

54,999. Have they kept gradually increasing?—Yes, they have gradually increased every year, two or three a year.

55,000. Is there the largest number here now that you ever had?—There was 29 at one time; I think four have been sold away, and one or two have been wrecked.

55,001. Is there any other kind of fishing carried on here except by means of these trawl-vessels?—There is a herring fishery at certain seasons from September until January.

55,002. Is the herring-fishing a regular fishing here?—No, there are some seasons when they never come at all.

55,003. Have they made their appearance here during the last two seasons?—No.

55,004. You have had no herrings here for two years in the bay at all?—No, not for three years.

55,005. Is there no sign of them this year?—I was out one night this year and did not get one.

55,006. Do you fish for herrings in a different class of boat?—Yes, in boats built especially for that purpose of from eight to 12 tons register.

55,007. Are they half-decked boats?—Yes.

55,008. Do the same fishermen go to the herring fisheries as usually practice trawling?—Not generally; but if they find they can get more money by the herrings, they will leave the trawl-boats and go with the herring-boats.

55,009. When the herrings appear in the bay are there more fish for the trawl men?—Some of the boats do occasionally get more; one year there were a great many flukes in when the herrings were here; some got as many as 20 tons of flukes in a day just at the time the herrings came on the coast.

55,010. How long did that last?—For a fortnight or three weeks.

55,011. How many boats are there engaged in the herring fishery when there is a favourable season?—The Morecambe Bay, Whitehaven, Maryport, Southport, and Lytham boats come here.

55,012. They all gather in the bay?—Yes, there will be about 200 sometimes.

55,013. When the herrings are there do you find it a profitable fishing?—Yes, particularly profitable.

55,014. More so than any other description of fishing?—Yes.

55,015. Then has the want of the herrings been a considerable loss to the fishermen for the last two years?—Yes, certainly; I have got 60*l.* in a week myself by the herrings, and some of our boats have got upwards of 70*l.* worth of fish in a week.

55,016. Of herrings?—Yes.

55,017. How many men were there in a boat?—Three.

55,018. What is the length of your drift-nets?—They average from 20 to 30½ sheets, and they average 32 yards each; you may take it at 25 times 32, and they are about 3½ fathoms in depth, or about 22 feet. The nets are made on the same principle as those with which they fish on the Manx coast, but having so much shallower water we make shallower nets.

55,019. They are all drift-nets?—Yes, there are a few fixed nets on the flat sands between this and Morecambe, but they have gone out of fashion since drifting came up. Thirty years ago all the herrings in this district were caught by fixed nets, but since we began drifting the people do not take the trouble to set them as they used to do.

55,020. Do you adopt any regulations among yourselves as to the time of the evening when you shoot your drift-nets?—No, they shoot them in the daytime, or as it suits their own convenience.

55,021. There is no regulation?—No; the greatest catch that I ever got was in the daytime, at 12 o'clock at noon.

55,022. Was that when the water was in a muddy state?—Yes; we could not get them if the water was in a clear state. At night there is a good deal of phosphorus in the water and we cannot get the fish.

55,023. Then a muddy state of water is favourable for fishing?—Yes.

55,024. Is this the only place you ever heard of where they shoot their nets during the daytime?—No; I have fished at Whitehaven, and I have fished there in the daytime.

55,025. Was that in muddy water?—We never get so many there, but I have fished there several times in the daytime and only got very few; perhaps a few hundred.

55,026. Was it in clear water?—Yes.

55,027. Do you think that injures the fishing?—No; but it was scarcely worth the trouble. We let the nets go a little more to the bottom of the water.

55,028. If the water was clear here would you have your nets out in the daytime?—No.

55,029. As a matter of choice you would not?—No; experience shows that you would only get your trouble for your pains.

55,030. What other kind of fishing is there carried on here?—Shrimping, and the herring-boats go trawling occasionally.

55,031. Trawling for shrimps?—No, for flukes and soles in the channel, and in this bay as well. In the

FLEETWOOD.

J. Turner.

1 October 1864.

summer months they go trawling, and in the spring of the year.

55,032. Is there a shrimp fishery in the neighbourhood of Fleetwood?—Two or three boats make a practice of it, but nothing like they do at Morecambe.

55,033. It is not a matter of great importance here?—No, not at all.

55,034. Have you any mussel fishery of great importance?—There will perhaps be eight or nine, or may be a dozen, employed in it on both sides of the water.

55,035. Are you aware whether the mussels are diminishing at all?—I should think there are quite as many as ever there were.

55,036. Do the fishermen make a good livelihood by fishing mussels?—Not very.

55,037. Do they make any money by fishing for flukes?—No.

55,038. It is not a very paying business?—No; they take to it as a matter of necessity to keep them from starvation.

55,039. There are no other shell-fish, no oysters here?—No.

55,040. Or lobsters?—No; but a few oysters have been stored here for a month or two back. They were brought from Arklow and laid down as a private fishery.

55,041. Were they laid down to be sent to the fish market as they were required?—Yes.

55,042. Has that been continued for some time?—It is three months since the first cargo came, but none have gone to the market from it.

55,043. Do you know with what success it has been attended?—No, it has only been a trial, but I believe they have spent 1,000*l.* in the concern.

55,044. Have they formed a company?—Yes.

55,045. Is the ground upon which the oysters are laid dry at low-water?—Yes.

55,046. That will not be suitable in the winter time?—They will take care that they are slightly covered in the winter time on account of the frost.

55,047. To return to trawl-fishing, have the length of the beam and the size of the trawl increased in your experience?—Yes, considerably.

55,048. What is the length of the beam now?—They have only increased as the boats have increased in size. They carry a beam from 48 to 50 feet long now.

55,049. Forty-eight to 50 feet?—Yes; some of the beams will be 50 feet.

55,050. Can you tell us from your own knowledge whether the supply of soles brought in here is increasing or otherwise?—It is increasing, because the boats have got so much larger and there are so many more than there originally were.

55,051. And is there a larger supply coming to the market?—A great deal more goes off by the rail. I can see that by the carriages.

55,052. Has there ever been much cod caught here?—Not very much.

55,053. Is it increasing or diminishing?—I do not know.

55,054. Do you get any turbot?—Yes.

55,055. Are they increasing?—I cannot speak to that. There is a greater mass of young cod in the river than I ever saw before. Every bit of the water is full of them. There are millions of them, the size of minnows.

55,056. (*Mr. Lefevre.*) Have the herrings not been anywhere off the coast here?—No.

55,057. Not off the Cumberland coast or Whitehaven?—No, no nearer than the Isle of Man.

55,058. I suppose the herring-boats are not fit to go any distance to the Isle of Man fishery?—I have been to the island fishing from here.

55,059. Do many go?—No, and we only went that season. I have been in the habit of going to Whitehaven and Maryport for several years back.

55,060. Did not the trawlers come here regularly from Blackpool and Southport?—Yes.

55,061. There was a kind of colony from Southport?—Yes.

55,062. Do you know anything of the trawlers at Southport now?—Most of them who are now here are Southport men.

The witness withdrew.

P. Rimmer.

PETER RIMMER called and examined.

55,063. (*Mr. Caird.*) Are you a trawl fisherman?—Yes.

55,064. Have you been long engaged in that business?—For about 40 years.

55,065. As a trawler?—Yes, and cod fisher together.

55,066. What was the size of your trawl-vessel about 40 years ago?—About 18 tons.

55,067. What size is it now?—It is upwards of 50 tons. Fifty is the largest.

55,068. Do you agree with the previous witness that the principal increase in the number of vessels trawling has taken place within the last 10 or 12 years?—It has in some things.

55,069. In the number of vessels trawling?—Yes, they have increased within the last 12 years.

55,070. Very much?—I cannot say so much. In some places they have increased and in some others they have decreased. At Southport there are not as many as there were.

55,071. But how is it here?—There are more at Fleetwood, but they had not commenced much fishing here then.

55,072. Where have you been in the habit of fishing with your trawl vessels?—All the way from Liverpool to the Isle of Man.

55,073. Have you been north of the Isle of Man?—To Ayre point, but no further.

55,074. Do you not go up the Solway at all?—No.

55,075. Have you never been there?—I have never been there in my life.

55,076. Has that particular district between Liverpool and the Isle of Man been fished for 40 years within your knowledge by trawl-vessels?—Yes.

55,077. By an increasing number of vessels every year?—No, not now.

55,078. Are there not as many?—There have been as many, but there are not as many now as there were. They keep selling them off.

55,079. Then there are not as many now as there were some years back?—No, not as many as three or four years back.

55,080. What is the cause of that?—I don't know.

55,081. Have they been getting fewer fish?—No, there are plenty of fish.

55,082. Have the fish not been selling as well?—They have not been selling as well in these poor times. There is nobody to buy them.

55,083. What kind of fish do you catch with the trawl-vessels?—Soles, turbot, ray, brill, flukes, and conger eels.

55,084. Do you get a large quantity of soles?—Yes.

55,085. They go to the higher classes for consumption?—Yes.

55,086. Do you think that any injury has been done to the spawn by the trawl-boats?—No.

55,087. When did you go out last to fish with your trawl-vessel?—I was out last Monday.

55,088. When did you come in again?—Yesterday.

55,089. How often did you put your trawl down during the time you were fishing?—Every six hours.

55,090. Where did you go to fish?—Off Blackcombe.

55,091. What ground did you go over during that time?—Four or five miles during every six hours.

55,092. Backwards and forwards with the tide ?—Yes.

55,093. When did you get to the ground ?—On Monday night.

55,094. Did you let down your trawl at once ?—Yes.

55,095. Then you would probably have eight hauls of your trawl during that time ?—We had more than eight hauls.

55,096. What fish did you catch during all the time; what kind and what quantity were caught?—We caught soles, turbot, plaice, all sorts of flukes, gurnards, and conger eels.

55,097. Can you tell us the quantity?—Not exactly.

55,098. Near about ?—About 18 score weight of sole, turbot, and brill.

55,099. Was that the whole of your take ?—Eighteen score weight of that kind of fish.

55,100. What other kinds did you catch ?—Plaice, flukes, gurnard, and congers.

55,101. What weight would you have of them ?—I cannot exactly say.

55,102. Can you give us any idea ?—Perhaps 20 baskets averaging three score in each basket.

55,103. Was that the whole of your catch during the time you were out ?—Yes.

55,104. Which of these will bring the most money; the 18 score weight or the 20 baskets ?—I don't know how they have been selling, but I think the 18 score weight will bring the most money.

55,105. What would the 18 score weight produce to you as a fisherman ?—I shall not know until 4 o'clock to-night when I will get my returns, but they will average about 6*d.* a pound.

55,106. What will the baskets of the other kind of fish average ?—Five shillings or six shillings, taking one with another.

55,107. Six shillings a basket ?—Yes.

55,108. Are the soles you caught last week of as fine quality as those you caught 10 or 12 years ago ?—Some of them were; we caught more little ones then than we do now.

55,109. Are they about the same quality ?—Yes, about the same.

55,110. Are there as many of them caught now ?—Yes.

55,111. Taking the average, one week with another, do you get as good a fishing now as you did 10 or 12 years ago ?—Yes.

55,112. With regard to turbot did you have any this last week ?—Three I think.

55,113. Were they fine fish ?—Yes.

55,114. Would that be what you used to take in former years ?—Sometimes we might be a week or a fortnight and catch none ; that has been the case ever since.

55,115. There has been no marked difference in that respect ?—No.

55,116. In regard to other fish, is there any marked difference compared with what the fishery was 10 or 12 years ago ?—No, there have been no conger sometimes, and at other times they have been thick enough.

55,117. Do you ever catch haddocks ?—Yes, but they have left the coast for five or six years altogether.

55,118. Have they entirely left the coast ?—Yes.

55,119. Do you get any whiting ?—Some odd ones, but not at this time of the year.

55,120. Do you get them as numerously as ever you did ?—Yes, since I can remember.

55,121. Are haddocks the only kind of fish that have left you ?—Yes.

55,122. The only kind ?—Yes.

55,123. By trawling over the same ground, over and over again, do you find that you diminish the quantity of fish upon that ground ?—We shift about very much, sometimes we are on one part and sometimes on another, according to the time of the year.

55,124. You do not find that the fish are getting scarcer ?—No, they are as plentiful as ever they have been.

55,125. They are just as numerous as ever ?—Yes, just at this time.

55,126. Do you follow any other kind of fishing except trawling ?—Not of late years, but I have been cod-fishing in the winter season.

55,127. What is the length of the beam of your trawl ?—About 43 feet.

55,128. Is that about the largest here ?—No, there are some larger.

55,129. Can you work a larger beam than that successfully ?—A larger boat could wrok a larger one.

55,130. How many men have you in a boat ?—There are four of us; four men and a boy are in many of the boats.

55,131. (*Mr. Lefevre.*) Is that the crew that most of the vessels here carry ?—Yes.

55,132. What would you say with regard to a law prohibiting you from having a beam more than 38 feet in length ?—It would not do for us ; we should not catch any fish.

55,133. Would you catch no fish ?—No, we should catch nothing.

55,134. Then it would not be advantageous to the fishing if you were prohibited from having a beam more than 38 feet in length ?—No, our boats would run away with them, and we could catch no fish.

55,135. If the beams were shorter the boats would run away with them ?—To be sure they would.

55,136. Did you ever hear of a law that the beam should not be more than 38 feet?—I have heard tell of such a thing.

55,137. Has it ever been enforced here ?—No.

55,138. Are any of the beams longer than yours ?—There are some a little bit longer, but not much.

55,139. What is the longest ?—I cannot tell you.

55,140. But some are longer than yours ?—Yes.

55,141. Do they proportion the beam to the size of the vessel ?—Yes, that is about it.

55,142. What is the weight of your trawl-irons ?—I know the weight of them when they were new, but they are not as heavy now.

55,143. What should you say is the weight of them ?—About seven score and twelve pounds apiece.

55,144. What is the size of the mesh of your net ?—We have different sizes.

55,145. What is the size of yours ?—In some parts I can put my hand through it, and at other parts the mesh is less.

55,146. What is the size at the largest part ?—I can put my four fingers in it ; that is more than three inches.

55,147. What is the size of the mesh at the back of the net ?—Between three and a half and four inches.

55,148. Is it not as small as an inch and a half from knot to knot ?—No, we should catch nothing with a mesh of that size. It would fill with sand, and we should catch nothing.

55,150. Do you think the greater number of the trawl-nets have a mesh in the back of the net as large as that ?—Yes, they are all of a size.

55,151. What in general is the smallest class of fish you bring in ?—The smallest size would be sometimes half a pound.

55,152. Will they be seven or eight inches long ?—Yes, I daresay they will.

55,153. Do you bring in fish that are not fit for sale ?—No, it would be of no use bringing them in if they were not fit for sale.

55,154. Do you throw any overboard when you take the net up ?—Yes, but they are generally alive. We throw a great many dog-fish over that would do us no good if we kept them.

55,155. Do you trawl off the Isle of Man ?—Not very near to it.

55,156. What distance from it ?—I have been fishing 10 or 12 miles off it.

55,157. Do you ever fish on the ground where the coralines are to be found ?—It is a long time since I have done so. I had a few hauls, but it was 10 or 12 years ago.

FLEETWOOD.

P. Rimmer.

1 October 1864.

55,158. Have any of the boats from here fished on that ground ?—I think it is a long time since.

55,159. Do you generally fish in company ?—No, some fish in one place and some in another.

55,160. What do you do in the summer time ; do you send your fish to market every day by one of the boats ?—A boat comes in every day, and we carry for one another.

55,161. Then you are in company ?—Yes, in the summer time. We take it in turns to carry.

55,162. Do you in the winter keep the fish to the end of the week ?—No, sometimes we send them in.

The witness withdrew.

R. Leadbetter.

RICHARD LEADBETTER called and examined.

55,172. (*Mr. Caird.*) Have you long been a trawl fisherman ?—About 16 or 17 years.

55,173. Do you agree with the previous witnesses that there has been a large increase in the number of trawlers during that time?—There has been an increase here in the number of trawlers, but there has been a decrease in other places. I do not consider that there are any more trawlers here on the coast than when I began fishing.

55,174. You have been fishing on the coast between Liverpool and the Isle of Man ?—Yes.

55,175. Taking the whole of the vessels which go on that coast, you think there is no increase ?—No, there has not been for years.

55,176. Have the vessels increased in size during that time ?—Yes.

55,177. Then if there is the same number of vessels, there is a larger extent of net used now than then ?—Yes, there is. Of course we could not do with the same size of nets in the large boats as in the smaller ones.

55,178. Can you say from your own experience as a fisherman, that the quantity of fish you can take now has increased or has diminished compared with what it was 17 years ago ?—I believe they are as plentiful as they were when I first began.

55,179. What are the different kinds of fish that you catch ?—Soles, turbot, brill, flukes, conger eels, a few cod, and sometimes in the year ray fish.

55,180. Skate ?—Yes.

55,181. Have the soles in your opinion continued to be as plentiful and of as good quality as they were when you began the fishing ?—They have been more plentiful, and they have been so for the last eight or 10 years. There are a great many more of them than when I first began; I should think there are more than as many again.

55,182. Have you during all that time fished upon the same ground ?—Yes.

55,183. That is the ground between Liverpool and the Isle of Man ?—Yes ; I have been trawling there regularly at different places at different times of the year.

55,184. And double the quantity of soles are taken now compared with what there were when you first began fishing?—Yes ; but they trawl now more where the soles are than they used to do. They used to trawl about the foot of Liverpool Channel, and there are not as many soles as there are in deep water.

55,185. You find the soles further out at sea?—Yes.

55,186. What depth of water do you find best for soles ?—That depends upon the time of the year. In the summer time they come into shallow water of from 10 to 15 and 20 fathoms.

55,187. Are there any particular banks that yield soles more than others on the ground known to the fishermen ?—There are more in some places at different times of the year ; but they shift.

55,188. You find that in the summer time they come into shoal water ?—Yes.

55,189. Is that the case with all the fish you catch? —There may be plenty in the deep water ; but we are nearer home when we are in shoal water.

55,190. You find them then in shoal water ?—Yes.

55,191. Not in the winter ?—No ; we generally go where we can catch most.

55,192. Have the turbot increased or diminished, or are they about the same ?—They are about the same as they were when I first began.

55,193. And brill ?—They are about the same.

55,194. And conger also ?—Yes.

55,195. How are cod ?—They are the same.

55,196. Do you get any fine cod ?—There have been a great deal more cod got for a year or two back than when I first began.

55,197. In the trawl-nets ?—Yes.

55,198. Do you get any fine cod in the trawl-nets ? —Yes.

55,199. What weight will they be ?—From 15 to 30 pounds.

55,200. (*Mr. Lefevre.*) What time of the year do you get cod ?—We get odd ones from the latter end of March until the beginning of April.

55,201. (*Mr. Caird.*) Are skate as numerous as they were formerly ?—Yes.

55,202. Then all kinds of fish with the exception of the haddock are as plentiful as ever ?—Yes. There used to be a vast quantity of haddocks caught here ; but now there are none got on this coast.

55,203. They seem to have disappeared altogether? —Yes.

55,204. Have you any idea what has been the cause of that ?—No ; they had gone away before there was much trawling. Some old men a deal older than I am remember their being on this coast and going away, and they never knew the cause of it. That was a time when there was not much trawling.

55,205. They have been on the coast before, and have left and come back again, and left again ?—Yes.

55,206. No cause can be assigned for that in your opinion ?—Not that I can find out.

55,207. Then it is possible they may return again? —Yes ; in some men's days but not in mine.

55,208. Do you ever come into contact with the line fishermen on the ground on which you fish ?—Yes ; they sometimes come out where we are fishing.

55,209. Do you foul their lines ?—Not if we can help it ; sometimes in the night we may come across them.

55,210. Do they make any complaint against you for doing so ?—Not if we haul our nets and clear them.

55,211. Do they not say that you are destroying the fishing ground and preventing them from fishing as they used to do ?—They are the Manx lines ; we never come into contact with them from here.

55,212. Do not the long-line fishermen here come upon the same ground as you ?—No.

55,213. They do not go as far to sea ?—No; but the Manx fishermen come up here.

55,214. You do not interfere injuriously with each other ?—No. I have seen the Manx men out at Blackpool where we fish in the summer time. Their boats are as large as ours.

55,215. What kind of fish do they get ?—I have not been on board, but I think they get a deal at times.

55,216. Do they get the same kind of fish that you do ?—Yes ; they caught haddock at the time we did, but they don't get any now.

55,217. What kind of bottom is it you generally find between the Isle of Man and Liverpool ?—There are different sorts, mud, sand, shells, and stones.

55,218. You cannot trawl on the stones I suppose? —We do sometimes, but we haul our nets up.

55,219. You avoid it if you can ?—We are obliged to go there sometimes. The fish go there in the winter time. They leave the shallows and take to the rough ground.

55,220. You risk your nets then ?—Yes.

55,221. Do you suffer much injury from that ?—

Yes, it sometimes happens that we trawl for a week and lose more than we get.

55,222. But it answers you on the whole to run that risk?—Yes, we are obliged to go where the fish are to get a living.

55,223. On the whole, having been yourself a fisherman for a considerable time, has it been a prosperous business for you?—I have made a living by it.

55,224. Is that the case generally with those who follow the same business?—Yes, in general.

55,225. They are rather improved in their circumstances?—Not so very much I think; some of them may have improved a little, perhaps.

55,226. Do you in your trawl-vessels, frequenting a channel so much used by merchant vessels, give any assistance to them in times of storm?—Yes, often enough.

55,227. Do you act as pilot for them?—We engage with them to take them either into harbour or until we fall in with a pilot.

55,228. Is it frequently the case that you have been of use in saving vessels in that way?—Yes, and then they give us what they think fit.

55,229. Then you are often at sea in stormy weather?—There is scarcely a vessel that comes into port but what is seen by a fisherman somewhere.

55,230. Would you say from your experience that merchant vessels would often be lost in this channel if it were not for the assistance you afford them as fishermen?—Yes, our fishermen have saved a good many vessels in that way.

55,231. (*Mr. Lefevre.*) You said that the number of boats had not much increased during the last 17 years?—I don't think there are many more boats on the coast than there were 17 years ago.

55,232. How many are there fishing from Southport, Liverpool, Whitehaven, Blackpool, and along this coast altogether?—I cannot say; there were 70 out of Liverpool then.

55,233. What number used there to be, taking all the trawlers that fished over this ground?—There would be 70 out of Liverpool, but I don't think there are more than 50 now. Where there used to be four or five here there are now 20.

55,234. The number has increased here and diminished from Liverpool?—Yes, the number has also diminished from Southport. There used to be 15 or 16, and now there are only seven or eight.

55,235. They use a smaller class of vessel compared with those from here?—They are a great deal smaller than ours.

55,236. What is your season for going to the Isle of Man?—From November till April.

55,237. Do you trawl within an easy distance of the Isle of Man?—Eight or ten miles when we are nearest.

55,238. Do you take your fish in there sometimes?—Yes, when the wind is blowing hard from the land we keep near for shelter.

55,239. Do you fish in Ramsay Bay?—No.

55,240. Or in Douglas Bay?—No, there is no bay fishing there at all.

55,241-2. Do you fish on what the Manx men call the coralline grounds off the Isle of Man?—We fish nowhere but on what they call the trawl-ground, and that has been trawled ever since I can remember, about 10, 15, or 20 miles from the island.

55,243. Have you ever taken any herring spawn up?—I never caught any herring spawn there in my life.

55,244. Have you never taken up spawn in your trawl-net at all?—There has been some little got about Blackcombe for about a month, but never in any quantity.

55,245. When you are fishing off the Isle of Man do you fall in with the herring fleet?—We never dare to fish there when the herrings are there.

55,246. Do you avoid the ground when the herrings are there?—Yes.

55,247. You dare not fish there you say?—Well we dare fish if we were put to it; but our fish leave the coast when the herrings are there.

55,248-9. Why is it you do not dare to fish where the herrings are being fished?—Because they are in-shore on the rocky ground. We dare not go there or we should lose our gear.

55,250. When the herrings were on this coast did you leave trawling altogether and go after herrings?—Yes, sometimes.

55,251. Were you often trawling when the herrings were on the coast?—Yes.

55,252. Were you often fishing within three miles of the herring-boats?—No, we were always fishing at a greater distance than that; we never fished within that distance; generally we were further out.

55,253. Further off than three miles from them?—Yes.

55,254. Are you often fishing within the bays on the Lancashire coast, Morecambe Bay, and all the other bays on the coast?—No, not nearer than 15 or 20 miles from here.

55,255. Do you fish within three miles of the Cumberland coast off Whitehaven, Workington, and Maryport?—No, we are always 10 or 15 miles off there.

55,256. Then it would be no disadvantage to be prohibited from trawling within three miles of the shore?—No, I think not. It would not injure us I think.

55,257. It would not injure you?—I think not.

55,258. What is the length of your beam?—About 44 feet.

55,259. Would it be a disadvantage to be prohibited from using a beam more than 38 feet?—We could not catch as many fish.

55,260. Give me your reasons for that?—Well, you see that in the larger vessels they like to have larger beams. If we do not have gear according to the size of the vessels, they would swim the nets and run away with them, and we could not keep them at the bottom.

55,261. Could you not provide against that by using heavier trawl-irons?—If we had heavier irons we should require steam to get them up.

55,262. Then it would be a disadvantage to you not to be allowed to use a beam of greater length than 38 feet?—Yes, I think some of us would have to give the fishing up.

55,263. Did you ever hear of a law to the effect that you were not allowed to use a beam longer than 38 feet?—I have heard it spoken of.

55,264. Does anybody look after your trawl-nets, beams, and gear?—Yes.

55,265. Who does that?—The Coastguard.

55,266. Do they look at the mesh of your net?—Yes.

55,267. What is the size of the mesh of your net?—In some parts it is four inches I think.

55,268. Is that measuring the length?—Between the knots.

55,269. What is the smallest size?—The bag of the net is about $2\frac{1}{2}$ or 3 inches.

55,270. Not less than that?—No.

55,271. What is the weight of your trawl-irons?—Seven score and ten pounds and from that to eight score.

55,272. Do you weight the foot rope?—Yes, we put a weight on it. For the bigger boats we are obliged to have larger and thicker ropes.

55,273. And more weight upon them?—Yes, we like to have more weight upon the larger ropes, or they would swim the net.

55,274. What is the weight you put upon the foot rope?—It will be a hundredweight and a quarter, and about a hundredweight of rope is put on it afterwards; that will make it about two hundredweight altogether, and I should say it weighs more than that when it gets the wet and the slush on it.

55,275. (*Mr. Caird.*) Then there is the weight of the fish?—Yes, and the rubbish and the dirt.

55,276. What will sometimes be the weight of the trawl when you heave it up?—It will weigh a ton sometimes.

55,277. (*Mr. Lefevre.*) Do you think it would be a disadvantage to the fishermen if they were prohibited

FLEETWOOD.
R. Leadbetter.
1 October 1864.

from weighting the rope with more than 110 pounds; what would you say if there was a regulation of that kind forbidding you to use more than 110 pounds weight?—I suppose we should be obliged to do so.

55,278. Would there be any advantage in having such a rule?—I think not.

55,279. Would it be a disadvantage to you?—Yes, I think it would be a disadvantage; it would stop us from getting our living.

55,280. Did you ever hear of such a law?—No.

55,281. Have you any share in a trawl yourself?—Yes.

55,282. Do you think that most of the fishermen have shares and own the boats here?—No, they have not all shares.

55,283. But are the boats mostly owned by fishermen?—Yes.

55,284. Have you made a good thing of it of late years; have they yielded a good return for your money?—We have just done in a middling way, but we have had some very rough winters lately. It has not been so very good, but it has been rather rougher than common.

55,285. Then you have not done so well for the last two or three years?—It has been rough enough in the summer time; but in the winter time we have had so much rough weather that we have not done quite so well.

55,286. Then it is not from any scarcity that you have not taken so much fish, but because the weather has not been favourable?—Yes; generally there has been plenty of fish when there has been weather for us to work.

55,287. Where do you catch the codfish that you spoke of?—We catch them half way between here and the Isle of Man, generally west out from Blackcombe, about 20 miles out.

55,288. Have they herrings in them?—I don't think they have.

55,289. Do they not feed on the herrings at that time?—I don't think they do.

55,290. Have you looked at their bellies to see?—I have caught hake with herrings in their bellies.

55,291. But not codfish?—No, but I have found them with whiting in their bellies.

55,292. (*Mr. Caird.*) How far north have you trawled?—Never further north than the Point of Ayre.

55,293. Do you trawl off Whitehaven?—Yes, about west-north-west from Whitehaven, and off as far as Workington.

55,294. Never up the Solway at all?—No.

55,295. Nor into Wigton or Luce Bay?—No. I have been in Whitehaven. I have been there for shelter.

55,296. Have you any means of keeping your fish alive in wells?—No.

55,297. Is that never done by the trawl-vessels here?—No.

55,298. They are all sent dead to the market?—Yes. Sometimes in the winter they are kept alive for three or four days.

55,299. Out of the water?—Yes; plaice, fluke, and conger.

55,300. (*Mr. Lefevre.*) Do you fish off the Welsh coast?—Never very near the Welsh coast. Liverpool boats go there; but I never go within 20 or 30 miles of the Welsh coast.

55,301. (*Mr. Caird.*) Do you know if anybody here has ever tried the plan of well-smacks for keeping the cod alive?—No, we never get that quantity of cod to make it worth while.

55,302. The cod are not got in sufficient quantity to make it an object?—Not with trawling.

55,303. Nor with the long-line fishing?—There is a great quantity caught by the long-line fishing by the Manx men.

55,304. Did they ever try that plan?—I don't think they ever did, but I cannot say.

55,305. (*Mr. Lefevre.*) Do you ever take ice on board your trawlers?—No.

55,306. What do you do in the summer?—We send the fish in every day.

55,307. In a vessel from the fleet?—Sometimes we have five or six in a fleet, and one will come home and bring the fish from the others; but we are hardly ever all fishing in one place.

55,308. You are generally fishing in the summer in companies?—Some may be 20 miles from the others; but if there be two lots of fishing boats, two boats will come home. We send one from each lot, and if there are three lots, then three boats will come home.

55,309. In the winter do you keep the fish until you come in?—Yes; we generally come in on the Friday. Sometimes we come in in the middle of the week, and go back again.

55,310. You do not require a carrier in the winter?—We do send sometimes if the weather is settled, but generally it is not fit for us to send our boats from one to another, so as to get the fish on board.

55,311. (*Mr. Caird.*) Do you generally get your fish sent fresh to the market?—Yes.

55,312. Do you lose any?—Not often; we may upon a chance time.

55,313. It does sometimes occur?—It may occur sometimes. You know that in fishing it may happen that the vessel may not get in, but I don't know that ever I have had any fish spoilt that was not fit for the market in my life.

55,314. Have you ever seen large quantities of small unsaleable fish brought in by the trawl-nets?—No; we never got any fish but what people are accustomed to eat, and that were not fit for meat.

55,315. You never throw any small ones overboard that are not fit for the market?—Our mesh does not take any that are not fit for the market.

55,316. All you catch are fit for the market?—Yes.

55,317. (*Mr. Lefevre.*) Has there been a bad market for the coarser kind of fish during the cotton famine?—Yes.

55,318. Has it told on the fishing interests here?—Yes; it has been a bad job for the trawl fishermen. The rough fish have sold very badly.

55,319. There has not been a good demand for it?—No.

55,320. Have you got a better price for the other fish, such as soles and turbot?—Yes, they have been as good as ever they were.

55,321. Are the men on board the trawlers paid by share?—Yes.

55,322. Would you say that a law prohibiting trawlers from going within three miles of the herring-boats, would be disadvantageous to you?—That would just depend upon where the herring-boats would go, and if they could go where we were fishing.

55,323. When you are fishing off the Isle of Man, do not the herring-boats fish a great distance from land?—Now they do, but we are not fishing on that ground now.

55,324. Are you fishing anywhere near the herring fleet off the Isle of Man?—No, I never was. I never saw the Manx fleet fishing.

55,325. Are you never so near the herring fleet as to interfere with their tackle, or they with yours?—No.

The witness withdrew.

JOHN GIBSON called and examined.

55,326. (*Mr. Caird.*) You are agent for Lloyd's and have been a shipbuilder here?—I am; I am a shipwright's surveyor for the Board of Trade for this district, and a shipbuilder.

55,327. Have you built many of the trawl-boats that are used on this coast?—I built five of them.

55,328. Have you been building them of a larger size than they used to be some years ago?—Yes, rather larger.

55,329. What may be the cost of one of those vessels of the best class ready fitted for sea?—About 1,000*l.*

55,330. Does that include the vessel, trawl-net, and everything?—Yes, everything; that is the cost of the largest.

55,331. Is it within your knowledge that the fishermen themselves are proprietors of vessels of that character?—Most of them are.

55,332. I suppose that the money with which they have bought those vessels has been made by fishing?—I do not know that; that I think is a question. I believe that there is a good deal of borrowed money among them.

55,333. Are the boats to some extent mortgaged?—I think they are obliged to their friends in a great measure.

55,334. Have their friends a share in the boat?—Yes.

55,335. So that they have other money invested in the boats?—Yes, and they work it off generally.

55,336. The fishermen pay it off by degrees?—Yes.

55,337. And accumulate capital to that amount?—Yes.

55,338. Purely by fishing?—Yes.

55,339. Then the fishing on the whole is a prosperous business here?—To fishermen only. I never knew anybody else make any money by it, except the fishermen.

55,340. (*Mr. Lefevre.*) Were there two companies established here?—Yes, one lost 3,500*l.*, and the other lost 2,000*l.*

55,341. How many trawlers had they?—Six or seven; I got most of the boats for them.

55,342. (*Mr. Caird.*) You say that when the fishermen themselves attend to the business, they can make money by it?—Yes, but nobody else can.

55,343. (*Mr. Lefevre.*) After the break up of those companies, the trawlers fell into the hands of the fishermen?—Yes, they sold them at a low price, and the fishermen got supplied with cheap boats.

55,344. (*Mr. Caird.*) Are the fishermen doing well with those boats which failed when they were owned by a company?—Yes.

55,345. It is a business that requires attention by a practical man?—Yes, and it requires a deal of hard work.

55,346. And men simply having money in it, would not bestow that care and attention that are necessary?—Yes, the main thing is to take care of the gear; it is a great expense to keep a vessel going.

55,347. On the whole is the supply of fish at this port increasing from the trawl business?—Yes.

55,348. It shows no sign of falling off?—No; there are a great number more boats and more fish coming to the harbour than did formerly.

55,349. Is there no sign of the trawling which has been carried on for so many years in the channel, and between the Isle of Man and Liverpool, declining in the yield of fish?—I think it is increasing, there are larger boats and they get more fish than the small boats used to get; I believe that more fish has been brought into the harbour on that account.

55,350. Except the haddock, all kinds of fish seem to retain their abundance?—Yes.

55,351. Soles are not declining in quantity?—No, I think they are increasing; but a haddock is like a bird of passage, it is the same as the herring.

55,352. Have you ever heard any complaint by the line fishermen, of injury done to their business by trawling?—Never.

55,353. Are there any line fishermen in this place?—No.

55,354. The whole of the fishing is done by trawling?—Yes, I think there are a few line fishermen at the Isle of Man, and a few off Blackpool; but there are not many now.

55,355. The shrimp-fishing is not a matter of much importance here?—Not at Fleetwood.

55,356. Nor the mussel-fishing?—There are a deal of mussels got in the channel.

55,357. The channel of the river?—Yes.

55,358. Does it bring in much money to the parties engaged in it?—There are a few poor people who pick them up in the channel, boys and women.

55,359. Do they make a good living by it?—I do not know that they do.

55,360. Do they pick them up in the water or upon the rocks?—In both ways.

55,361. They do not ever fish these banks?—No.

55,362. There are always plenty of mussels?—Yes.

55,363. There is no demand for mussels for bait here I believe?—No, there is so little line-fishing.

55,364. (*Mr. Lefevre.*) Have you yourself built some trawlers for the fishermen?—I have built five.

55,365. Have you advanced money to the trawlers, in the prospect of being repaid by the fishermen?—Yes, I have trusted them a good bit sometimes in that way.

55,366. Do you know why it is, that the trawlers seem to have left Southport for Fleetwood?—On account of the carriage of the fish, they had to cart all the fish to Manchester by horse and cart, and it got bad.

55,367. As soon as the railway was made here, they found it a more convenient port for sending from?—Yes, that was the reason.

55,368. Do you send all your fish to Liverpool?—No; to Manchester, Birmingham, and London, and Edinburgh.

55,369. Is there any officer, on the part of the Government, who looks after the trawlers to see that they are all numbered?—Yes, the Coastguard see that they are all numbered about here, but they are not as particular as they were at first when they came.

The witness withdrew.

GILBERT BALL called and examined.

G. Ball.

55,370. (*Mr. Caird.*) Are you a trawl fisherman?—Yes, I have been fishing on this coast.

55,371. Are you at present a trawl fisherman?—I have been mostly fishing about the river for the last 14 years.

55,372. What do you fish in the river?—I do not pretend to follow it the year round, sometimes I fish, sometimes I sail passengers; I do whatever I can make most by. I am mostly about the place, and I make now and then a trial.

55,373. What sort of fish do you catch?—Flukes, soles, and codlings.

55,374. With a net?—Yes; sometimes with a line, but very seldom.

55,375. Do you get many soles?—Only very few at the back end of the year, and only a few at any other time. Sometimes they are not to be got at all here.

55,376. Were they formerly plentiful here?—About 14 years ago I could hardly keep myself and my wife, now I have eight in a family and I do very well.

55,377. Then the business is improving?—I got more fish last year than I have got for 14 years.

55,378. Of every kind?—Of flukes generally; I have seldom anything else.

55,379. Were there no codlings?—Yes, a few.

55,380. Have you a small trawl-net?—Yes.

FLEETWOOD.

G. Ball.

1 October 1864.

55,381. Do you trawl it up and down in the shallow water?—Yes, in the river.

55,382. In what depth of water?—Sometimes 30 fathoms, and from that to 10.

55,383. In all seasons of the year?—Yes; now and then I have had spells of it, but it has fallen off sometimes, and then if there is anything else to do I take to that. In general I have done very well for the last four or five years.

55,384. Are there more men engaged in that business than you?—Nobody can make it pay but myself and I can just manage it. Some have tried it but were not able to manage it.

55,385. Then you have it all to yourself?—They cannot get enough to suit them, and then they knock off. Somehow or other they cannot get as much as I do.

The witness withdrew.

J. Bagot.

JOHN BAGOT called and examined.

55,386. (*Mr. Caird.*) You set nets in-shore I believe?—Yes.

55,387. What is the shape and size, and how are they set?—I set some, in which I catch fish, in what we call a bag net; in other places I run a lot of nets across a hollow, and the fish are left in the nets when the tide runs out; as soon as the tide has gone out I go down to the nets, and see if there are any fish in them.

55,388. What length will they be?—I have had them of all lengths, from 20 yards up to 200 yards in my time.

55,389. What is the length of which you usually set them now?—I have them 200 yards.

55,390. In one net?—Yes.

55,391. How do you fasten each end of the net?—To stakes.

55,392. At each end?—No, I have a post set up at every three or four yards.

55,393. What is the depth of the net?—Three feet six, or four feet.

55,394. What is the size of the mesh?—From $2\frac{1}{2}$ to three inches.

55,395. Is there a poke in it?—Yes, in some, like in a trawl-net; it is a particular place for the fish to run into.

55,396. Are the nets so placed as to catch the fish coming up or going down?—They catch them coming down, but I have nets which catch them either going up or down.

55,397. Which answers best?—It depends on how I set them.

55,398. Have you caught salmon in them?—Yes, I have caught salmon in all nets; I have caught them in shrimp nets.

55,399. What is the fish you generally get?—Fluke and codlings.

55,400. Do you get any sperlings?—No, I have only got one or two for these 25 years.

55,401. Is the quantity of fish you can catch in that kind of fishing increasing or falling off?—Two, three, or four years since I could get a hundred-weight where I cannot get above five pounds now, with the same quantity of tackle.

55,402. Then it is much falling off?—Yes.

55,403. Is that because there are more people fishing, or because there are fewer fish in the river?—There are fewer fish in the river, and there are not as many fishing; 24 years ago some people at Preesall got as many flukes and codling as they could carry, and now there is scarcely such a thing to be got. One old man, who has been a fisherman for 40 years, has two nets of 20 yards each, and he can only catch about eight flukes in them.

55,404. In the two nets?—Yes, and 20 years ago he would have had eight score weight in them.

55,405. Is it the same with yourself?—No.

55,406. You do not make as much by it?—No, but I turn myself in other ways, I pick mussels; I send away more mussels from this river than any other person.

55,407. Do you make a good living by it?—I have no occasion to grumble.

55,408. What do you sell mussels at per bag?—At different prices, according to the quality.

55,409. What are the different prices?—From 2*s.* to 5*s.*, and I have sold them as high as 6*s.*

55,410. Does it depend on the market?—No.

55,411. Does not the price increase as the season goes on?—We generally fix a price about Michaelmas, and we keep our word so that that price lasts the whole season; we charge so much for getting the mussels, and so much per bag when we send them off.

55,412. Where do you chiefly send them to?—Bolton, Bury, Manchester, Oldham, Sheffield, and other parts of Yorkshire.

55,413. Is there a large quantity of mussels sent away from here on the whole?—I have sent 100 bags off in a week with 80 quarts in each bag; I am now doing about 50 bags per week.

55,414. Are there many more people engaged in the business besides yourself?—There are not very many, only a few.

55,415. How many mussels are sent away altogether in a week?—I should say 70 bags at this time will be as many as are sent away altogether.

55,416. Will that continue throughout the whole season of the mussel-fishing?—There is every appearance of it, and as the winter sets in there will be more gatherers, and more will be sent off.

55,417. The mussel beds are not beginning to fall off at all?—They are in some places, but in the summer time we go down below where the mussels are not worth anything, and bring boatloads of them up, and store them, so as to make a provision for the winter; but the law will not protect us if other people come and take them away. If there was a law, people would go and take them, and bring them very largely up the river, where they would feed themselves full.

55,418. Do they feed well?—Yes, they are fine fish, fit to go to London or anywhere else, but we want a law to protect every man who lays them down and makes a provision for the winter.

55,419. Does anybody go and take fish which other people have laid on beds for the purpose of feeding?—Twenty-five years ago, when I came first, they said that after the tide had been over them, they belonged to anybody. I went to a gentleman named Bowling of Liverpool, who was the owner of property here, and he said that if I sent for a cargo of stones and dropped them over the side of the vessel, they would be anybody's after the tide had been over them; he said, lay them down and put them where there are none, and if any person molests them then write to me. I have practised that, and it has been one means by which I have got my living; some people occasionally go there for a quart or two, and I do not object to that so long as they do not take them in bags to the market.

55,420. Practically the people do not interfere with you?—No, but they say they could do so.

55,421. Do many other people practise the same system of carrying mussels from the lower part to a better feeding ground?—Yes, a few.

55,422. And do they find the same advantage from it?—Yes.

55,423. (*Mr. Lefevre.*) What kind of ground do you lay them upon?—There is a run of fresh water where they are laid down.

55,424. Is it clay?—It is marl underneath, and it is covered with gravel; they want stones to adhere to.

55,425-6. Have you marked out your own portion of ground, where you lay down your own pick?—No, but we all know our own.

55,427. You lay them down where there are no other mussels?—Yes.

55,428. You think you ought to have some property

in the soil?—Yes, it would be a great benefit to all poor people if we had.

55,429. We have been told that oysters have been laid down in the bay here; have they been laid down on the same kind of ground?—Yes, and I think they ought to be protected; when we lay the mussels down on our ground and protect them, they become the finest fish that ever went into the market; when they are in season they have filled themselves double over.

55,430. Do you think it would be of great advantage if some kind of power were given with regard to the laying down of oysters?—I do.

55,431. And to give a property in the oysters when they are laid down?—Yes, it would be an encouragement to those that are industrious, and it would be a great kindness to all the poor people here, to everyone who is engaged in the business.

55,432. Is there anybody who claims the soil of the bay for the purpose of laying down oysters?—There are gentlemen who claim the manorial rights, and who have objected.

55,433–4. Is the ground uncovered at every tide or only at spring-tides?—They are better where it is only uncovered at spring-tides; it ebbs further out, and the lower down we can get our mussels the better they are, because they are not much exposed to the sun.

55,435. Would oysters and mussels breed there, if you could lay them down for that purpose?—I have sent for them from Ireland and tried them; I think those oysters which the trawl-boats have thrown out are inclined to breed, because I have found hundreds of little ones adhering to the stones.

55,436. How do you account for the decrease in the quantity of the flounders or flukes?—I am afraid to speak what I think about it.

55,437. You may say what you like here.—One should be careful what one says. I believe that shrimping is the worst thing that ever was begun. They were never intended for food for man. Anybody can see that they were only intended for food for fish.

55,438. Are there many shrimpers from this place?—There are a few. I have followed it myself.

55,439. How many are there?—Not many.

55,440. Then it is not the shrimpers here who do harm to the fluke-fishing?—No, not in this bay; but they do harm wherever they are.

55,441. Are you referring to the shrimpers in Morecambe Bay?—Yes.

55,442. What harm do they do?—They kill all the young fry. When I was a boy my grandfather has told me about being able to get more fish than his boat could hold; but that is not the case now.

55,443. Do you suppose that more than eight or 10 make a livelihood out of the flounder-fishing here?—At one time there was no market nearer than Preston.

55,444. What is the greatest number of men you have seen employed in catching flounders here?—At the time it first set in, there were in the village of Preesall about 10 or 12 men; now there is not one.

55,445. What could be done in order to prevent shrimpers from destroying the young fish?—You should do the same with them as you have done by the Salmon Act with the salmon fishermen, namely, knock them off altogether, but not so suddenly. If you were to throw it over all at once, you would throw 100*l.* worth of nets on the hands of some of the fishermen that would not be worth a penny. I think there never was so an unjust a thing as that in England, and yet that has been done by the Salmon Act.

55,446. I do not want to go into the question of salmon; you would not deal as unjustly by the shrimpers, as you think has been done by other fishermen under the Salmon Act?—No; not without giving them compensation.

55,447-8. But you would stop their trade altogether?—Yes; because it is not a benefit to anyone. Shrimps were never intended for food. Anybody can see that. What man could fill his belly with shrimps? It is a ridiculous thing to suppose they were ever intended for food. Only look at them.

55,449. But what number of men would you be taking from this trade?—It is a weighty matter and a serious job I know.

55,450. Would it not do a great deal more harm to destroy the shrimp trade than the flounder trade?—Yes; but had you not better do a present harm, than wait until they are all killed.

55,451. Which brings in the most money, the shrimping or the flounder taking in Morecambe Bay?—I do not know; but only look at the ova destroyed. Thousands and thousands of the young fry of soles and turbot are entirely destroyed, and then make a calculation of what they would bring in, if they were allowed to grow up. It is not alone what the shrimps bring in; but when you have butcher's meat at 9*d.* and 10*d.* a pound, I think it is a great objection to destroy all this young fry.

55,452. You think they do damage not only to the flounder-fishing, but also to the sole and turbot?—They do damage to all the young fry that come upon the shore.

55,453. Do they not do any damage to the deep-sea fishery, do you think?—I have heard many tales about that, but I am not a witness upon that point. I am not condemning them at all.

55,454. Do you think that the decrease in the flounders has had any reference to the mussels which have been found on the banks?—Wherever there is a strike of mussels they will come from a long distance to that strike, that is when the mussels are about the size of coffee-beans. They crack them and eat them, and they are attracted there from places all round.

55,455. Then do you think the disappearance of the flounders is due to there not being so many mussels?—Yes; they feed upon any crustacea at the bottoms of the rivers. Trawling in four feet of water is a very bad thing I think.

55,456. Does it take the mussels away?—No; but it destroys all the food the fish feed upon.

55,457. Do you not think that the disappearance of the flounders may be due to that, rather than to shrimping?—No; it is shrimping that causes it. I have seen so much of it.

55,458. (*Mr. Caird.*) Do you mean that the shrimping causes the disappearance of those small fish upon which other fish feed?—No; it is the shrimping that kills the young fry, and prevents them from coming to maturity.

55,459. Do you mean trawling for shrimps?—Trawling on the edges of the banks and putting a net before them in shallow water only 10 inches deep.

55,460. You say that the crustacea are being destroyed by trawling?—Yes, trawling in the beds of rivers; but shrimping destroys most young fish on the edges of the banks in shallow water.

55,461. (*Mr. Lefevre.*) Have you, when the tide goes out in the summer, seen a large number of the fry of fish of all kinds destroyed by the sun and the heat?—I have seen it sometimes on the sands.

55,462. Do you not think that there is a great destruction of fish in that way?—The Almighty who made them has made an allowance for that; there would be plenty and to spare for food for all our families, if they were not unhappily destroyed.

55,463. There is a vast destruction in that way?—Yes, plenty; but I think there is an allowance for waste of that sort.

55,464. There is a vast destruction in that way?—Yes, there is.

The witness withdrew.

FLEETWOOD.

J. Carter.

1 October 1864.

JOHN CARTER called and examined.

55,465. (*Mr. Caird.*) You are the superintendent of the goods department of the railway at Fleetwood?—Yes.

55,466. You put in a statement now of the number of packages and the weight of the fish forwarded from Fleetwood from January 1863 until August 1864?—Yes, it is as follows:—

Months.	Packages.	Weight.			
		Tons.	cwt.	qrs.	lbs.
1863.					
January	1,376	47	9	3	4
February	2,190	75	3	2	0
March	2,258	76	12	1	7
April	2,252	75	0	0	26
May	2,958	88	13	2	18
June	1,884	56	11	2	27
July	2,073	56	17	3	14
August	2,060	59	12	3	10
September	2,380	101	4	3	14
October	2,525	101	3	0	20
November	1,716	65	19	0	24
December	818	32	13	2	1
Total for the Year	24,490	837	2	2	25
1864.					
January	814	33	18	0	20
February	1,379	54	5	1	18
March	1,973	70	19	0	8
April	1,860	69	12	3	11
May	2,555	81	19	2	26
June	2,282	77	10	2	1
July	2,280	79	13	0	12
August	1,459	61	6	3	10
Total for eight months	14,602	529	5	2	22

The witness withdrew.

J. Cumpstey.

JOHN CUMPSTEY called and examined.

55,467. (*Mr. Caird.*) You are a fish buyer here?—Yes.

55,468. Have you been long in that business?—Six or seven years.

55,469. Do you buy all kinds of fish that are caught, both by the trawlers and the river fishermen here?—No, only that caught by the trawlers, and the herrings when they come.

55,470. During that period of time, can you tell us if the fish brought to this market have been increasing or diminishing?—I think on the whole they have been increasing.

55,471. Is there any particular kind of fish which has increased more than another?—If anything it has been soles.

55,472. Are they both greater in quantity and finer in quality, or is the quality much about the same?—The quality is much about the same.

55,473. There is no deficiency in quantity?—No, none whatever.

55,474. Are there many codfish brought here?—There is a pretty fair supply in the spring of the year.

55,475. Does it continue to be quite as abundant as it formerly was?—Yes, it is quite as plentiful.

55,476. And turbot?—Turbot and brill as well, and red gurnard.

55,477. Has the supply of the coarser quality of fish increased or diminished of recent years?—I cannot see that there has been any difference in that respect.

55,478. Has there been a great difference since the commencement of the cotton famine in the relative prices of the coarser qualities, as compared with those on the finer?—They have not been worth half what they were before.

55,479. What are the fish you call the coarse fish?—Such as plaice, flukes, garvies, dabs, grey gurnards, ray, and skate.

55,480. They have fallen off more than half in consequence of the cotton famine?—Yes.

55,481. But all other kinds of fish have maintained their price?—Yes; prime fish has maintained its price.

55,482. Is the proportion of coarser and finer fish about equal?—The finer fish make the most money.

55,483. But how is it with regard to the quantity?—I think there are more of the coarser fish than the prime.

55,484. (*Mr. Lefevre*). But the finer quality of fish on the whole brings in more money to the fishermen?—Yes, I am sure it does.

55,485. Have you observed what time of the year the soles are spawning that are brought here?—No, I cannot say that I have. We have the largest quantity of soles in May.

55,486. What condition are they in then?—They are in good condition.

55,487. Are they full of spawn then?—Yes, they have spawn in them.

55,488. In June and July do you find that you get spent fish?—I have not noticed that.

55,489. You cannot say, then, what time the soles spawn?—No.

55,490. Have you sold haddocks since you have been selling for the trawlers?—No.

55,491. Have you sold herrings for the fishermen?—We buy them generally. There is no regular market. We buy them and send them away.

55,492. Did the trawlers generally give up trawling for the purpose of going to the herring-fishing?—Some few of them, but not many.

55,493. Some went on trawling notwithstanding?—Yes. There are generally plenty of trawl fishermen when there are herrings.

55,494. Do they fish near the ground where the herring fishermen are at work?—No, I do not think they do.

55,495. (*Mr. Caird.*) Were the herrings at any time a very large fishery here?—Yes, about three years ago there was a great quantity.

55,496. Have you any idea how many barrels of herrings would be taken here?—I have seen as many as 10 waggons go away from here that had been caught in one tide.

55,497. Railway waggons?—Yes.

55,498. How many tons would that be?—Each waggon would carry about four tons.

55,499. That would be about 40 tons of fish?—Yes.

55,500. Would that continue for some time?—No.

55,501. It was a very good fishing?—Yes.

55,502. There has been nothing of the kind for the last three years?—No.

The witness withdrew.

JOHN MAY JAMESON called and examined.

55,503. (*Mr. Lefevre.*) We understand that you have recently bought a cargo of oysters, and have laid them down in the bay here?—Yes, and I am expecting a third cargo.

55,504. Have you already brought two cargoes here and laid them down?—Yes, and I am expecting a third.

55,505. How long have they been laid down?—The first about a month, and the other yesterday.

55,506. Have they been laid far up the river or at the entrance of it?—They are laid down about a mile from the shore, towards the lighthouse.

55,507. On what kind of ground?—On clean shingley ground.

55,508. With marl underneath it?—Clay, I believe.

55,509. Is there fresh water over it?—It is brackish water out of the Wyre.

55,510. Are there any mussels there?—No, we avoid the mussel beds.

55,511. Is there much ground in the bay here fit for laying down oysters?—We should be able, I think, to lay down about 3,000 or 4,000 barrels.

55,512. On that piece of ground?—Yes, about that place.

55,513. Are there many other places of the same kind in the bay?—No, I have tried several places, and that is the only place where I find them keep from being covered with sand. I have tried several places and they all silt up with sand except this.

55,514. Have you obtained leave from the Crown or any person?—Yes, leave was obtained from the Board of Trade and from the lords of the manor.

55,515. You have reason to believe that you have acquired sufficient property in the land to enable you to lay them down with security?—Yes, we have a copy of the Act of Parliament given to us by the solicitors of the Board of Trade.

55,516. What Act of Parliament?—It is an Act protecting oyster fisheries three miles from the shore.

55,517. Is it within three miles of the shore?—Yes. We have acquired this bay from Fleetwood as far as the land mark from the shore.

55,518. (*Mr. Caird.*) Is it a local Act?—I have it in the office, but I will send for it if you wish.

55,519. (*Mr. Lefevre.*) Is the ground uncovered at ordinary tides?—Some of it is never uncovered.

55,520. Is it fit for the breeding of oysters?—I think so.

55,521. Do you intend to try the experiment?—We have been trying the experiment in several ways; we have tried it in a variety of ways, and not altogether I think without success.

55,522. Have you ascertained whether you would have property in the oysters bred there?—I think so, but we intend to import as many as we can of them.

55,523. What is the size of this piece of ground, is it some acres in extent?—About four or five acres.

55,524. But with that exception, you think there is not much ground in the bay fit for the same purpose?—There is not much that is ever dry. There may be some ground that I have never seen.

55,525. In other parts you find that the sand covers and would choke the oysters?—Yes, we have tried half a dozen places.

55,526. Would they not do where the mussels are found?—No, the mussels kill them.

55,527. Could you not clear away the mussels and lay down the oysters, the oysters being a more valuable crop than the mussels?—Yes, but mussels generally accumulate where it is too dry for the oysters. If we put oysters out on the dry ground a great deal exposed to the sun, they will not fatten and improve.

55,528. But a great many of the mussel-beds are in the same condition between high and low water?—Yes, but the mussels get up on the top of the high pinnacles in the sea or in the channel.

55,529–30. (*Mr. Caird.*) Have you any enclosure of any kind round your oyster bed?—We have buoys.

55,531. Do you expect to make a profit by feeding them there and making them better for the market?—We do expect to make a profit; but our great object in bringing them here is to try and make a business in Fleetwood. We are very dull at present, and we are trying to get up some work for the poor; if we are enabled to do that we shall not grumble about it whatever the profit may be.

55,532. Your object is to ascertain whether oysters will breed there and form a regular oyster-bed?—Yes, and if we can employ some of the poor men upon the ground we should be content with a very small dividend.

55,533. Taking the ordinary influence of profit on men who engage in trade of that kind—do you anticipate such a profit upon them by the improvement which the oysters themselves will undergo in these waters, as compared with their condition when they are brought here, as will pay for the expense of keeping the beds up?—Yes, we expect it will do that and well too.

55,534. They have been brought from Arklow, have they not?—Yes.

55,535. What do you pay for them at Arklow?—Six shillings a barrel.

55,536. How many in a barrel?—From 800 to 1,000.

55,537. Are they a large or small description of oyster?—They are the native oysters such as those which are sent to Whitstable.

55,538. The oysters that are eaten in London as natives?—Yes, they bring them from Arklow and lay them down in the Thames.

55,539. When they are brought here are they in a poor condition?—Yes.

55,540. Do you find that they fatten and become like the natives of the London market?—Yes, but we can never get them here with the same flavor, because we have not such a rich water as they have in the Thames.

55,541. But they become superior?—Yes.

55,542. What do you sell them for after they are laid upon the banks?—I have never sold them. They have only been six weeks laid down.

55,543. What would well-fed oysters such as those bring in the Lancashire markets?—I have been told that they will bring about eightpence a score.

55,544. That would be a very large profit?—Yes, but we do not calculate upon getting more than half of them alive.

55,545. (*Mr. Lefevre.*) What is the average size of the oyster?—From one and a half to two inches.

55,546. Are there a great many under two inches?—No, I should think that two inches is about the average. We would prefer them smaller if we could get them, because we should then have more in the barrel.

55,547. Are they all sorted and the larger ones taken out?—No, we get them as they are taken out of the dredges.

55,548. You would expect a larger profit on smaller oysters?—Yes, there would be more of them; but many of the smaller ones would die because they have not strength to bear the voyage. In the first cargo we had here they got some of the bilge water in among them, and that killed a great many.

55,549. That was an accident, I suppose?—No, there is always a great loss.

55,550. Particularly among the smaller oysters?—Yes.

55,551. What are the smallest oysters that would be profitable to lay down?—Oysters the size of a shilling; they would do for next year.

55,552. If you were prohibited from buying oysters at Arklow less than two inches, could you then buy them to lay down at a profit?—I do not think we could.

55,553. Would that do away with the trade?—It would do away with the trade at Arklow, because they would have to sort the oysters.

FLEETWOOD.

J. M. Jameson.

1 October 1864.

55,554. By the time they reach this place would they be of such a size that it would not be worth while to lay them down for the purpose of growing to a larger size ?—Yes.

55,555. Suppose you were not allowed to buy oysters less than 2½ inches across, would it be worth while to buy larger oysters for the purpose of laying them down ?—Yes.

The witness withdrew.

J. Turner.

JAMES TURNER re-called and examined.

55,556. (*Mr. Lefevre.*) Can you tell us what the average earnings of the herring-boats would be ?—The average earnings of the herring-boats for a season lasting for 10 weeks would be about 100*l.* for each boat.

55,557. You had two very successful seasons some time ago ?—Yes.

55,558. And since then you have had none ?—No.

55,559. (*Mr. Caird.*) Is there any reason you can discover for the fish having kept out of your bay since ?—No.

55,560. Has it been the case as far as you remember that they come occasionally, and then that they do not come ?—Yes, they have been away for 10 years sometimes.

55,561. (*Mr. Lefevre.*) Have you seen the trawlers trawling near you ?—Not very near.

55,562. They never did you any damage ?—No, except once.

55,563. Do you attribute the disappearance of the herrings to the trawling in any way ?—Not at all.

55,564. You do not think that the trawling has frightened away the fish ?—Not a bit. There have been successful seasons off the Isle of Man, but they have not come as far as here.

55,565. What distance do your boats go after the herrings ?—They go from here to the Isle of Man after them, but I never got any myself further than six miles from the coast.

55,566. Have you reason to believe that the herrings are off the coast somewhere, but not in sufficient numbers ?—I believe so from looking at the birds sometimes. There are a great quantity of them off here at the present time, and there may be a few herrings in the bay.

55,567. Have you known the herrings to be off the bay when the drift-net fishermen could not catch them ?—Yes, once or twice. I have known them to go to the bottom of the Lune ; but you would only run the risk of tearing your nets in going after them, although if you had your nets down, you would be certain to get them.

55,568. Have you known them on the surface when the drift-net men shot their nets and could not take any of them ?—No.

55,569. What is the depth of the river here ?—Twenty-two feet.

55,570. Do you sink the nets any depth ?—Yes, we weight them at the bottom and cork them at the top.

55,571. But do you sink them by ropes ?—Yes, according to the depth of the water. We put a net or two out to ascertain the depth, and then sink them in proportion.

55,572. But with the exception of the fish being at the bottom have you ever known the fish there when the fishermen have not been able to catch them ?—No.

55,573. Do you know where the herrings spawn ?—No, but I have seen the spawn in the nets sometimes.

55,574. Have you found spent fish here ?—In the first take after they make their appearance one half of them are full fish and one half spent fish.

55,575. Then are you not fishing on the ground where they are spawning in fact ?—I do not know.

55,576. What is the nature of the bottom ?—Both sand and stones. There is a large extent of sand in one place, and then down at the edge of the river there are stones.

55,577. When herrings first come into the bay are they spent fish ?—No, half of them are full fish.

55,578. As the season goes out, are there more spent fish ?—Yes.

The witness withdrew, and the inquiry was adjourned until the 3d of October, at Liverpool.

Liverpool, Lancashire, Monday, 3d October 1864.

PRESENT :

J. CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

LIVERPOOL.

R. Isaac.

3 October 1864.

ROBERT ISAAC called and examined.

55,579. (*Mr. Caird.*) You are a fish dealer in Liverpool ?—Yes, and a smack owner.

55,580. And you have been for a number of years acquainted with the state of the supply of fish to this market ?—Yes, for upwards of 30 years.

55,581. What are the various kinds of fishing which are practised from Liverpool ?—Do you mean what do we trawl for ?

55,582. Yes.—Soles, turbot, brill, ray, flukes, gurnard, and everything that the trawlers catch on any other coast.

55,583. Have any of those varieties of fish shown signs of diminution within late years ?—The soles in the spring of the year have diminished, you may say, to a very great extent.

55,584. They have fallen off, have they ?—They have fallen off very much within the last ten years.

55,585. Is there any other kind of fish that has diminished, except soles, in the same marked manner ?—Haddocks have left the coast altogether. There are very few to be caught now ; but you may say that every kind of fish has diminished off this coast.

55,586. Every kind ?—Yes.

55,587. What do you attribute the falling off to ?—I attribute it to the shrimpers. They carry a trawl net along with them as well as a shrimp net, and they catch all kinds of fish. They catch stuff that is not fit to bring into the market, and then throw it away. Out of the whole quantity of soles that came to market last Saturday from these small boats, I should say that, out of a hundred pair, there would be 90 pair of small ones under a pound a pair.

55,588. Are they so small as to be unsaleable ?—Most of them are unsaleable,—at least, they sell them at some price or other ; but they are quite small fish, and bring very little money.

55,589. But they do go into consumption in the market ?—Yes ; but there are a great quantity thrown upon the beach, not fit to bring to market.

55,590. Have you yourself seen that ?—I have not seen them on the beach, but there are witnesses here who have done so. They commence about the middle of August, and are catching these small fry until the middle of October.

55,591. Is it at that time that the greatest injury

is done?—That is the only time when the injury is done; it is before the small fry can get into the deep water; they are feeding in the slush now.

55,592. From the middle of August until the middle of October?—Yes.

55,593. Do they go into deep water then?—Yes; and they grow rapidly into large soles, ready for the spring fishing.

55,594. Do you mean that we should understand that, if some stop is put to that system of fishing from the middle of August until the middle of October, it would result in the benefit of the fishing?—Yes, in the bays, but not in deep water. There they can fish and do no harm at all; they catch nothing but large soles there.

55,595. Are there no small soles caught in deep water?—Yes, sometimes; but we attribute it to our men having their mesh made so small.

55,596. What is the size of the mesh of the trawl net for deep water?—About $2\frac{1}{2}$ inches for the deep water.

55,597. Is that the smallest mesh in the net?—Yes, it is the smallest mesh in the net.

55,598. There is nothing smaller than that?—Our men are using smaller meshes, but I do not approve of it.

55,599. What is the size of the mesh they are using now?—About an inch and a half.

55,600. (*Mr. Lefevre.*) Is that from knot to knot, or pulled out?—From knot to knot.

55,601. (*Mr. Caird.*) Is that the smallest size that is used now?—Yes, by the large boats.

55,602. By the large boats, in deep water?—This (*producing a piece of net*) used to be the size of the old mesh, but now they have made it less than that.

55,603. (*Mr. Lefevre.*) Is that in the bag of the net?—That would let anything go through that would be unsalcable.

55,604. What size do you call that?—I think it is $2\frac{1}{2}$ inches.

55,605. That is, when it is pulled out?—Yes; but it has to be shrunk in by the water yet.

55,606. That would be $1\frac{1}{4}$ inches from knot to knot?—No; that is half a mesh.

55,607. The Act of Parliament says from knot to knot along the line?—Yes.

55,608. You say it is $2\frac{1}{2}$ inches when pulled out?—Yes.

55,609. That would be $1\frac{1}{4}$ from knot to knot?—Yes.

55,610. (*Mr. Caird.*) The Act says, $1\frac{3}{4}$ inches from knot to knot. That mesh you have there is below the legal size?—Yes, according to that measurement.

55,611. Is there no regulation fixed or enforced by anybody as to the size of the mesh of the net you use in trawling?—There is not round this coast.

55,612. Has nobody inspected the size of your mesh?—I never knew anyone do so.

55,613. Then any man is at liberty to use what mesh he pleases?—Yes.

55,614. And within late years they have begun to use smaller meshes?—Yes; for the last few years they have begun to make them smaller and smaller, in order to catch whitings in the spring, which is one of the worst things they can do.

55,615. Do you object to catching whiting?—No; but I object to catching them with small nets. They catch small fish and everything, without giving the fish a fair chance.

55,616. Have they reached a size now that enables them to catch a larger proportion of small fish than they did before?—Yes, exactly.

55,617. Do they bring them to the market?—Yes, in the spring of the year.

55,618. Are they saleable for food?—Yes, but they bring a low price; they are scarcely worth catching.

55,619. They go into consumption among the poorer classes?—Yes.

55,620. Is there a large proportion of the whole catch of that description?—Yes, of whiting in particular, and of small offal or rough fish.

55,621. Are the whiting that are caught now of a smaller size than used to be caught?—Yes, they are a good deal smaller; but they catch some of the large ones as well. The general run of the fish is a deal smaller owing to the size of the mesh, and I think the cause of that is the small boats from Southport and the shrimpers who engage in trawling, and in trawling too near the banks in shallow water.

55,622. Were you formerly in the habit of getting a supply of whiting from the trawl-boats?—We used to get very few. Thirty years ago we got a supply from Dublin Bay, when the old mail steamer came. I had a lot consigned to me by the mail boats from Kingstown.

55,623. Of whiting?—Yes, and they were the finest I ever had.

55,624. Where do you get them now?—Mostly from the east coast; but in the spring, off our own coast, we used to get an abundance of haddock; but we are catching very few now; they have left the coast, I think.

55,625. From whence does Liverpool derive its principal supply of fish?—From all parts. Now, since railways have been opened, fish are sent from Liverpool to all parts, and are received in Liverpool from all parts.

55,626. Do you get most by fishing boats, or most from the east coast by land?—We get a great deal from the east coast, but in the spring of the year we get most from our own boats. We get very few from other quarters when the fish are on our own coast.

55,627. Do your own boats afford you a sufficient supply to send inland, after supplying Liverpool?—Yes; we get a large quantity in certain months of the year.

55,628. Has that increased or diminished of late years,—I mean your power of sending away fish inland?—It has diminished for the last four or five years.

55,629. Is there a larger consumption of fish in Liverpool now than there used to be?—Yes.

55,630. Does it keep pace with the increase of population?—I think it does.

55,631. Would that account for the fact that you do not send as many inland?—Yes, because we have not got them to send, or else we should send away as many; but since the east coast fish can be procured so readily from Hull and other places near there, we find that they can meet us in Manchester and in the other markets.

55,632. You say that in certain months of the year you have a fair supply, and that you then supply the inland market. In what months is that the case?—Generally our best fishing is in April, May, and June. Those are the heaviest months of the fishing. Sometimes in March we have a very great fishing, if the weather is in any way favourable.

55,633. During those months, are you able to supply your own market, and spare some for the inland market?—Yes, tons weight go away in those months.

55,634. During those months, where do your fishing boats find their fish?—Some of them fish on the Cumberland coast, towards the Isle of Man, in deep water, and some go right to the other side of Carnarvon Bay. They spread themselves about; some go to the Scotch coast.

55,635. Has the supply of fish during those months in which you say you have the largest supply diminished of late years comparatively?—Yes, it has diminished a great deal.

55,636. But still you have more than you require for the market here?—Yes.

55,637. Have you ever been in the habit of getting large quantities of turbot?—Yes.

55,638. And cod?—We catch a few in the trawl now and then; but there are plenty of cod on the coast, towards Redwharf, but these boats do not go for them.

LIVERPOOL.

R. Isaac.

3 October 1864.

55,639. Is there no long-line fishing?—A little from Hoylake, Southport, Lytham, Blackpool, and round about the coast.

55,640. Where does the principal supply of cod come from?—We get the principal supply from this time until about the month of February from Dublin, and the east coast.

55,641. They are line-caught fish?—Yes; we get some also from the Isle of Man; they come on the banks there.

55,642. They are also line-caught fish?—Yes.

55,643. You get very few cod in the trawl, I suppose?—Very few; we may get half a dozen or so, but nothing of any consequence.

55,644. Do you yourself deal in shrimps?—No.

55,645. In shell-fish of any kind?—In oysters. We catch oysters in the trawl net. I do not deal in shell fish for retail purposes, but only for sauces.

55,646. Where do the shell-fish come from?—Considerable quantities come from Sligo.

55,647. Do they come direct from Sligo?—Yes, direct by steamer, twice a week.

55,648. Are there any oyster beds in the neighbourhood of Liverpool here, or round the coast?—Yes, there are at Beaumaris, where they lay down oysters in the spring of the year for consumption here.

55,649. For this market?—Yes.

55,650. Are there no oyster beds which produce oysters of themselves on this coast?—No; our trawlers catch a few now and then; they dredge for them in Carnarvon Bay.

55,651. Is there any large proportion of soles caught by the small boats which fish in the shallow water?—Yes, a great quantity at this time of the year.

55,652. Do those small boats or the large boats give the largest supply to Liverpool?—The small boats do not give any; it is only a small class of fish that they catch. The soles they get will only weigh about a pound a pair.

55,653. Is there a large supply of that fish just now?—In this month and September there has been a heavy fishing for them.

55,654. Has that been the case for many years?—Not many.

55,655. In September and October?—From the middle of August until the middle of October; but there is nothing but the spawn, except an odd sole left now.

55,656. Has the quantity of that description of small fish increased of late years?—There have been more caught this last month than were ever known before.

55,657. Has that mode of fishing been in existence for many years back?—Not for many years back, I think.

55,658. How long back, do you remember?—It is only of late years that these small soles have come to the market.

55,659. Has it not been practised for a long time by the fishermen of Hoylake, and about that quarter?—About 10, 12, or 15 years; but then they did it on a very small scale as compared with the scale upon which they are doing it now.

55,660. Have the boats employed in that fishing much increased lately?—Yes, and they have been made rather larger.

55,661. Have they increased in the length of their trawls?—Yes; they have a beam to their trawl now of 30 feet, where they formerly used short ones. They have a trawl for dredging, as well as for shrimping.

55,662. Do the same boats that trawl, also fish for shrimps?—Yes.

55,663. At a different time?—Yes.

55,664. (*Mr. Lefevre.*) How many of those boats are there?—Belonging to Liverpool and Hoylake?

55,665. Yes.—About 20 or 22, and there will be in Liverpool 40 of the small shrimping boats.

55,666. (*Mr. Caird.*) Which also use that description of trawl net?—Yes, but not so much in Liverpool as Hoylake.

55,667. (*Mr. Lefevre.*) Then there will be about 60 of those boats altogether?—Thereabouts.

55,668. (*Mr. Caird.*) What part of the coast do those boats fish?—All about the river, this side of the Bell Buoy.

55,669. To the entrance of the river?—Yes, where the fish get their food; that is where these young fry and the soles feed until they get strong enough to go into the deep water.

55,670. (*Mr. Lefevre.*) And up the estuary of the Dee, I suppose?—Yes, all round there.

55,671. And the Ribble?—Yes, right up the Ribble. The Southport men go there.

55,672. There are other vessels of the same class from Southport that fish up the Ribble?—Yes.

55,673. (*Mr. Caird.*) Do those boats that fish for sole turn their attention to shrimping?—Yes; they are shrimping regularly now, but they catch more prawns and shrimps in May than at any other time.

55,674. Do they fish on the same day for both shrimps and soles?—No, not generally.

55,675. You attribute the falling off, which you say has taken place in the supply of trawl-fish in deep water, chiefly to fishing in shallow water with a small mesh?—Yes.

55,676. And it is of a smaller mesh than it was the custom to fish with in deep water?—Yes.

55,677. Would it have any effect upon the supply to the market here, if a stop were put, during the three months you mention, to fishing with a small mesh in the shallow water?—Decidedly so. There would be double the quantity of fish next year, both in the summer months and in the spring of the year. A larger number of fish would have liberty to go to the deep water.

55,678. Then the fishermen who fish along the shore would not get any fish at all?—They would not catch any of those small fish.

55,679. They would have to turn their attention to something else?—They would always get plenty of employment. They could either go into the larger vessels, or use their boats as pleasure boats.

55,680. Would the market here suffer from the want of that supply which you say goes into consumption among the poorer classes?—No, it would be all the better for the poorer classes; the quantity in the course of 12 months would be doubled. Let them all have the same sized mesh and the fish would increase, I believe, year after year.

55,681. Then the remedy you would apply would be a regulation of the mesh and the stopping of this mode of fishing everywhere?—I would have a regulation with regard to the mesh, and I would stop all the smacks, both large and small, so as not to allow them to go within ten miles of the Bell Buoy.

55,682. Would it not be sufficient to make a regulation of the mesh, so that it should not be less than a prescribed size, and then allow the people to fish where they liked?—I think it would be better if there were a certain restriction, say ten miles from the Bell Buoy. You ought not to allow a net to be used within ten miles north of the Bell Buoy.

55,683. The effect of that would be to put a stop to the fishing by the poorer class of fishermen?—The small boats could go anywhere else.

55,684. The small boats could not go out in the deep water to trawl alongside your large vessels?—They could not go as far out. If they fish so near the banks they kill all the small fry on the banks. There will be no fish left soon for the deep-fishing, if these small boats increase.

55,685. But if the mesh is large enough, and the small fish can escape through it, and if a mesh of that kind was made compulsory, would not the evil you complain of be prevented?—Yes, most of it; but small fish are sometimes very weak, and upon a bank with shallow water, where there are only two or three fathoms of water, they catch such a quantity that the whole of them could not escape. It would be impos-

sible, because it is where they are feeding that the greatest quantity of fish is found.

55,686. Has the price of the fish altered much of late years?—No, I cannot say. Soles have been better of late years than they were before.

55,687. Has the cotton famine had any effect upon the price of what you call the rougher fish?—No, not any.

55,688. Have not fish of a coarser quality sold worse?—No; they have sold as well.

55,689. Have all kinds of fish?—Yes.

55,690. Do the poorer classes consume a large proportion of the fish brought to Liverpool?—Yes, a very large proportion indeed.

55,691. What sort of fish do they use?—The cheap fish, such as skate, small garvies, gurnards, and whiting. When we got such large quantities of whiting in the spring of the year, we sold them at reduced prices to the poor people. They gave so much a basket for them, and one or two poor women would buy a basket and divide them between them.

55,692. Have the whiting come in in greater quantities of recent years?—There have been very few this last year, but previously they were in greater quantity than was ever known in Liverpool; but that was owing to our own smacks having a smaller mesh than they ought to have.

55,693. But that was of advantage to the poorer people?—Yes, but they have had nothing for many years since.

55,694. You really think it has had the effect of stopping the supply?—Yes, I have no doubt of it.

55,695. That has shown itself, has it?—Yes, this year.

55,696. How many years did you have a good supply?—A good supply of whiting?

55,697. Yes.—For a good few years before last year.

55,698. Is this year the first year that the supply has been very bad?—Yes.

55,699. Is there no other circumstance to account for it?—No, except the small mesh of the net. If they kill the fry, they kill the large fish; we cannot expect them to grow, and it will be the same, in a few years, if these small boats go on the banks. We shall not have any large soles to catch.

55,700. (*Mr. Lefevre.*) How many of the large class of trawlers belong to Liverpool?—Between 50 and 60.

55,701. Does that include the boats at Hoylake?—Yes, we class them among ours.

55,702. How many have you?—Ten.

55,703. Fifteen years ago, how many were there?—Trawlers?

55,704. Yes, of the large class?—We had more then, because we had the Liverpool Fish Company 20 years ago; but they could not make it pay, and they sold their vessels at a great sacrifice.

55,705. There was a trawling company here 20 years ago?—Yes, there were two companies.

55,706-7. How many boats had they?—One company had 19 or 20, and then the other had Hewitt's smacks from London, but they only lasted one season.

55,708-9. Did their vessels fall into the hands of fishermen?—Yes, and fishmongers; but some went away from the country.

55,710. How many were there previous to the establishment of those companies?—We have never had less than 30 or 40 vessels, and there is very little difference now. There have been 40 for the last 25 or 30 years, but there have been occasionally some going and some coming.

55,711. On the whole, for 20 or 30 years the number has not been increasing or diminishing?—No, except a trifle, one or two or so.

55,712. Have you built any vessels within the last five or six years?—Yes.

55,713. How many?—I cannot say exactly how many we have built within the last seven or eight years; three or four, I believe. I think I have built four at Runcorn.

55,714. You did that, notwithstanding the diminution of the fish which has been going on for the last 10 years?—We built them to replace others. Some we sold. I sold two lately to go to Dublin.

55,715. Have the vessels been increasing in size of late years?—Yes, they are finer smacks now.

55,716. Have the nets and the size of the beam increased also?—I do not think the beam has increased much.

55,717. What is the size of the beam you use?—About 46 feet. We formerly had them, about 30 years ago, with a beam of about 42 feet to much smaller smacks.

55,718. Would you think it any impediment to the fishing here, if you were prohibited from using a beam of more than 38 feet long?—I think a beam of 45 or 46 feet is quite short enough for the fine large vessels we are using now.

55,719. What is the tonnage of those vessels?—From 30 to 40 tons, new measurement. Some will carry about 70 tons of cargo.

55,720. How many men do they carry?—Four men and a boy.

55,721. Do they carry more men than they did formerly?—Yes.

55,722. Have the vessels within the last 20 years years doubled in size?—No.

55,723. Have they increased from 20 to 30 tons?—Some vessels have increased to that extent, and some have not. Some of the old vessels were large vessels, because they used pilot vessels for fishing boats.

55,724. Do you think the whole amount of fish brought in by the boats is less than it was 20 years ago, taking the whole of the year round?—I should think it is less.

55,725. But yet you say the price has not much altered?—The price is rather higher, taking it on the average.

55,726. Has that small class of boats you spoke of been shrimping since you can recollect, or has shrimping only been known of late years?—They have always been shrimping since I can recollect; but they had not as fine boats as they have now.

55,727-8. Have they increased in numbers?—Yes, very much.

55,729. Do you think that the shrimping does any harm in destroying the fry of fish?—There is no doubt at all that it does, in certain months of the year, upon the banks.

55,730. I do not talk of the boats that trawl for small soles, but of the shrimping in the months of August, September, and October; do they do a great deal of harm?—Yes; they have got a trap inside the net, and they catch small soles with them.

55,731. Where they have no trap, do they do harm?—No, I think not. When they catch shrimps with a bow net they do not do any harm.

55,732. Do you think that they do not catch small fry at all with them?—No, not of any consequence.

55,733. Have you observed it?—No; but I have seen them bring them in with the bow net.

55,734. Has it been the fashion of late years for the shrimpers to have a pocket or trap in the net?—I cannot say. I do not understand much about them.

55,735. I want to gather whether it is your opinion that the shrimping should be put a stop to in these months?—Not if they have the legal beam to the shrimp net.

55,736. What should be the legal beam?—What they call the bow net. Then they could have it as large as they liked.

55,737-8. But the mesh of that must be small enough to catch shrimps?—Yes; they could have the mesh made as small as they liked, and would catch plenty.

55,739. That net could be used without disadvantage to the trawlers?—Yes.

55,740. Do your own vessels trawl much within an an easy distance from the shore?—They fish off Wales, and half away from here to the Isle of Man.

LIVERPOOL.

R. Isaac.

3 October 1864.

55,741. Do they mostly fish between here and the Isle of Man, or do they go round to Carnarvon and Cardigan Bays ?—They go to both sometimes.

55,742. At what time of the year ?—I have seen them going in the back end in the winter season, in October, November, and about Christmas.

55,743. Do they fish much within three miles of the shore ?—I think not.

55,744. Would it be any injury to your business, if your own trawlers were prohibited from fishing within the bays ?—Yes, I think it would.

55,745. Would it cut off a good deal of their fishing ground ?—It would cut off a great supply of ray for the poor people. They catch a deal of that in the bays sometimes, and soles too. If they are out fishing for ray they get nothing else, and the poor people get all of it.

55,746. What bays are you speaking of ?—In Carnarvon and Cardigan Bays they catch a good deal of ray.

55,747. Do they fish within any of the bays off Great Ormes Head and on the Welsh coast ?—Yes, sometimes.

55,748. Do you think it would diminish the supply of fish, if your own boats were prohibited from fishing in the bays ?—Yes ; sometimes we would not get half the supply for the market. There are certain times of the year when they fish there ; they fish closer in for about two or three months.

55,749. Do your boats not fish over the same ground as the trawlers from Fleetwood ?—Very often ; they are all connected together.

55,750. Are you aware that they do not complain of the falling off of fish ?—They have been complaining of the falling off of fish, because a great many of their smacks went coasting last summer.

55,751. We heard no complaints from them. Is there a falling off in the soles alone, or is it in all fish ?—In all fish ; but it is more so in regard to soles and flukes. We used to get a beautiful fishing of flukes in the spring time ; but the Southport and Fleetwood boats, by fishing on the banks, have destroyed all the spawn of the flukes, as well as of the soles.

The witness withdrew.

R. Evans.

Robert Evans called and examined.

55,752. (*Mr. Caird.*) You are the master of a trawl-vessel ?—Yes.

55,753. Have you had many years' experience as a trawler off Liverpool ?—About 20 years.

55,754. What grounds do you chiefly frequent ?—Betwixt the light ship and the Isle of Man, Carnarvon, Redwharf Bay, and Cardigan Bay.

55,755. Over what part of the ground do you find that you have the most successful fishing ?—The best we have had this year was on a ground we only found out last year.

55,756. Where was it ?—In Cardigan Bay. The first time we started it was last May.

55,757. Had Cardigan Bay not been fished before ?—Not by our boats.

55,758. Not by trawl-boats ?—Not that we know of. The men belonging to Carnarvon told our boats of the ground. In winter weather we tried it, and we found plenty of fish.

55,759. When you are fishing in that bay, do you land your fish at Aberystwith ?—No, we bring them to Carnarvon.

55,760. Is this the first year you have been to Cardigan Bay ?—Yes.

55,761. Did many trawl-vessels go there for the first time also ?—No. Three of our vessels first started, and now there have been 12 or 13 boats there. They are all that have been there as yet.

55,762. Did it yield more fish than any other ground you have been in the habit of fishing upon ?—Yes ; when we first started there we made more than those who were fishing on this side.

55,763. You have continued during the season to fish on that ground ?—We were only there three weeks after first starting, when we came back, and went to the northward again.

55,764. Did the ground begin to give way ?—The soles were not as thick, and the summer was getting warmer.

55,765. Then you found it better to go to deeper water ?—Yes, between here and the Isle of Man.

55,766. On the ground you have continued to fish for many years ?—Yes.

55,767. Do you still find an abundance of fish on the ground you fish ?—Yes, just at that time, for about three months ; then they drop off.

55,768. Was there any particular fish more than another that became scarcer ?—All of it went scarce.

56,769. Did they shift their ground ?—They shifted off somewhere else.

55,770. Did you know where they had gone to ?—No.

55,771. You have not been able to find them ?—No.

55,772. When was that ?—In June.

55,773-4. Is it usual in June to find the fish become scarcer and shift their ground ?—They always go away from that ground after June.

55,775. It is a thing which has not happened exceptionally, but has been the case for many years ?—Yes, but they have not been near as thick for the last three or four years as they have been in other years.

55,776. On the ground between this and the Isle of Man ?—Yes.

55,777. Have any fish more particularly than another fallen off ?—Yes, skate, and soles, and plaice, and flukes, and haddocks and all those sorts of fish.

55,778. Haddocks, we understand, have entirely disappeared ?—Yes, they have gone altogether.

55,779. For a good while ?—Yes, and whiting.

55,780. The previous witness told us that you are now catching less whiting from having a smaller mesh in your nets.—The small mesh has caught them.

55,781. Are the fish very small ?—Some are big and some are very small.

55,782. Are they of a smaller class than you used to catch ?—Yes, they are a deal smaller. We could not catch the whiting we have caught with the mesh we used to have ; they would all have gone through.

55,783. What quantity of fish can you catch in one haul with your trawl net, taking it on the average of a good season ?—In one haul ?

55,784. Yes ?—It is very hard to tell.

55,785. Are you out for a week together, generally ?—We are out for three weeks sometimes.

55,786. Are you out for three weeks in the month of May ?—Yes.

55,787. And do you send home the fish daily by one of your fleet ?—Yes, every day. One boat takes it in turn, one boat one day and another another.

55,788. How much may you get in one boat for three weeks' fishing ?—Sometimes we may get 6*l.* a man, sometimes 7*l.* a man, sometimes 5*l.* a man. It is just according to what sort of luck we have when we are fishing.

55,789. 5*l.*, 6*l.*, or 7*l.* a man,—that will be the proportion which will fall to each man for three weeks' fishing ?—Yes.

55,790. Has it diminished much in recent years as compared with what it used to be ?—The fishing has gone a good deal worse ; for the last two or three years it has gone a great deal worse.

55,791. Is it only within the last two or three years that this great falling off has taken place ?—It began about three years ago, and it has been going worse every year.

55,792. What do you think is the cause of that ?—

We used to say it was the small boats with the small mesh and the small whiting mesh.

55,793. When did you introduce your small whiting mesh ?—We began with it about seven or eight years ago.

55,794. And it did not begin to show any injurious effect until two or three years ago ?—No.

55,795. Do you know how long the small boats have been fishing in the shallow water with the small mesh ?—About 20 years back.

55,796. As long as you can recollect ?—Yes.

55,797. Has this diminution only begun to show itself within the last two or three years?—They have not caught as much lately as they used to do.

55,798. Are the boats increasing rapidly ?—Every year.

55,799. Then they must find it a better business ?—Yes, it has been a good business for them this year. Some boats have had in a day 140 lbs. of small soles, about the length of my finger.

55,800. (*Mr. Lefevre.*) What would they sell for in the market ?—They would give 4*d.* a pound for them, and 8*d.* for the big ones.

55,801. Do you catch soles of that size ?—Not quite as small as they catch. We cannot do it. Our mesh is a deal bigger than theirs.

55,802. (*Mr. Caird.*) Within your recollection, has the number of boats with the deep-sea trawl very much increased ?—Yes, there are a great many more. There is a fleet now at Fleetwood, and I can recollect when there was only one there.

55,803. How many are there there now ?—There are now 30 or 40 there.

55,804. Are there more out of Liverpool and the neighbourhood than there used to be ?—I do not think that there are. I think not. I do not think there are more, or more out of Hoylake. There are 17 or 18 boats out of Hoylake.

55,805. I suppose you use a smaller mesh in the deep-sea trawl than you used to do ?—Yes, at the whiting time of the year. From now until the latter end of March.

55,806. What proportion of the whole catch of your fish is of that small size, the taking of which you think is injurious to the fishing ?—I do not know.

55,807. Suppose you had a haul in your net of 10 baskets of fish, how many baskets would be small fish, which you think ought not to be taken in that way ?—Five or six baskets out of the whole.

55,808. One half of the whole quantity ?—Yes.

55,809. And five years ago would you have taken almost none of that description of fish ?—We would have taken none of the small fish. They would have all gone through the mesh.

55,810. Do you bring everything you take on board to the market for sale ?—Yes, all that comes to the net.

55,811. Are there none so small that you throw them back again into the sea ?—Very few.

55,812. Do you find a market for all you can get and bring ashore ?—Yes, very near; we do not throw many away.

55,813. Do you ever come in contact with the line fishermen ?—No; I have been a good many years with the Isle of Man boats when they have been codfishing.

55,814. They do not complain that you interfere with them ?—No, I never heard them say anything.

55,815. (*Mr. Lefevre.*) Was there formerly any line-fishing from Liverpool ?—No; there is a little from Hoylake for a couple of months, but it is all going off now.

55,816. Twenty years ago, was there any line-fishing from Liverpool ?—There used to be more then than now. They got a good many codfish at Hoylake with lines, but now they are doing nothing at all with lines.

55,817. But, 20 years ago, from the port of Liverpool, was there any line-fishing ?—I do not recollect that there was.

55,818. Have you yourself seen these small trawlers at work ?—Yes.

55,819. Have you seen them haul up their trawls ?—Yes, and I have been with some of them.

55,820. Do they take any quantity of small fish, so small that they are unfit for the market ?—I have seen them come ashore in a day, and bring three or four hundredweight of small fish, so small that you might blow them away. They throw them on the beach when they are cleaning the stuff out.

55,821. Were they mostly small soles ?—Small soles, small flukes, and all sorts of fish.

55,822. What other sorts ?—They have said that they have had as much as would come to 20 baskets of soles if they had been big.

55,823. What other kinds ?—Small ray, just so large that you could see them.

55,824. What else ?—I do not know.

55,825. Did you ever see small herrings ?—No.

55,826. They are mostly flat-fish ?—Yes, they are the only fish that came ashore.

55,827. Do they throw any overboard ?—They throw it all overboard.

55,828. You mean the small ?—Yes.

55,829. Is it alive when it is thrown overboard ?—No, it is all dead. They have no time to clean the nets. They are "agate," working the boat all the time, and they leave them until they come ashore.

55,830. They wait until they come ashore before they throw the small fish overboard ?—Yes, they wait until they have finished the day's work, and they clean the fish as they come back. The small is then thrown away, and it is all dead.

55,831. Those boats are engaged in shrimping at other times of the year ?—Yes; part of their time they are shrimping, and in the other part trawling. But there are some shrimping all the year round. There are only half of them trawling now at Hoylake.

55,832. But of those 20 boats that go from Hoylake and Liverpool, one half of them are engaged in shrimping all the year round ?—Yes.

55,833. And one half give up shrimping for three months, to take to the small trawls ?—Yes.

55,834. Can you recollect when the small trawl was not used by the small boats ?—It is a good many years ago.

55,835. How many years ?—Thirty years, I suppose.

55,836. How many took to trawling then ?—There are about 10 at Hoylake now, out of 30.

55,837. What were there then ?—Not more than two or three.

55,838. Did they greatly increase in number ?—Yes, they increased. Some would have trawls now, but they could not exactly afford it for the time of year.

55,839. What is the length of the beam of those trawls ?—About 30 feet.

55,840. What is the size of the mesh ?—It is very small, about one-inch mesh, I suppose.

55,841. Is there a pocket in the net ?—Yes, the same as in the big boats.

55,842. What is the length of the net ?—It is 14 or 15 yards long from the top of the beam down to the bottom of the cod end.

55,843. Taking the boats shrimping during August, September, and October, do they take any number of small fish too ?—They are taking them all the year round.

55,844. But, during those three months, do they catch a large number of small soles ?—Yes.

55,845. Do many of them have pockets to their shrimp nets ?—No; what they have is a trap. They lace it along the back, and if a big skate or sole comes in, it drops down into the belly, and cannot get back again.

55,846. Is it sufficient to prevent small fry from getting out again ?—The small fry have nothing to do with it.

55,847. If small fry got into it, could they get out

LIVERPOOL.

R. Evans.

3 October 1864.

again ?—No, they could not get out again, if they once got into the net.

55,848. Then those 30 shrimpers that continue shrimping in August, September, and October, catch a considerable number of small fish ?—Yes ; it is they who do the damage.

55,849. What number of shrimpers were there 20 years ago ?—I cannot recollect.

55,850. Was there a great number then ?—Not in Liverpool, but I can hardly tell what there were in Hoylake.

55,851. Have they doubled within the last 20 years ?—There are more, certainly, but I do not know how many more exactly.

55,852. Which do you think do most harm in taking small fish, the shrimpers or the trawlers ?—The shrimpers.

55,853. On what ground,—have they a smaller mesh to their net ?—They are like to have a very small mesh to catch shrimps.

55,854. But, in catching the small fry of fish, the shrimpers do more harm than the small trawlers ?—Yes.

55,855. Is that because they have a smaller mesh ?—Yes, and they are on the bank all the time.

55,856. They fish in shallow water ?—Yes, all the time.

55,857–8. And they are more on the ground where the small fish are found ?—Yes.

55,859. Twenty years ago, were there 40 shrimpers and small trawlers fishing from Liverpool and Hoylake ?—Yes.

55,860. Were there more than that ?—Yes.

55,861. Then this mode of fishing has been going on for a great number of years, year after year ?—Yes.

55,862. But you did not discover any falling off in your fish until two or three years ago ?—No, we did not.

55,863. Do you think there is any mode of preventing the shrimpers from catching the small fry of fish ?—I do not know, I am sure.

57,864. Have you ever considered that there is any mode of preventing them, short of stopping them altogether ?—I do not see how it is to be done, for the shrimps are like to be caught.

55,865. Would the public do without their shrimps ?—That is what I am looking at.

55,866. Is it possible to put a stop to shrimping altogether,—have you considered whether that is possible ?—No, I do not think it is.

55,867. Then you do not think it would be possible to stop the catching of these small fish if the shrimping is allowed ?—All I say is, that if they use their bow nets they would catch a great deal less, but they would catch some for all that.

55,868. Are there a great number of fishermen who fish with the bow net now ?—No, there is not one in Hoylake who fishes with a bow net now.

55,869. Will you point out to me the difference in the nets ?—With a bow net they have a piece of wood, and they drag the net along the bottom. It does not go as much on the ground as the trawls. The shrimpers at Hoylake have proper trawls, the same as the big boats.

55,870. What is the length of the beam of the trawl used for shrimping ?—Twenty-one and twenty-two feet.

55,871. When did they give up the bow net ?—For the last 20 years at Hoylake.

55,872. Did they give it up because they found they could catch more fish with the trawl ?—They can catch twice as much with the trawl.

55,873. Then if they work them as bow nets, they would not catch one half the quantity they do now ?—No, not one half.

55,874. (*Mr. Caird.*) Do you allude to shrimps, or to all the kinds of fish they catch ?—There is nothing but shrimps and fry that they can catch.

55,875. If they used the bow net alone, could they make as good a fishing of shrimps as by using the other net alone ?—No.

55,876. They could get more shrimps by the trawl net ?—Yes.

55,877. (*Mr. Lefevre.*) If a stop were to be put to the small class of trawlers during August, September, and October, would they take to shrimping during those months ?—Some shrimp all the time.

55,878. But if trawling were prohibited, would they be engaged in shrimping during those months ?—Yes, they would be like to go shrimping because there would be nothing else for them.

55,879. Then would it not follow that they would catch more small fry by shrimping than trawling ?—They would not catch the soles they are catching now. They will all go into deep water in another month or two, and then they cannot catch them.

55,880. But you told us that the shrimpers catch more small fry ?—Yes, but it is a smaller sort, even smaller than they catch now.

55,881. Do not the shrimpers catch small soles ?—Yes.

55,882. Then if trawling were given up during those three months by the small class of trawlers they would take to shrimping, and catch as many as they do now ?—There are many shrimping all the time. They would not catch those coming in now.

55,883. They would not catch the larger class of soles, but they would catch the small ones ?—Yes.

55,884. They would catch more unfit for the market, and not as many that would be fit for the market ?—Yes.

55,885. (*Mr. Caird.*) If that was the effect of a close time, it would be rather injurious to the fishing than beneficial ?—All that would be necessary to be done would be that they should have the same size of mesh when trawling as the big boats.

55,886. You think the regulation of the mesh is the best thing ?—Yes.

55,887–90. (*Mr. Lefevre.*) Would it be any injury to the trawlers here, if they were not allowed to use a mesh smaller than $3\frac{1}{2}$ inches when pulled out ?—That would be a great size ; $2\frac{1}{2}$ inches are plenty.

55,891. Two and a half are enough ?—Yes.

55,892. Did you ever hear of a law prohibiting the trawlers from using a mesh of less than $3\frac{1}{2}$ inches when pulled out ?—No.

55,893. You never heard of it ?—No.

55,894. Do you think it would be an injury if such a law was carried out, then ?—They could catch nothing at all, if they had a mesh that size.

55,895. Would it cut away half of your fishing ?—It would cut it away altogether.

55,896. With regard to the length of the beam, you say it is 46 feet long ?—Yes.

55,897. Would it be injurious to be prohibited from using one longer than 38 feet ?—The big boats would have to lay up, they could not work them at all.

55,898. What is the weight of your trawl heads ?—Six score pounds each head.

55,899. What do you weight your foot rope with ?—It will be about a hundredweight and a half when the worm is on it. We put ropes to it.

55,900. Would it be any injury to prohibit you from weighting your ground-rope with more than 110 pounds ?—It would make no difference at all.

55,901. Is there any reason why there should be a limit as to the weight put upon your ground-rope ?—No.

55,902. Do you sometimes put a greater weight than at other times, according to the class of fish you wish to catch ?—Yes, according to where we are. Sometimes we do not put half the weight upon it.

55,903. Do you often come across the herring fishermen from the Isle of Man ?—No, we never come across them.

55,904. Do you not fish off the Isle of Man when the herring-fishing is taking place there ?—No, we catch herrings from here and from Howth in this season.

55,905. But do you trawl there when the herring

fishermen are at work there?—No, we do not go as far.

55,906. Do you fall in with any fleets of herring-boats in Cardigan or Carnarvon Bay?—No.

55,907. Do you trawl in the channel off Dublin?—No.

55,908. Have the fishermen here most of them an interest in the trawl-boats?—Some of them have; some of the captains have.

55,909. Are you paid by shares?—Yes.

55,910. Do the smaller class of trawlers and shrimpers mainly belong to the fishermen?—Yes, they all belong to the fishermen themselves.

55,911. (*Mr. Caird.*) Have you ever noticed on the banks here whether there are any pools of water left when the tide goes out?—Yes.

55,912. Have you observed any small fry in those pools?—No, we never take any notice of that.

55,913. We were told that in some of the bays further north a great destruction of small fry often occurs in consequence of the water being evaporated in warm weather; have you observed anything of the sort here?—No.

55,914. A destruction of that kind does not occur here?—No. It may, but I never knew it myself.

55,915. (*Mr. Lefevre.*) Do you fish much within three miles of the coast, along Cardigan Bay and Carnarvon Bay?—In Cardigan Bay we fish 20 miles off the land.

55,916. Not nearer than that?—No.

55,917. On the Welsh coast generally do you fish within three miles of the land?—Within three and four miles along Redwharf from Ormes Head down to Lynas.

55,918. In what depth?—From eight, nine, and ten fathoms down to 12 and 14 fathoms.

55,919. Do you catch many small fish there?—No, we only go there when the fish are large.

55,920. Is there any time of the year when you catch more small fish than another?—Yes.

55,921. What time of the year is that?—Right in the middle of the summer, the latter end of June and July.

55,922. Where are you fishing then?—All in the bays. There would be no use in going too far off.

55,923. What would be the effect of prohibiting you from fishing within the headlands in the bays? Suppose you were prohibited from fishing within the headlands in the bays, would it be an injury to your fishing?—For what time?

55,924. All the year round.—Yes, it would be a great injury, just when the fish set in. Both soles and flukes, and skate, and everything set in at a certain time of the year, and they are pretty large too.

55,925. What time of the year do they come into the bays?—They are in the bays now.

55,926. In the summer time?—In the latter end of June and July we catch small fish, and then they go larger afterwards.

55,927. Then you fish again in the bays at this time of the year?—Yes.

55,928. Would it cut off one half of your fishing, if you were prohibited from fishing within the headlands in the bays all the year round?—Yes, it would.

55,929. Would it be possible to carry on trawling with benefit from here, if fishing within the bays were prohibited?—We get a good deal now, and the fish are all getting large.

55,930. What would be the effect upon the trawling trade in Liverpool, if fishing within the bays were prohibited?—It would stop us from getting a good deal of fish, that is all I know.

55,931. (*Mr. Caird.*) Then are we to understand from you, that the only remedy you see for the destruction of small fish would be by making a regulation that a certain mesh should be used less than which should not be permitted?—Yes.

55,932. And it should apply to all descriptions of boats, both large and small, fishing in shallow and in deep water?—Yes, they must keep the same rule. Every one must follow the same rule. If you were to allow one to have a small mesh and another a big one, one boat would come in with a catch of whiting and another without any at all; one might have 10*l.* worth of whiting and another not four shillings worth.

55,933. Your remedy is a prescribed mesh, a size of mesh smaller than which shall not be used?—Yes.

55,934. I think you also stated that there should be some regulation as to the shrimp net, viz., that it should not have a bag in it for catching small fish?—The bag does not do any harm at all.

55,935. Then what is the objection you have to the shrimp net?—They ought to have bow nets, instead of trawls.

55,936. The shrimpers should not be permitted to fish with a trawl net?—No.

55,937. The effect of that would be that they would not catch as many shrimps?—Yes; and not as many small fry.

55,938. (*Mr. Lefevre.*) Is there any time of year when the shrimpers catch more small fry than another?—There is a time of year when they would catch more than another.

55,939, But do they catch them in considerable quantities all the year round?—They catch them all the year round, but in the summer they catch a deal more.

55,940. Would it be any advantage to stop shrimping during the months of December, January and February?—No.

55,941. It would be of no advantage?—No, I think not.

The witness withdrew.

THOMAS WHITAWAY called and examined.

55,942. (*Mr. Caird.*) Are you a trawl fisherman?—Yes.

55,943. Are you at present engaged in that business?—No, I have boats of my own, but I do not go to sea.

55,944. You are a trawl-boat owner?—Yes.

55,945. Have you been a trawl fisher?—Yes.

55,946. You have had considerable experience in connexion with trawl-fishing on the coast of Liverpool?—Yes.

55,947. For many years back?—For the last 40 years.

55,948. Can you tell us if the supply of fish which the trawl-vessels get is increasing or diminishing here?—The best supply we get is between Isle of Man and Liverpool, about halfway between.

55,949. Is the supply as good as it used to be?—I cannot say that it is by a great deal.

55,950. Has the number of boats fishing on these grounds increased?—There has not been any increase in the number of boats, but there have been a good many that have gone away, and others have come in their place.

55,951. The boats that have recently been built are larger and finer, and the nets are better?—The nets are longer and the boats are larger.

55,952. Are the meshes smaller?—Yes.

55,953. What has been the result of that,—have they got a larger supply of fish than they used to get?—No, the result has been that one has been getting a smaller mesh, so as to get more fish than another.

55,954. Have they succeeded in doing that?—Yes, a good many of them.

55,955. Do the boats with the smaller mesh get a larger quantity of fish?—Yes.

55,956. Are they marketable fish?—Yes, they bring them into the market, and they are sold.

55,957. Some have not succeeded in getting so

LIVERPOOL

T. Whitaway.

3 October 1864.

many fish as they used to get?—No, they do not succeed in getting as many fish as they used to do, by nearly one half.

55,958. What is the cause of that?—I think it is the small mesh.

55,959. The small mesh they themselves use?—Yes.

55,960. Which has generally reduced the fish on the fishing bank?—Yes, I think so.

55,961. Is there a large extent of ground between Liverpool and the Isle of Man which is suitable for trawling over?—The ground is not very extensive. It is in a small compass from this to the Isle of Man and round about, unless the boats go to Wales and Carnarvon Bay. The fishing round Liverpool is not large.

55,962. (*Mr. Lefevre.*) Is there a great deal of ground between this and the Isle of Man that is rough and unfit for fishing?—There is a good deal of ground between this and the Isle of Man upon which they cannot fish. They have only a certain district, a certain length and breadth upon which they can fish.

55,963. What is the length and breadth?—I cannot say exactly.

55,964. Can you give us anything like an idea?—No.

55,965. (*Mr. Caird.*) Can the boats always take fish upon that ground?—At this time of the year the boats shift to look after the fish; when they cannot get it at other places then they draw nearer home.

55,966. During all your experience, the fish have been in the habit of leaving certain grounds, and frequenting other grounds, as the time of year progresses?—Yes.

55,967. The fishermen know pretty well how to follow them?—They follow them according to their own opinion. They go inside or outside, and they search about for them as they think they can find them.

55,968. Then you attribute the falling off in the fish chiefly to the use of the small mesh in the net?—Yes.

55,969. Do you refer to your own vessels as well as to the small vessels which are fishing in shallow water?—I propose that we should have a bigger mesh than we have at present. I think that has been the cause of a great deal of the falling off. We have been killing a great deal of the fry, and I think we ought to have the old regular mesh which we used to have.

55,970. You think that some regulation should be enforced as to the size of the mesh?—Yes, I think that would be better for the fishermen themselves.

55,971. If that were done, you think it would lead to a larger supply of fish?—It would, I think, in the course of time. It might not be in my time, but it would in the course of time. It would not kill the small fry, but it would give them a chance of getting through the net alive.

55,972. Do you catch more whiting with the deep-sea trawls than you did?—They do not catch many now, but they have caught large quantities by using a small mesh.

55,973. Are there any whiting caught by the small boats in shallow waters with the small mesh?—I cannot say what they catch in shallow waters, because I am not much acquainted with them.

55,974. You do not know whether there is any supply of whiting coming from those small boats?—No, I do not, but I think not.

55,975. Then the decrease of whiting must be solely attributable to the use of the small mesh in the large boats?—Yes.

55,976. Have you had any experience of shrimping?—No.

55,977. Nor of line-fishing?—No; all my experience has been in connexion with trawl-fishing.

55,978. Do you not find that the trawl-fishing is as profitable a business as it was some 10 years ago? It is not as profitable as it was, the fish are not caught now.

55,979. Is it not the fact that some new large vessels have been built within the last few years?—They have been building them larger, but that was to enable them to go out all the winter through, when gales of wind are blowing. They have got them larger on that account.

55,980. Your experience then only applies to the deep-sea trawling?—That is all.

55,981. You have only fished with advantage lately in Cardigan Bay?—I never was fishing there.

55,982. Or in Carnarvon Bay?—Yes, I was there, and in Redwharf Bay, but I was never down in Cardigan Bay.

55,983. Is it a good ground for trawling along the Welsh coast?—Yes, it is very good ground, as far as I know it.

55,984. Is there a good ground for trawling between Bangor and the Dee?—Yes.

55,985. Is it regularly trawled over?—Yes, in the season of the year they go there.

55,986. The deep-sea trawl-vessels go there?—Sometimes.

55,987. Is it trawled by the small boats?—Some of the big ones go there trawling, as well as the small ones, at times.

55,988. Is there any particular kind of fish you notice that has fallen off more than another as caught by the deep-sea trawlers?—I do not know particularly. It has all gone away partly, more or less.

55,989. Has there been a large increase in the number of vessels employed in trawling in the deep sea altogether, in your experience?—There are not very many now, but there may be 20 vessels more than there used to be in former times.

55,990. Are we to understand that with the increase of vessels compared with what it was 10 or 12 years ago, there is a smaller total supply of fish caught than there used to be?—Yes, there is not such a supply of fish caught as there used to be, not by one half.

55,991. Has the price of fish increased very much here?—It is according to the catch; according to the quality.

55,992. Has there been a corresponding increase of price equal to the falling off in the quantity of fish?—No; it all depends upon the scarceness of the market when the fish come in what price we get; it may be affected a great deal by bad weather.

55,993. (*Mr. Lefevre.*) How many trawlers have you got yourself?—Three.

55,994. When did you give up going out yourself in them?—About five years ago.

55,995. Since you gave up going out yourself, have they not done as well?—They have not done as well as they did when I was young, and there has not been as much fish caught.

55,996. When did you begin to observe the falling off of the fish?—For the last two or three years.

55,997. Then you agree that up to two or three years ago there was not so great a falling off in the fish?—There had been a falling off, a little at a time, for several years before that, but not to be as it is now.

55,998. The greatest falling off you have noticed within the last two or three years?—Yes.

55,999. When did the trawl-boats take to using a smaller mesh?—I cannot say, but I suppose about four or five years ago.

56,000. Have any of them two nets, one with a small mesh, and another with a large one?—I do not know whether any of them have two trawls, one a small one and one a big one, but I have heard it said that they have.

56,001. Has the weather during the last year or two been any impediment to the fishing?—The weather is a good deal against us sometimes.

56,002. During the last year or two, has the weather been against you?—It has not been so bad here.

56,003. It has not been bad for trawling?—No.

56,004. What is the extent of the trawling ground

you can trawl over ?—About 50 or 60 miles, taking the length and breadth.

56,005. Do all the boats from Liverpool, Fleetwood, Hoylake, and other parts fish on that ground ?—Yes, they are all there at times.

56,006. Do the Dublin boats go over the same ground ?—No, they never go there.

56,007. There must be a fleet of nearly 100 boats fishing on that ground ?—I daresay, with the Liverpool and Fleetwood boats altogether there are 100.

56,008. Is it not possible that the number of trawl-boats have increased too much for the amount of ground they fish over ?—I cannot say, but if they had the larger mesh it would give liberty to the fish to go through.

56,009. If they used the larger mesh it would be better for themselves ?—I think so.

56,010. Have you tried it yourself in your boats ?—No. The piece of net which has been shown to you is what my boats have. I made them bring it on shore on Saturday, and I took the size of it.

56,011. Is your own somewhat larger ?—My own boats are large boats of 41 or 42 tons.

56,012. What is the size of your mesh ?—About two and a half or three inches.

56,013. You say it would be an advantage if you used a larger mesh. Have you not tried it yourself ?—I have not tried it, because I have not been out to sea with the boats for the last five years. The men who are in it try it themselves.

56,014. You leave it to the master of the vessel ?—Yes, to the master of the boat.

56,015. You do not exercise any authority yourself over the mesh ?—No.

56,016. You leave it entirely to the master?—Yes; he finds his own size of mesh, according to what his opinion may be. He uses what size he thinks will do best.

56,017. When you were yourself fishing, you did use a larger mesh ?—Yes.

56,018. Have you ever observed the small fish brought in by the smaller class of trawlers ?—No, I have not been much in the market to see anything of the sort.

The witness withdrew.

JAMES CLARK called and examined.

J. Clark.

56,019. (*Mr. Caird.*) You have heard the evidence given to us in regard to trawling in the deep sea ?—Yes.

56,020. Have you anything to add to it ?—Nothing further than that no boat that fishes with a trawl beam, either small or large, should have less than a three-inch mesh.

56,021. A mesh of less then three inches ought not to be permitted in beam trawling ?—No, and then let their boat be ever so big, they should not be allowed to have above a 40-feet beam.

56,022. Does not the length of the beam depend entirely on the size of the vessel ?—No, they can work a beam of any length in the vessel.

56,023. Have you been practising trawling ?—Yes.

56,024. How long have you been trawling ?—Thirty years and more.

56,025. If you had a large powerful vessel, would it not run away with a small beam trawl ?—Not at all. I never used to have a beam of more than 38 feet long.

56,026. What was the size and tonnage of the vessel ?—The same size as I have at present, namely, 50 feet on the keel.

56,027. What is your beam now ?—Forty feet long.

56,028. What size was it formerly ?—Thirty-eight feet.

56,029. The vessel is of the same size ?—Yes.

56,030. What is the weight of your head-irons ?—They are heavy.

56,031. Are they heavier in proportion ?—Yes, in the same proportion as the largest size of vessel.

56,032. Would it not be the case, if you used a lighter beam and head-irons, that a more powerful vessel would not be able to fish in the same way ?—You can have a beam of the same weight, and the length of the beam, and the weight of the head-irons, and everything in the same proportion.

56,033. What would the effect of that be ?—Instead of sweeping the length we at present sweep, we should only sweep three parts of it.

56,034. Then you would only have a chance of catching three parts of the fish ?—We made a good living before by it. Some of the boats have now got a beam 48 feet long, and some of them have got them quite as large as the vessel. I think they ought to have a beam of the proper length. Let the boat be big or small, a beam 40 feet long is quite long enough.

56,035. If she can have a beam 48 feet long, why should she not have it ?—I think the big boats, which have a beam 48 feet long, would be just as well with a 40-feet beam.

56,036. What is the amount of tonnage and the length of vessel that could carry a 48-feet beam ?—The length of the vessel is 54 feet.

56,037–38. You say you should change and carry only a 40-feet beam ?—Yes.

56,039. What size of vessel smaller than that could also carry a 40-feet beam ?—There is scarcely a boat out of Liverpool that could not carry one.

56,040. Then you would reduce the power of the larger vessels to that of the smaller ones ?—Yes.

56,041. What advantage would there be to the public in that ?—The vessels would catch less fish.

56,042. But we want them to catch more fish, if possible.—They must have a bigger mesh to catch more fish.

56,043. Is it not rather your objection, that a small mesh should be used ?—Yes, and that the beam of the vessel should not be more than a certain length.

56,044. Have you anything else to say to us ?—No, excepting with regard to the shrimpers. The bow nets and the trawl nets they use are killing a great deal of small fish. These shrimpers made a living before they had trawl nets to catch the shrimps, but now they have trawl nets 25 feet long on the beam, and they are killing a power of small fish.

56,045. Have you seen them at work ?—Yes, many a time.

56,046. Have you seen what they have caught ?—Yes.

56,047. Have you seen small fish in the trawls ?—Yes.

56,048. Are you speaking of the shrimpers in the river ?—Yes, the shrimpers belonging to the Liverpool river.

56,049. Where do they fish ?—In the Channel between the light ship and Formby Channel.

56,050. Do they fish with bow nets ?—Yes.

56,051. When did they introduce the trawl net for shrimping ?—18 or 19 years ago.

56,052. Have they been fishing for 18 or 19 years with the trawl net for shrimps ?—I daresay they have.

56,053. When did the damage first make its appearance ?—For a few years past.

56,054. (*Mr. Lefevre.*) Do you agree with the previous witnesses, that a great diminution of the fish here has taken place during the last two or three years ?—Yes, for the last few years a diminution has taken place. It has been since they begun to have the nets with the small mesh. The last time I was out in the deep water we had such a haul of fish that it was as much as we could do to get them on board with the tackle we had; and out of that we had only a basket and a half of good fish. There were 10 or 15 baskets which I shovelled overboard again; I was glad to get rid of it.

LIVERPOOL.

J. Clark.

3 October 1864.

56,055. Were they alive?—Some were alive, but the greater part were dead.

56,056. How long had your trawl been down?—Something like four or five hours.

56,057. (*Mr. Caird.*) What is the size of your mesh?—Our mesh, I daresay, is two inches.

56,058. (*Mr. Lefevre.*) When drawn out?—Yes.

56,059. Then it is one of the smallest class of nets?—No, there are smaller than that. There are boats with nets that you could not push your finger through. Those are the boats which carry a beam of 48 or 49 feet.

56,060. When did you take to the small mesh you speak of?—I never have had a small mesh yet.

56,061. You say that your mesh is only two inches?—Yes, but that is a great deal larger than they have.

56,062. When did you take to that mesh?—I have had that mesh since I have had charge of the vessel.

56,063. Is the vessel your own?—Yes.

56,064. (*Mr. Caird.*) With a two-inch mesh, you told us that something like nine-tenths of your whole catch the other day was small fish?—Yes, they were small garvies, small flukes, and such like fish, which could not escape out of the net.

56,065. With that mesh you did considerable damage to the brood of fish?—Yes.

56,066. You destroyed a large quantity not fit for the market?—Yes.

56,067. Then a two-inch mesh, for that reason, would seem to be too small?—Yes; a three-inch mesh would be little enough for any net.

56,068. (*Mr. Lefevre.*) Would not three and a half inches be the proper size?—No, that would be too large.

56,069. Why?—The hole would not hold the fish about the fins; they would go through.

56,070. What would be the effect of it?—We should catch a great deal less soles.

56,071. When did you alter the beam of your trawl from 38 to 47 feet?—I have always, since I had a vessel, had my beam 40 feet long.

56,072. When did you alter it from 40 to 47 feet?—Last Christmas.

56,073. What made you do so?—Other boats had them, and the men who sailed with me said, "Why "not have a beam of the same length as other "people?" There was considerable grumbling because I did not have a small mesh to catch the whitings; but I thought that, if I did not have whitings, the catch of other fish, on the whole, would be quite as well for me. I have known other boats come up with 40 or 50 baskets of whiting, when I have not had one.

56,074. What size were those whiting?—Some of them were only the length of your finger.

56,075. Were they brought to market?—Of course they came to the market, and in a scarce time they will get something like 4*s.* or 5*s.* a basket for them, whereas, if they were proper fish, they would bring in 10*s.* or 11*s.*

56,076. If the fish were allowed to remain in the water for one year, and you then caught them, they would bring 10*s.* or 11*s.*?—Yes, but they would get bigger fish in less than a year.

56,077. In six months?—Yes.

56,078. Were those whiting damaged at all by being brought up in the trawl?—Damaged?

56,079. Yes; rubbed about, and the scales broken off?—Not much; there may have been a few here and there that were crushed.

56,080. How many baskets have you seen brought up together?—I have seen boatloads come to the market, when I have come in with only six or seven baskets.

56,081-2. How many baskets would they have?—Thirty or forty baskets.

56,083. When they were brought up in such quantities were they damaged from being knocked about and bruised in the trawl net?—Not much. There may have been a few injured, from getting in 12 baskets in a haul. They cannot open the net without having some of them crushed, and many a time we are obliged to tread among them with our feet.

56,084. But, on the whole, there is not much damage done?—There may be several crushed; you may get a basketful out of 20. Some of them are shovelled overboard, but they shovel very few overboard if they can help it.

56,085. Do you ever take up spawn in your trawl net?—Yes, often.

56,086. Where have you done that?—Inshore, between Morecambe, Liverpool, and the light ship.

56,087. What kind of spawn is it?—It is impossible to tell.

56,088. Do you know the difference between herring spawn and squid spawn, and between squid spawn and sole spawn?—No, I don't know the difference between sole spawn and fluke spawn.

56,089. Do you know what sole spawn is?—No; it is like any other spawn.

56,090. But you know that it is spawn?—I consider that all spawn mixes together, flukes, soles, garvies, gurnards, and all sorts of spawn mix together.

56,091. Do you think it is desirable that your boats should be prohibited from trawling in the bays when they are likely to take up this spawn?—I do not think it is a benefit to fish inshore when we we could only catch small fish.

56,092. Then why have you done so?—I have done so because others have done so, in order to make a livelihood. If one or two boats come up with a catch of fish, and I am out in deep water, and cannot get a catch, then I cannot get men to come into the vessel and work for me.

56,093. It does not depend upon your own opinion alone, but upon that of your men also?—Yes.

The witness withdrew.

W. Langharne.

William Langharne called and examined.

56,094. (*Mr. Caird.*) What is your present occupation?—I am master of a fishing smack.

56,095. Of a deep-sea trawler?—Yes.

56,096. Have you anything to add to the evidence we have already heard, in regard to deep-sea trawling?—I have nothing to add in reference to the deep-sea trawling, more than this, that the small mesh that is used is only used when there are scarcely any fry to be obtained. In the summer months the small mesh is taken from the net, and a large mesh is put in. The small mesh is only used in the winter season.

56,097. You do not use the small mesh the whole of the year round?—No.

56,098. In the summer season are you more likely to catch young immature fish?—Yes.

56,099. Then you do not catch many small fish?—No.

56,100. How do you reconcile that with the statement made to us, that large quantities of small whiting are caught?—That is not so. The small mesh is not used in the June season. If we were to use the small mesh, it would be injurious both to the owners of the boats and the men, because we should accumulate great quantities of sand, which would tear the nets out of the frames.

56,101. That would be done equally in the winter and the summer?—No, not in the winter.

56,102. For what reason?—From the coldness of the weather. The sand becomes firmer and harder at the bottom; we scarcely get any in the winter, only in the summer.

56,103. Both for the convenience of working the net, and in order that you may not catch immature fish, you do not use a small mesh in summer?—It is

not because we do not want to catch immature fish, but because we do not want to lose a portion of our nets.

56,104. It is not to avoid the capture of immature fish, but to facilitate your own operations as fishermen ?—Yes.

56,105. Do you think there is a large destruction of small immature fish by the use of that net ?—Not in the winter season.

56,106. Do you not catch small fish ?—No, there are only marketable fish caught in the winter season.

56,107. In the summer season do you catch the small fry of fish ?—Yes ; however large the mesh would be there would be a portion of the fry of the fish caught among the large.

56,108. Is it because your trawl-boats find it to their advantage, that they do not use that small mesh in the summer season ?—Yes.

56,109. As a matter of rule, they do not ?—As a matter of rule, they take away the small mesh entirely. If any one retains it, it is to his own disadvantage.

56,110. Then the small mesh is not used in the summer at all ?—Not as a rule.

56,111. In the winter you say you sometimes catch a proportion of fry with the large mesh ?—Yes, it is in the winter that a portion of fry is caught with the large mesh, but it is only a very small proportion.

56,112. Do they most of them have two trawl nets? —Yes, two trawl nets ; one has generally a large mesh, and the other a small. It is according to the place where we are fishing ; whiting are only taken about certain parts of the coast.

56,113. Is the same size of beam used for both ?—Yes, it is the same frame that the net is fastened to.

56,114. (*Mr. Lefevre.*) There are two kinds of net ? —Yes, one has larger meshes for the tail part of the net and the other small ones.

56,115. Do all the trawlers from Liverpool and Hoylake have these two kinds of nets ?—Yes ; when the fry are most frequently on the coast they use a large mesh, so that the fishing may not be detrimental. It would injure both owner and men if they were to use a small mesh, or if they were to have a mesh any larger than they generally use.

56,116. What is the size of the mesh in what you call the large nets ?—There are several sizes of meshes in the net.

56,117. But I want to know the smallest size ?—In the back part ?

56,118. Yes.—About $1\frac{1}{4}$, I think. That would be the size of the kibble that the net was made upon.

56,119. Do you mean pulled out, or from knot to knot ?—From knot to knot.

56,120. Would it be $2\frac{1}{2}$ inches pulled out, and $1\frac{1}{4}$ from knot to knot on the line ?—Yes.

56,121. That is the smallest mesh used in the large meshed net ?—Yes.

56,122. What is the smallest sized mesh that is used for catching whiting ?—The last that the net is made upon will be three quarters of an inch and from that to one inch.

56,123. Would you attach much importance to any regulation as regards the size of the mesh of the net ?—Not in the least.

56,124. You think the fishermen themselves, from their own interests, would be likely to adopt such a mesh in the various seasons of the year as would be most advantageous to the fishing ?—Yes, it has always been the case for the last 10 years.

56,125. Have you found, in the course of your experience as a fisherman, that there is a larger demand and a better price for small sized fish than there was some years ago ?—There is a larger demand ; the population is much larger, and the increase of boats has not been in proportion.

56,126. Can you get a price for the small fish that formerly you could not get ?—Yes.

56,127. In that way you are tempted to take smaller fish and bring them to the market ?—No, it is the whiting we catch. In the winter season we should not procure half a livelihood, if we did not use the small mesh to catch whiting.

56,128. Is it a fact that the whiting during the last winter have much diminished in quantity ?—Yes, this last winter they did not frequent the coast so much. They are a fish which come to the coast and then leave it.

56,129. You do not attribute it to over-fishing ?—No, because formerly there were no whiting on the coast.

56,130. Two years ago you had a large fishing of whiting ?—Yes.

56,131. You expect them to return again ?—They may return again more plentifully than ever. I hope they will this winter.

56,132. You do not attribute the decrease of the whiting to the size of the mesh of the net you use ? —Not in the least.

56,133. What is your experience in regard to the quantity of fish that are to be caught on the fishing banks between this and the Isle of Man—has it increased or diminished within the last 15 years ?—It has not diminished with me.

56,134. Can you get as good a living as ever you did ?—I can make a better living now than ever I did.

56,135. The haddocks have to a great extent disappeared ?—The haddocks at one time never visited the coast at all. There was a quantity of them that visited the coast for some period of time, but not for any great length, and then they entirely vanished.

56,136. Is there any other kind of fish that has in a marked manner diminished on the fishing banks that you frequent ?—No, I have never taken any notice of anything of the kind. The last season or two I had a better fishing of soles than ever I have had during the time I have been trawling.

56,137. You heard the evidence of the previous witness that not only was the quantity of the different kinds of fish caught by the trawl vessels on these banks very much diminished, but that the quality too, as regards size, had also diminished—is that the result of your experience ?—My experience is, that I have caught more during the last two years than ever I caught before, but I admit that greater exertions have been made.

56,138. In what way have you used greater exertions,—have you visited new fishing grounds ?—No.

56,139. You have been upon the same fishing grounds ?—Yes.

56,140. Have you stayed longer on the grounds ?—No.

56,141. Then in what way have you been using greater exertions ?—We have been going out oftener.

56,142. You have been oftener on the grounds ?—Yes.

56,143. You have worked harder ?—Yes. We are obliged to work harder at the present time than we did formerly. Within my experience, it was a common case for a fisherman to go out and catch a quantity of fish, and bring it to the market, and accumulate as much as would allow them to be in stock for a week or a fortnight. They cannot do that now, if they are anxious to procure an honest livelihood.

56,144. That would show that there is not as many fish to be taken in the same time and with the same exertions ?—There are as many fish to be taken, but there are more boats to take them. The boats were able formerly to accumulate more money from the quantity of fish they caught.

56,145. Then is it the case that the fishing grounds are as productive as ever they were, but that individual boats may not get as many, because there are more boats fishing ?—I think that is the substance of the whole.

56,146. The ground is limited, and there cannot be more than a certain number fishing to a profit upon it ?—There are a greater number of boats and there are larger nets. They must have larger nets to pay the owner, because the boats are now 50 tons, and they take more to keep them up in wear and tear than the boats of 30 tons. They must have

LIVERPOOL.

W. Langharne.

3 October 1864.

larger boats and larger beams, or the owners would have to give up their property at a loss.

56,147. (*Mr. Caird.*) Have you fished over the same ground for successive days ?—I have.

56,148. Do you find that they give way in the yield of fish ?—Yes, some portions of the coast will not yield as much fish, but it has always been customary to visit one place at one time and then another, and we go in search of them if they leave the coast.

56,149. If you change your ground, you think you can come upon them ?—Yes ; experience teaches us that some boats come upon good catches, whereas others only get little, not being at the same place.

56,150. What information can you give us in regard to the small trawl-boats ?—I can give no information in regard to those boats, except that to alter their mesh upon the part of the coast where they fish would be detrimental to them.

56,151. Would it be detrimental to the supply of fish to the market ?—It would of the class of fish they supply to the market.

56,152. That smaller class of fish which they catch would be lessened in quantity ?—Yes, if they altered their mesh.

56,153. If they made the mesh larger, would they not catch those fish ? — No ; the large ones do not frequent where they fish, and they would have to go home penniless.

56,154. You say they would not catch as many of that smaller class of fish ?—Yes.

56,155. Would not their not catching that smaller class of fish permit them to grow to a larger size and increase the supply ultimately ?—That would depend upon circumstances. That would depend upon whether the fish altogether escaped or not. There are many times not small quantities, but great quantities of what we call dirt or rubbish.

56,156. What is that ?—Weed of one description or another.

56,157. Not fish ?—No, it chokes up the mesh and retains the small fish when they go into it, and they cannot make their escape when the mesh is not open. When the net is being pulled through the water it is drawn together tight, and there is no opening for the fish to escape out of.

56,158. In that way does it occur that a large quantity of small fish is taken ?—Yes.

56,159. Do you not think that injurious to the general interests of the fishery ?—Yes, no doubt it is injurious to the general interests of the fishery.

56,160. You think so ?—I do think it is injurious to the general interests of the fishery, both to us and them also. Those who are occupied with the small boats, if they would catch great quantities of large fish, would bring them to the market, but where they fish there is not a sufficient quantity of large fish to support them; they would have to leave off altogether.

56,161. I understand you to say, that if they were prevented from catching small fish, it would be a serious injury to them ?—Yes.

56,162. Would that be compensated by the increased quantity of large fish brought into the market ?—I don't know.

56,163. It would increase the supply of large fish ? —Yes.

56,164. Would it increase in a degree corresponding to the loss of those fishermen who fish in the smaller boats ?—There is no doubt that it would increase the large fish that would be brought to market.

56,165. But you have already stated that you do not see any diminution in the yield of fish on the banks which you as a deep-sea trawler frequent ?—I do not.

56,166. If there is no diminution from the mode of fishing you carry on and have carried on for many years, when there was much less of this small trawl-fishing, how can you anticipate that it could improve your fishing ?—It has not improved my fishing, except by the fresh exertions which I have made.

56,167. Do you think the small fish, if they were not caught, would resort to your deep-sea ground ?—There is not the least doubt about it.

56,168. Then the result you bring us to is, that the catch of those small fish is injurious to the deep-sea trawling ?—Yes, most undoubtedly.

56,169. Is there a mode by which that could be prevented without any injury to the general supply to the market ?—I cannot see what mode could be devised.

56,170. You do not see how it could be done ?—No.

56,171. Not by any alteration of the mesh ?—No.

56,172-3. Nor by any close time being established to prevent fishing during the season the young fry come into the shoal water ?—There may be a time when the fishing might be prohibited, but I must speak fairly on both sides. If you were, all at once, to close the fishing, and if they were all to turn shrimpers instead of trawlers, then the shrimps would be at a very low price in the market. That is the reason they resort to trawling to catch fish instead of shrimps, because they are brought down to such a low ebb.

56,174. Have you been a shrimper ? — Yes, for many years.

56,175. By fishing for shrimps over the same ground, do you cause any increase or diminution in the supply ?—There has been no diminution in shrimping since I can remember.

56,176. Then is it the case, that the number of people employed in shrimping has increased ?—Not much.

56,177. There is no falling off in the catch of shrimps ?—No, none.

56,178. Does the price of shrimps vary much ?—Yes, it is sometimes down to threepence a quart and sometimes up to sixpence a quart, just according to the quantity caught.

56,179. (*Mr. Lefevre.*) Do they not fetch as much money in the months of August, September, and October ?—In August, September, and October they vary in price, the same as they do all through the year. In the winter they are more stationary, because they are scarce on account of the frost.

56,180. (*Mr. Caird.*) Have you fished for shrimps both with a bow net and a trawl net ?—Yes.

56,181. Which is the most effective in catching shrimps ?—What we call the shank trawl net. It was first used at Hoylake to catch prawns or shanks, and it derived its name from them. In one of those trawls they will catch as much in a day as a bow net will catch in two.

56,182. Then it would be a great injury to the shrimp fishery if they were prohibited from using that kind of net ?—It would be a great injury, no doubt. I have used both, and we could scarcely make a living with the bow net, where we could earn 5*s.* or 6*s.* a day with the shank trawl.

56,183. Does the shank trawl catch more of the fry of the fish ?—It catches more than the bow net, for this reason,—the length of the beam is on the average 24 or 25 feet, whereas the other is only from 11 to 14 feet.

56,184. It is the length of the beam that affects the thing more than the description of net ?—The length of the beam and the form of the net enable them to catch more than by the bow net.

56,185. Is there a great destruction by the use on the shrimp trawl ?—There is, no doubt, a destruction on this river.

56,186. Do you think that shrimping or small boat trawling is most destructive of the fry of the fish ?—I should consider that the small boat trawling was most destructive, because the small soles do not resort so much to where they catch the shrimps.

56,187. More destructive to the fry of soles ?—Yes.

56,188. But how is it with regard to the fry of all kinds of fish ?—There are many small fish caught by it, but I cannot describe the names of them. There may be some few small flat-fish.

56,189. Would it be ever possible to fish for shrimps at all without some destruction of fry?—It would not. The mesh we require to retain the shrimps is very small.

56,190. Is it impossible to carry on a system of shrimping without a certain degree of destruction to the fry of fish?—Yes, it is impossible. The mesh is so small that we could not avoid catching fry along with the shrimps. No close time would obviate that.

56,191. (*Mr. Lefevre.*) Do you agree with the numbers that have been given us of the shrimpers, namely, that there are about 60 boats from here and Hoylake?—Yes.

56,192. There are 40 from Liverpool and 20 from Hoylake?—Yes.

56,193. Is there also shrimping along the Welsh coast, from Llandudno to Beaumaris?—They work for prawns.

56,194. Do the boats from Hoylake and Liverpool go for prawns there?—They go across the Ribble towards Blackpool.

56,195. Is there much shrimping there?—There are no prawns taken there; there are a great many shrimps taken.

56,196. Has that gone on for many years?—Yes, before my time. There were not as many boats as there are at present.

56,197. How many men are employed in those shrimpers?—Only one man and a boy, often.

56,198. How is it on board the small trawlers?—Generally the same thing.

56,199. Then I understand that you would not have any regulation with regard to the small trawlers, to prohibit them from fishing during certain months, or from using any but a certain size of net,—you would recommend no such regulation?—I would recommend no such regulation, as it would materially injure them.

56,200. What would be the effect of a regulation restricting you from fishing in the bays between the headlands?—Drawing a straight line from the headlands?

56,201. Yes.—That would not hurt me at all.

56,202. Your boat does not fish much within the headlands?—No, it does not.

56,203. Have you fished much in Cardigan and Carnarvon Bays?—No, not myself.

56,204. Have you a boat of your own?—No; I had formerly.

56,205. You work as the master of a vessel?—Yes.

56,206. Have you found that, within the last few years, you have made as good earnings as you used to make?—Yes; I have made better earnings the last two years than when I was fishing before.

56,207. (*Mr. Caird.*) You said it would be disadvantageous to the small boat trawlers to put a stop to their mode of fishing?—Yes.

56,208. That I quite understand; but with regard to the general interests of the fisheries, and the supply of fish to the public, what would your answer be?—There would be a greater supply of larger fish.

56,209. Would there be a greater supply altogether?—There would be a greater supply of larger fish. There would be a greater quantity, either in bulk or weight. An opportunity would be afforded to the small fish of growing into large ones, and we should have them large instead of small.

56,210. (*Mr. Lefevre.*) If you caught them?—Yes.

56,211. What would be the effect of a regulation as to the size of your mesh and beam, and the weight of the head-irons and foot rope,—are any such regulations necessary?—No. The addition to the foot rope is employed to make it last longer. The object is not exactly to add to the weight, or to make it heavy, but simply to make it last longer. We put some of our old ropes round the foot rope, which, of course, makes it heavier.

56,212. Is there any reason why you should be limited as to the weight to be put on your ground-rope?—None at all; and with regard to the head-irons, in the summer season they have summer heads, and in the winter season winter heads. I never used them, however, but there are parties who have two pair of heads, and they put the lighter ones on in the summer season, because the winds are so much lighter.

56,213. With regard to the beam, you would not have a beam greater than a certain length?—It would be very injurious to us if we had a shorter beam.

56,214. What is the size of the beam you use?—Forty-seven feet.

56,215. You do not wish to be restricted to a 38-feet beam?—That would be detrimental to us.

56,216. With regard to the size of the mesh, if you were restricted to a mesh of $1\frac{3}{4}$ inches from knot to knot, what do you think would be the effect of that?—It would be very detrimental to us. The soles we are catching now are termed small soles in the market, but not anywhere else. They are only so called among the market people. They take the larger ones from the smaller ones, and if they have two soles that will not make a pair, they call them little, although they may be of a good size, and half a pound weight each.

56,217. How many inches are the soles?—It will take two of this length (*measuring*) to weigh a pound.

56,218. If you were not allowed to use a mesh less than $1\frac{3}{4}$ inches, you would be prevented from catching those fish that are marketable fish?—Yes.

56,219. Do they form a large proportion of your take?—We often get a great quantity of them.

56,220. Do the smaller class catch a great number of soles of that size?—It is very seldom they catch any larger than that.

56,221. Do they catch any that size?—Some of them, but not many.

56,222. What size are the soles they catch?—They catch very small ones, sometimes not more than three or four inches long.

56,223. Do they get any price in the market?—They do, according to how the markets are.

56,224. Are they sold to the poorer classes?—To anybody who likes to buy them. They are retailed out from standings in the market.

56,225. Are they bought mostly by the labouring classes, or by what class of people?—I cannot tell at all who buys them.

56,226. Is there a considerable demand for them?—Yes; many prefer them because they call them river soles. They consider river soles to be sweeter than those caught in the deep sea.

56,227. (*Mr. Caird.*) There is a preference for that kind?—Yes. They call the soles they catch river soles, and they are sold under that designation.

56,228. (*Mr. Lefevre.*) Are they the same soles you catch in the deep sea?—They are the same class of soles.

The witness withdrew.

George Davis called and examined.

56,229. (*Mr. Caird.*) You are a Hoylake fisherman?—Yes.

56,230. Have you practised both trawl-fishing and shrimping?—Yes.

56,231. Fishing with the small trawl and shrimping?—Yes.

56,232. You have practised the whole of the different kinds?—Yes.

56,233. You have heard the evidence which has been given to us by the deep-sea trawlers?—Yes.

56,234. Do you admit that there is any serious injury done to the fishing by your mode of fishing with the small trawl in the shallow waters?—Yes, I think there is a great deal of injury done by the shrimp nets.

56,235. We will take first the trawl nets used by

LIVERPOOL.

G. Davis.

3 October 1864.

the small trawlers.—The mesh that the small boats have is the same mesh that the large boats have.

56,236. You do not use a different mesh?—There is very little difference; I don't suppose there is half a knot difference.

56,237. But half a knot may be a considerable difference in a small net?—They don't set their nets as we set ours. When the small trawlers set their nets with 50 meshes, the big ones set theirs with three score or 60 meshes at the bag end to begin with.

56,238. Do you catch with your small boats any large proportion of fish unfit for the market?—Sometimes, in the months of July, August, and September.

56,239. Do you catch a larger proportion of these small fry than you did when you were fishing with a deep-sea trawl?—Yes.

56,240. Much larger?—Yes, because when we are fishing in 20 or 22 fathoms of water, we don't get many of them. They are in shallow water of eight or nine fathoms.

56,241. Is there much of that small fish that you catch that is unfit to be taken to the market?—Yes.

56,242. What do you do with it?—Shovel it overboard.

56,243. Is it alive?—No, because it is no sooner out of the water than it is dead. I believe there are very few that ever live.

56,244. Is there a large destruction of fish by that mode of fishing?—There is a good deal at times.

56,245. Has that been the case for many years within your experience?—It has been the case for the last 14 or 15 years.

56,246. Has it shown any injurious effect upon the fishing of the better class of fish?—Yes, a good deal.

56,247. Is there any mode by which it could be prevented, except by putting a stop to the fishing altogether?—The only mode by which it could be prevented is to put a stop to the shrimp nets. When they are fishing upon the banks, they catch small plaice and flukes not that length (*measuring*). They have drawn out six or seven hundredweight of them along with the shrimps caught in the shrimp trawls.

56,248. Is there a greater destruction by the shrimp trawls than by the small trawls?—Yes, a great deal.

56,249. How could you prevent that, except by stopping shrimping?—The only way to prevent it would be to make them shrimp within certain limits.

56,250. Limits of space or time?—Limits of space where the fry frequent.

56,251. Would it be possible to lay down such limits?—I have known places where the boats fished where they caught very little fry, and at Elbury I have known them throw away all that they caught.

56,252. At what time of the year?—In July and August.

56,253. Is most injury done in July and August?—Yes, or September, because most of the fish spawn in the months of April and May.

56,254. Is there any mode, by using a shrimp net with a certain size of mesh, that would prevent the catch of small fry?—No; I don't see that there is, unless they were required to use the bow net, instead of the trawl net. Then they would not catch near as many shrimps, nor as many fry.

56,255. But they would catch some fry?—Yes.

56,256. By any mode of fishing for shrimps you would catch fry?—Yes.

56,257. Does shrimping bring in a good deal of money to the shrimp fishermen?—Sometimes.

56,258. Is it more profitable than any other mode of fishing?—They may make sometimes 6*d.*, 8*d.*, 9*d.*, or 1*s.* a quart, and if they can get ten or twelve quarts of shrimps they can make a good day's work out of it.

56,259. Can they generally make good earnings by the shrimp-fishing?—Yes, unless in the depth of winter, in the frosty weather. At that time the shrimps all go over head in the ground, and they are very scarce until the frost goes away.

56,260. The shrimps have shown no signs of diminution on the whole?—No, I don't think they have.

56,261. (*Mr. Lefevre.*) What have you been doing lately; have you been working with a trawl?—Yes; for the last 10 years I have been trawl-fishing.

56,262. In the larger class of trawlers?—Yes.

56,263. You do not represent the interests of the smaller class of trawlers?—I was brought up to it.

56,264. But for the last 10 years you have been engaged with the large trawls?—Yes.

56,265. Are there any men connected with the small class of shrimpers here to-day?—No, I do not think there are.

56,266. Do you think that you represent what they would state about the matter?—They would only represent the same that I have mentioned to you. I used to go with the large boats in the winter time, and the small ones in the summer.

56,267. But for 10 years you have been almost exclusively in large boats?—No; but for six years I have been regularly in them.

The witness withdrew.

A. Tyrrell.

ANDREW TYRRELL called and examined.

56,268. (*Mr. Caird.*) Do you hold an office connected with the fish market in Liverpool?—I do.

58,269. What is it?—Inspector of Fish.

56,270. Have you been long in that office?—Twenty-two years.

56,271. Has the supply of fish within your experience, from the fishing vessels off this coast, increased or diminished?—It has diminished very materially.

56,272. The total supply?—Yes, the total supply.

56,273. Have you any access to figures or books that show that with certainty?—Yes; we keep a weighing machine, with which we used to weigh all the soles that came to the market.

56,274. Have you books showing with accuracy the weight of the fish for a succession of years?—Yes, every year.

56,275. Can you give us those returns?—Yes.

56,276. Can we depend upon them altogether?—I can show you that the quantity of fish that came into our market 20 years ago is a great deal more than it is now.

56,277. Do you refer to all kinds of fish?—To soles particularly.

56,278. Twenty years ago, was there a larger total supply of fish to the market of Liverpool, from all sources, than there is now?—There was altogether from our Liverpool fishing boats, embracing Hoylake and Southport.

56,279. Not inclusive of the supply derived from the east coast or from other quarters?—We have had a great supply from the east coast and from Ireland of late years.

56,280. Then your increased supply has been derived from other quarters?—Yes.

56,281. Are you taking increasing quantities from the east coast?—Yes, great quantities.

56,282. And increasing quantities?—Yes, every year. This year it has decreased a little.

56,283. What has that arisen from?—I cannot tell. As much fish has not come into the market yet.

56,284. You say that soles have specially fallen off in quantity, as supplied by your own vessels?—Yes; if our markets depended on the Liverpool boats we should have a poor supply.

56,285. Have any other kinds of fish much diminished?—Turbot, brill, and whiting. Haddock has completely left the coast for years.

56,286. How is it with regard to cod?—Codfish is not much caught about this coast; it comes prin-

cipally from the Isle of Man, and Ireland, and the east coast.

56,287. Has there been a great difference in the quality of the soles in the last 20 years caught by your boats?—For the last 10 years there has been a deficiency in the quality.

56,288. Have they been very small?—Yes; I should say the quality will run from eight to ten soles to the pound: they are very small. I have seen them fetching baskets of turbot to the market that would not be more than the size of a half-crown or a five-shilling piece. I think it was a sin to catch them, even in our deep-sea fishing boats.

56,289. Did they find a market?—They did. We have no law to prohibit them from fetching them in.

56,290. Were they readily sold?—Yes; they sell them probably for 2*s*. 6*d*. a basket.

56,291. Those small turbot?—Yes.

56,292. You say they came from the deep-sea trawlers?—The deep-sea trawlers have brought them in as well as the others.

56,293. Formerly, they did not bring them in?—No, they did not.

56,294. Do you know whether they caught them?—I do not think they did; their mesh was larger then than it is now.

56,295. Has the proportion of those small soles greatly increased, as compared with large soles?—They have increased in the last few years more than ever I knew.

56,296. Has that increase been more than equal to the diminution in the larger soles?—It has in one way; but the increase of small soles has diminished the large ones,—the large ones are not as plentiful.

56,297. Has the diminution of the large ones been made up by the quantity of small soles brought to the market?—No.

56,298. Has the price of fish altered much in consequence of the falling off of the native codfish?—It would if we had not had a good supply from other quarters.

56,299. Has the price not materially altered?—It has not.

56,300. Is it much the same now as it was some years ago?—Yes, it is much the same as some years ago. It is liable to vary, according to the quantity of stuff that comes into the market. If a hundred baskets of soles are sent from the east coast, it lowers the price of the fish sent in by the Liverpool boats immediately.

56,301. But, comparing the supply to the population of Liverpool now with what it was 10 years ago, are the people here supplied with fish at much the same cost now as they were then?—Yes, and even at a cheaper cost.

56,302. The fish are cheaper?—Yes.

56,303. They are more plentiful?—Yes.

56,304. Come from whatever source they may?—Yes; there is a great quantity coming from Ireland.

56,305. (*Mr. Lefevre.*) Twenty years ago, was all the fish landed at Liverpool sent to the market?—Yes.

56,306. Is that the case now?—No.

56,307. Then the returns you give us cannot be relied upon as showing the comparison of the takes of the Liverpool trawlers?—No; they land some now at Fleetwood, which go in that way to Manchester.

56,308. And some are sent to shops, and not to the market?—Yes.

56,309. So that a comparison of the returns with 20 years ago would not give a true comparison?—No; there were only three shops in Liverpool 20 years ago, and now there are 50.

56,310. Then the returns would be of no particular value?—From different parts of the country they send direct to the shops.

56,311. Then the returns would be of no value as showing the take of soles?—They would only show what is brought into the market now and what then; but not one per cent. comes in now compared with 20 years ago.

56,312. Not one per cent.?—No, not one per cent.

56,313. Has it fallen off as much as that?—Yes; there is not a Liverpool fishing boat that has had a hundredweight of soles for the last six months.

56,314. Do all the Liverpool trawlers send their fish to market?—It principally comes to the market; none are sent to the shops, except, perhaps, from one boat or so.

56,315. Do the Liverpool trawlers now land their fish at Fleetwood or other places?—They do sometimes, when they are weather bound.

56,316. Did any supply of flat-fish formerly come from Galway and other parts of Ireland?—We have had fish from Galway.

56,317. Flat-fish?—Flat-fish, soles, turbot, and salmon.

56,318. Has that fallen off within the last two or three years?—No; we get a good supply in that way yet.

56,319. Even this year, have you had a supply from Galway?—I have not seen any supply of flat-fish from Galway this year; but there has been a good deal of salmon.

56,320. Can you tell us anything as to the supply of oysters?—The supply of oysters has not been so good for years back; but I think they will be better this year than ever they have been, as there are great quantities coming from the west coast of Ireland.

56,321. And also from Beaumaris?—There is a large quantity laid down there which have been brought from the east coast of Ireland, from Wexford and Arklow.

56,322. When do they come?—All the year through.

56,323. All the twelve months?—Yes.

56,324. During the close season?—Yes. All the other beds are closed except those at Beaumaris; I do not know how it is they allow them to be open.

56,325. Do you know the Beaumaris beds?—Yes.

56,326. What sized oysters are they?—They are very large ones.

56,327. What is the size of the beds?—Fifty acres, if not more.

56,328. Are they all the property of one man?—No; they are divided in beds, separated from one another by a bit of a ridge formed of stones.

56,329. Do you pay for them?—Yes, we pay the Corporation for each bed, and 2*l*. a load for the year.

56,330. You buy the oysters from Arklow and Wexford?—Yes; they come by the packet.

56,331. Was there any attempt made to prevent their selling oysters in the close season from Beaumaris?—Yes, they stopped them at one time; but they allowed them to go on again. They seized one smack loaded with oysters in Beaumaris, but I believe it had only come from Arklow with a cargo fresh taken off the beds.

56,332. I suppose the oysters do not breed on the beds at all?—No; except they are down at low water in the deep.

56,333. Are they principally laid upon the ground between high and low water?—Yes.

56,334. Are there any laid down under the level of low water?—No, they would not get them then.

56,335. There is no dredging there?—No.

56,336. In what condition are the oysters in the close season?—They are large sized oysters, caught between Arklow and Wexford.

56,337. Are they in good condition for eating?—No, they are not in good condition; they are rather watery and thin.

56,338. Is there a good demand at that season for them?—No; they send them up the country.

56,339. What is the price during the close season?—Three shillings a hundred, or from 28*s*. to 30*s*. a thousand.

56,340. During the close months?—Yes.

56,341. What is it at other times of the year?—I have seen them as low as 18*s*. to 20*s*. a thousand.

56,342. Have you seen the oysters on the Beaumaris beds?—Yes; they have laid them there for years.

LIVERPOOL.

A. Tyrrell.

3 October 1864.

56,343. Are there many less than 2½ inches in diameter? What is the average size of the Arklow oyster when it is laid down?—I think the oysters laid down there would be about four inches across.

56,344. As much as that?—Yes; they are good-sized oysters. The Wexford oysters are large oysters.

56,345. Are the Arklow oysters as large?—They are smaller; they are about 2½ or 3 inches across.

56,346. Are there many less than 2½ inches?—There are.

56,347. Is there a great demand for oysters less than 2½ inches,—do they get a better price for them?—Of late years the demand has been from London and France; they take all the smaller ones, and would sooner have them.

56,348. Then the larger ones are taken for Beaumaris, and the smaller ones are sent to London and France?—Yes.

56,349. How long have they been laid down at Beaumaris?—They commence as soon as the close season is over in September; they commence laying them down in October.

56,350. When are they fit to eat?—They are fit to eat now.

56,351. After being laid down for how long?—Sometimes they only lay them down for a week, and sometimes they come direct from the beds, and sell them here.

56,352. Are the oysters fit for eating at once?—Yes, they are when the close season is over. In the month of September they are often fit for eating after having been dredged.

56,353. From the Arklow beds?—Yes.

56,354. (*Mr. Caird.*) Then is it only during the close season that they are placed on the beds at Beaumaris?—They are placed on the beds before the close season, but during the close season they fetch them from Beaumaris here.

56,355. Then the beds are only used for the purpose of having a quantity that can supply the market during the close season?—They supply the market from the beds all the year through. During stormy and rough weather they could not get them from Arklow. I may say that we get a great quantity of spring herrings in our market here during the months of January, February, and March.

56,356. Where do they come from?—They come from Lowestoft on the east coast. They are herrings that are caught with a very small mesh.

56,357. What is the size of those herrings?—They are not much bigger than the sprat. They come here in great abundance, and I am informed, by parties who send them to our merchants here, that they can buy them from twopence to threepence a hundred, and sell them there to manure the land.

56,358. What is the effect they have upon your market?—The effect they have is, to diminish the price, and they are of no earthly service.

56,359. Do people eat them?—Yes.

56,360. Do they buy them for food?—Yes.

56,361. Do they like them for food?—Some do. They sell them here for 1*s.* per 100.

56,362. Then they come largely into consumption by the poorer classes at that time?—Yes.

56,363. When other fish are not to be had cheap?—They would have to give more for other herrings.

56,364. Is that not of considerable advantage to the poorer classes?—Yes; but they are not good for them.

56,365. Do the poorer classes complain?—I have heard many say they are dry, and that they have nothing in them.

56,366. Yet they do buy them?—Yes; but if they were to remain for three months more they would be good food.

56,367. What effect have they on the market, that makes you complain of those fish coming here at all?—The effect they have on the market is, that I do not consider them good food at that season of the year, they are so small; but if they were allowed to run for three months more they would be useful to the working men.

56,368. But it appears the working men do get them here at that time, and that they do buy them?—Yes.

56,369. And that has some effect upon the general price of fish in the market here at that time?—Yes.

56,370. Does it depreciate the price?—Of nothing but herrings.

56,371. Are fish generally dear at that time?—No; they are no dearer than during other parts of the year, except in the warm months of the year. In January and February soles may come to 1*s.* or 1*s.* 3*d.* per lb.

56,372. What is the nature of your objection to those fish coming here?—I think they are not seasonable fish.

56,373. If you can tell us how it affects you here, we shall be glad to hear your opinion about it?—I consider that it affects the fishing in the summer time, when the fishing would be good.

56,374. It does not affect your fishing on this coast?—Not in the least.

56,375. (*Mr. Lefevre.*) There are no herrings off the Liverpool coast?—No.

56,376. There have not been for the last 20 years?—There have been a few taken by stake nets down at Crosby.

56,377. There has been no drift-net fishing?—No.

The witness withdrew.

W. Langharne.

William Langharne recalled and examined.

56,378. (*Mr. Lefevre.*) How many trawlers are there at Southport?—About 11.

56,379. How many small ones?—A great number.

56,380. Have they increased of late years?—I cannot say that they have. They are all in the shrimping line. They are boats that were set up for the herring-fishing at Fleetwood, but as it has failed for the last year or two they have returned to shrimping.

56,381. Are the larger class of trawlers of the same size as the boats here?—There are one or two of them of the same size, but not the rest.

The witness withdrew, and the inquiry was adjourned until the 4th of October, at Carnarvon.

Carnarvon, Wales, Tuesday, 4th October 1864.

PRESENT:

J. CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

LLEWELLYN TURNER, Esq., called and examined.

56,382. You are the Mayor of Carnarvon?—Yes.

56,383. You are well acquainted, I suppose, with the fisheries on this part of the coast of Wales?—I am, from the circumstance of being an old yachtsman and an old life-boat volunteer. I have been a good deal on the water.

56,384. Is there any important fishery here?—In our bay we have several beds of oysters, and there is a great quantity of very beautiful soles, and turbot, and other fish of that sort; and in their season, mackerel, and so forth.

56,385. Has the supply of fish here—the quantity caught—been increasing or diminishing of recent years, taking all kinds into account?—Well, judging from the reports of the fishermen here, which I don't think are particularly to be relied upon, they seem to say that the quantity of soles has rather decreased.

56,386. Are they much fished?—Yes, they are very much fished by the Liverpool and Hoylake fishing-boats, which are virtually the same thing. We sometimes see six, seven, or eight boats here for months together, especially with an east wind. They catch enormous quantities of fish, and send them to Liverpool.

56,387. They are deep-sea trawlers from Liverpool?—Yes.

56,388. Do they trawl in shoal water, or at a distance out?—They trawl at a distance. They trawl in the bay. The bay is pretty much in this shape (*pointing to a plan*), and they cross it at a distance of two or three miles from the bar. There is trawling ground along the Anglesey coast, and all about the bay, with the exception of some few patches, where there is rough ground.

56,389. Are there boats belonging to this place which trawl on the same ground?—There are a few boats, very inferior boats to the Liverpool boats, and they do not keep out so long, partly in consequence of the preference of the men to be at home drinking, and partly from their inferiority to the men in the other boats.

56,390. Is the fishing business an increasing business here?—Not among the people themselves. Some years ago there were beds of oysters discovered by some Jersey men, and we have always at Carnarvon about half a dozen very fine Jersey smacks. That is about the average number.

56,391. Are they engaged in oyster-fishing?—Yes.

56,392. About what part of the bay do you find the oyster beds?—There are different beds. There are beds down along this shore, and patches in different parts of the bay. I cannot exactly point out where they are.

56,393. Have they been long known to be in existence?—Yes. The oyster beds were discovered here, as far as I can recollect, about 15 years ago, or perhaps rather more than that; but for a short time, owing to a little local jealousy, they were not worked.

56,394. Are they held to be the property of the corporation?—No, they belong to the public.

56,395. Anybody may use them?—Yes; but at first, after they were discovered, and after the Jersey men came to use them, the trawlers of the place attacked them with their own vessels, and drove them off the ground; but I happened to be sailing out in my boat and put a stop to it, and had them all bound over to keep the peace. Ever since that time the Jersey men have come here.

56,396. Are the Jersey men the principal oyster fishers here?—Yes.

56,397.—Do the natives not fish them at all?—Not to the same extent.

56,398. What do the Jersey men do with the oysters?—They lay them down on beds on the banks in the Menai Straits.

56,399. And they take them away to Liverpool and other places?—Those that are put on the beds along the sea shore here, are sold here in great quantities, and are sent to Manchester and other towns by railway.

56,400. Has that become an important business?—There are about six Jersey vessels employed in it; and sometimes some of our own vessels go from here also.

56,401. The oysters do not breed, I suppose, on the beds on which they are laid in the Menai Straits?—No, they do not.

56,402. They are only brought there to deposit, and for feeding?—Yes, that is all.

56,403. Do they fatten there and improve?—Yes.

56,404–5. What is the average number of boats?—I think the average is five or six, and there are a few of our own boats; but as far as our own boats are concerned the men are very idle, and they never adhere to one class of fishing. The consequence is that they destroy the demand here. They go fishing for herrings, and from herrings to oysters.

56,406. How many fishermen and boats have you here belonging to the place?—I think there are not more than four or five boats.

56,407. Then it is a very unimportant business, so far as the trade of the place is concerned?—Yes, it is all done by foreigners and strangers.

56,408. With regard to the soles, you state that the people themselves say that the quantity has decreased of late years?—Yes, they say so; but I don't think that is the case myself. They attribute the decrease to the number of Liverpool boats that are trawling.

56,409. Do the people here themselves trawl inshore in the shallow water for soles?—No, they do not. I have seen it tried in the straits a little, but only to a small extent, not worth mentioning at all.

56,410. Do you think there is any destruction of spawn or fry caused by the mode of fishing followed here?—No; that I am not prepared to say. I don't know sufficient of the nature of fish to answer that question.

56,411. Perhaps you may have seen very small fish taken, so small as not to be marketable, and thrown away as waste?—No, I cannot say that I have.

56,412. Has the quantity of turbot taken off the coast diminished or increased of late years?—That I don't know.

56,413. You referred to the mackerel-fishing as being followed here sometimes; is it of any consequence?—They catch very considerable quantities of mackerel; but the season for them is rather late; it does not begin till the month of August. It is generally considered as being at its best in September. In August and September they are at the best perhaps. They come in July, but I know that it is a late fishery.

56,414. Do any but the native fishermen come for mackerel-fishing here?—No, they do not.

56,415. Then if it is confined to a small number of fishermen, it is a very small affair?—Yes. It is generally carried on by smaller boats than those I have alluded to; smaller boats than the four or five fishing vessels that I have mentioned. They go out to fish mackerel with lines. It is all a line fishery. A great number of boats go out for that, but they are not regular fishers.

56,416. Have you any herring fishery here at Carnarvon?—No, not at Carnarvon.

CARNARVON.

L. Turner.

4 October 1864.

56,417. Do you never have any here?—Not that I am aware of.

56,418. Nor anywhere else on the Welsh coast?—Yes. In Cardigan Bay. There is a great fishery there. They bring in immense quantities. There was a herring fishery here, and perhaps they catch a few now, but nothing in any quantity. They bring immense quantities of herrings from Pwllheli, and all along there. They bring them in Crickieth carts; immense quantities are caught there.

56,419. Is there a good herring fishery generally in Cardigan Bay?—Yes, and in this part of it. The fish are not in good season that we get from there. There is a herring fishery at Bangor also, but it is not nearly so good as it was.

56,420. Have you any shrimping along this coast, or in the straits?—There is very little here. Indeed, it has always been a matter of surprise with me, that, with so many sand banks here, there is so little. We never get any prawns, except at low-water at spring tides. We never get any at neap tides. The shrimping here is very little indeed. There is no shrimping at all, except that which is carried on by hand.

56,421. Being a yachting man, you have some knowledge of Cardigan Bay?—Yes, I have.

56,422. What is the nature of the fishery carried on there, and what are the principal stations for fishing there?—There is an immense quantity of sole, and turbot, and conger, and the same fish we have here, but by no means of such good quality; and that is shown by the fact that it does not keep near as well. The Cardigan Bay sole is a blacker-looking fish than ours, and when it is taken away for transportation across the country, when it is sent away for sale, it does not last so well; it decays sooner, and that is supposed to arise from the fact that ours is a cleaner bottomed bay than the other. They have a great number of beds of oysters in Cardigan Bay.

56,423. What are the chief stations for fishing in Cardigan Bay; is there any at Barmouth?—No, not at Barmouth; the only parts I can speak to are Pwllheli and Crickieth.

56,424. Are there any large fishing stations in the bay where there are boats and men?—At Pwllheli there are a great many small fishing-boats. A great many congregate there. Great numbers of Liverpool fishermen go there to fish.

56,425. We have had evidence of the Liverpool fishermen going into Carnarvon Bay to fish, and should like to have local evidence as well?—There is a gut or place called Sarn Badrig, a reef of rocks, that is supposed to be a submerged town. There is a tradition with regard to it to that effect; and there is a gut outside of Pwllheli where they get immense quantities of fish, but they are not good fish.

56,426. (*Mr. Lefevre.*) When did the Liverpool trawling vessels first come here?—They have been in the habit of coming here ever since I can remember.

56,427. Do they land their fish here generally?—They land a good deal of it here, and send great quantities by railway and steamer. They send great quantities by steamer from the bridge also.

56,428. Has the number of boats increased of late years?—Yes, I think it has.

56,429. Then looking at the increase of the Liverpool trawlers, do you say the quantity of fish in the bay has fallen off or not?—No, I don't think the fish have fallen off myself; but when people complain of the deficiency of fish, which is a great complaint, they assign as the cause that there is not so much fish; but I tell them they don't go to get it.

56,430. You think the Liverpool fishermen get it, and take it directly to Liverpool?—Yes.

56,431. What is their season for coming here?—They come all through the summer.

56,432. Is there any extensive line-fishing at this place?—No, nothing but mackerel-fishing to speak of.

56,433. Is there no cod fishery?—No, the cod-fishing is principally an in-shore fishing in the Menai Straits. Boats go out and anchor, and fish with lines; but I cannot call it a large fishery.

56,434. Do the oyster fishermen observe the close-time here?—Yes.

56,435. Do they observe any regulation as to the size of the oysters they take?—Not that I am aware of.

56,436. Do they take them of all sizes?—I believe so, but I cannot speak positively to that; but possibly the Collector of Customs can do so. I may mention in reference to the oyster-fishing here, that the oysters are of very different sizes. There are very large oysters, and very small oysters.

56,437. Lying on different beds, I suppose?—Yes; lying on different beds.

56,438. Do you think they are different kinds of oysters?—Yes; I think they are. It is rather a curious thing, but there is no mistake about the fact, that the Carnarvon Bay sole is a very superior fish to the Cardigan Bay sole, and that the Beaumaris oyster is a very superior oyster to our oyster.

56,439. But the Beaumaris oyster is brought from Arklow and laid down there; it is not indigenous to the place?—They have oysters that they dredge at Penmaur.

56,440. At Penmaenmaur?—No; at Penmaur, off Puffin Island.

56,441. Are there extensive oyster beds there?—I don't think there are.

56,442. Has the number of Jersey smacks increased or diminished of late years?—There are not above half-a-dozen of them altogether.

56,443. Then the number remains about stationary?—Yes, about stationary; perhaps there may be one or two more than there were at first.

56,444. Then you argue from that that the oysters have not decreased in consequence of being fished?—No, there is no appearance of it. At first when they came, there was a great run upon oysters, and there were a great many Carnarvon boats, as well as Jersey men engaged in it, when they could fish in fine weather; but when the Custom House enforced the close-time, then almost all the Carnarvon boats went out of the field.

56,445. I suppose that the Jersey boats are qualified to fish the bay in the winter time during the exposed weather?—Yes, they are much better boats; they are very superior boats to ours, and they are not only superior boats, but they are manned by a more respectable class of men—nice, tidy, sober men.

56,446. What sized boats are the Jersey boats?—About 30 tons.

56,447. What number of men do they carry?—They carry very large crews, much larger than ours. I think they carry six or seven men.

56,448. Do you know the number of dredges they use; do they use more than one dredge?—I don't know.

56,449. Is any complaint made by the fishermen here of their not being allowed to dredge the oysters during the summer months?—At first there was. At the time it was disallowed, they complained; but since then they seem to have abandoned the trade to the Jersey men. We hear nothing about it now; but they feel it a grievance, no doubt.

56,450. Is the bay so exposed that it is a matter of difficulty to dredge the oysters in the winter time?—In winter it is; but often in the month of September and October we have very fine weather. Of course that is not always the case.

56,451. Are the oysters which are laid down on the bed for fattening taken up during the close-time and sold?—Yes; all the year round.

56,452. So that there is a sufficient supply of oysters during the close-time for the market?—Yes; and I have heard a great deal of comment upon that. It is said that the Manchester people enjoy them exceedingly when they are full of milk.

56,453. I suppose the oysters are laid down on the ground between high and low water?—Yes.

56,454. Are any laid down below the level of low water?—No, none of them.

56,455. In the close-time are they in a poor condition?—There is a milky appearance about them.

56,456. But the public seem to buy them notwithstanding?—Not the public here. It is the Lancashire public who admire them.

56,457. Are there mussel beds in the bay?—Not in any great quantity.

56,458. Is there any flounder-fishing to speak of?—Yes; they get flounders; the trawlers get them with the soles and turbot.

56,459. Do they take any number of small flounders?—Yes; they get all sizes of fish. The men who fish for codfish when at anchor in boats in the straits sometimes catch them with their lines.

56,460. (*Mr. Caird.*) Have the wages of labour increased here much of late years?—Oh yes, very much.

56,461. Do you suppose that has had any influence in changing the pursuits of the people from fishing to other occupations?—No; I don't think it has. They are a sort of distinct class. It has not operated with those who were previously engaged in fishing; but it frequently may have prevented new men going into it.

56,462. Have you any idea what change has taken place in the ordinary rate of labourer's wages of late years?—Yes; you cannot get a man, generally speaking, under about 14*s.* a week. They get more in the quarries.

56,463. I suppose it has been in consequence of the operations in the slate quarries and the great demand for labour there that wages have risen?—Yes; in a great measure.

56,464. Do you think that fishermen, on the average, can earn as good wages as fishermen as if they went into the slate quarries?—Yes; I have no doubt whatever that sober men can, and that sober men do; but unfortunately the class of fishermen have got into bad habits, and have not stuck steadily to the fisheries at all.

56,465. (*Mr. Lefevre.*) Can you explain why it is that the two important fisheries here, the oyster fishery and the trawling outside, have fallen into the hands of strangers?—I think it is from having been taken up by an improvident class; and I have no doubt if we could succeed here in getting up a company of working fishermen, we should not only confer great benefit on the neighbourhood, but it might be made to pay very well if properly managed.

56,466. Do you know at what season of the year herrings come into Carnarvon Bay?—I don't know; but I think it is about June or July. They come, perhaps, not so early. Probably in July or August. I cannot tell exactly.

56,467. Do they come with regularity from year to year?—Yes, always.

56,468. How long do they remain in the bay?—Till about this time.

56,469. If trawling were prohibited within the headlands of the bay, would you have any supply of fish?—No, we should have to get it from Liverpool and Dublin. There is whitebait in the straits here at the Swilleys. It is capital whitebait.

56,470. How is it caught?—It is caught in the weirs.

The witness withdrew.

THOMAS TURNER called and examined.

T. Turner.

56,471. (*Mr. Caird.*) Can you give us any information as to the fisheries along the Welsh coast, and particularly in Cardigan Bay?—I can say nothing more than my brother has said with regard to the fisheries.

56,472. Do you think the increased rate of wages paid for labour in the slate quarries has had some effect in directing the attention of the natives to that source of employment, rather than to fishing?—I think in the herring-fishing it would, where they are a sort of mongrel labourer, as at Clanhire and other places along the coast, where the men are employed on both. They go at a certain time of the year after the herrings; but now there are various works all along the coast. For instance there is a large set work quarry.

56,473. What are sets?—They are for laying down as paving stones. The men have constant employment there, and would not go to an irregular thing like herring-fishing.

56,474. So there is constant employment for the labourer?—Yes; the labourer can get any amount of employment now anywhere.

56,475. May not that be the chief cause why fishing for oysters and trawling in the bays has gone seemingly into the hands of strangers?—I don't think that affects anything but the herring fishery. The oyster fishers and trawlers are a distinct class of men. It is a regular sailor who goes into the oyster and trawl-fishing.

56,476. Do you know whether the sons of these regular sailors continue to be fishermen, or do they go into the regular labour afforded in the neighbourhood?—No; I think they go as fishermen, or to sea as sailors.

56,477. (*Mr. Lefevre.*) How many fishermen are there here who are fishermen all the year round?—I think there are very few. There are not more than three or four boats, and there may be from 15 to 20 men.

56,478. Are the herring fishermen in Cardigan Bay fishermen all the year round, or only during the herring season?—I think they are only temporary fishermen.

56,479. Do they catch herrings at all with the seine-nets?—Yes, I think so.

56,480. Is it mainly with seine-nets that they fish?—Yes, they have two-ended boats.

56,481. With a net between two of them?—I think they lay them out with buoys.

56,482. Then that is drift-net fishing?—Perhaps it is.

56,483. (*Mr. Caird.*) They are not anchored, or fixed to the bottom?—Yes, I think they are laid out and fixed.

56,484. But they are not fixed to the bottom; they are allowed to drift with the tide?—I think they are fixed for a time. The fishermen then go out, take up the nets, and unmesh the fish which have meshed in them.

56,485. (*Mr. Lefevre.*) I think you said there was a herring fishery at Bangor some time ago?—Yes; they have weirs at Bangor.

56,486. When did that fishery cease?—It has not ceased. They catch herrings now on the Swilly rocks, and at Penrhyn as well.

56,487. At what time of the year?—About July or August.

56,488. Has that gone on from year to year?—Yes, ever since I can remember, and I can recollect as far back as 40 years ago. The fishing, however, is very uncertain. It depends upon the amount of herrings that come in.

The witness withdrew, and the inquiry was then adjourned until October 7th, at Tenby.

Tenby, Pembrokeshire, Friday, 7th October 1864.

PRESENT:

J. CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

TENBY.

J. Gifford.

7 October 1864.

JOHN GIFFORD called and examined.

56,489. (*Mr. Caird.*) You are a fish salesman here?—Yes; I have been a buyer of fish here for the last 20 years.

56,490. You are well acquainted with the state of the fisheries here and the supply of fish to the market in this neighbourhood?—Yes.

56,491. What are the principal kinds of fish that are bought here?—We get here all the various sorts of fish that are caught in the sea. They are brought to the market at one time of the year or another, such as brill, turbot, gurnard, soles, mackerel, dories, mullet, and fish of every description.

56,492. Cod?—Yes, codfish.

56,493. Have any of the different varieties you have mentioned been on the increase, or have they diminished in supply during the last few years?—The codfish has diminished in supply considerably, compared with what it used to be.

56,494. Is cod the only kind of fish that has diminished?—The herrings have got scarcer also: there used to be a large quantity caught when I first came here.

56,495–6. There is not a regular fishery of herrings at Tenby?—No.

56,497. When did cod begin to show any sign of diminishing?—They have not been so plentiful for eight or nine years as they were 17 or 18 years ago. They were caught in large quantities 20 years ago.

56,498. Are they caught with the long-line here?—Yes.

56,499. Have you heard any reason assigned as the cause of that diminution?—No, I have not.

56,500. With regard to the other fish you have mentioned, have they remained stationary, or are they increasing in the supply?—I think the supply averages one year with another, for the whole period of time I have been here, much about the same; taking one time with another, they are no scarcer.

56,501. Are they more plentiful?—No, and they are not more plentiful. There has been a larger quantity of gurnards this summer than I have ever seen; they have been the most plentiful fish we have been catching this season.

56,502. Gurnards are increasing?—Yes.

56,503. To what markets do the gurnards go? Are they fish of a cheap character?—Yes; we can hardly find a market for them.

56,504. Are they chiefly consumed by the lower classes?—Yes, and in the country as well. I think they are a very good fish.

56,505. Are they increasing in price?—No.

56,506. Are they diminishing?—No; they fetch the same price, namely, so much a basket.

56,507. Has that been the case for many years back?—Yes, for 20 years.

56,508. You say they have been caught in such an abundance that you could scarcely find a market for them?—Yes, this last summer.

56,509. How are they caught?—By a net—by the trawl net.

56,510. They are trawled fish?—Yes, and there are large quantities taken by the hook as well.

56,511. Are the soles diminishing?—They have been about the same they always were. We get a plentiful supply for two months.

56,512. What two months are those?—June and July.

56,513. They keep as good as they formerly were?—Yes.

56,514. In quantity?—Yes.

56,515. Do you get more small soles than you used to do, or are they about the same?—Much about the same.

56,516. How is it with regard to the price of soles?—They are about 3½*d.* a pound.

56,517. Are they increasing in price?—No.

56,518. Have they remained stationary for some years back?—Yes.

56,519. How is it with regard to turbot?—Turbot generally sells at a crown apiece for the large fish, and the other size will sell for about 6*d.* a pound.

56,520. How are they caught?—They are caught in the trawl.

56,521. Are they increasing?—Yes, there is a good supply of them; they are increasing, compared with what they were some years ago.

56,522. Are they as good now as ever you knew them?—Yes.

56,523. Do you get any haddock now?—Yes, occasionally in the summer. Sometimes we catch a great many in the winter time. They get them with the hook as well, but I think that they are not as plentiful, the same as the codfish.

56,524. They are diminishing rather?—Yes.

56,525. Has the price of the haddock kept about the same thing?—Yes.

56,526. I suppose it is regulated by the price of other fish a good deal?—Yes.

56,527. Do you get any flounders or flukes here?—No flukes, but plenty of flounders.

56,528. Are they increasing?—There have been large quantities caught all the summer.

56,529. Where do you find a market for them?—At Cardiff, Merthyr, Swansea, Neath, and other places where there is a large population of the working classes.

56,530. Do you say that the supply of flounders is increasing?—I think it has increased this summer.

56,531. And does the price remain stationary?—Yes.

56,532. Are there any oysters caught here?—Yes.

56,533. Are they caught in large quantities?—No, nothing like the quantities in which they used to be caught.

56,534. When did they show signs of diminution?—I think they have been getting scarcer and scarcer every year for the last ten years.

56,535. Have there been any new beds of them found?—Not that I am aware of.

56,536. Have the fishermen continued fishing on the grounds which have been fished for many years?—Yes.

56,537. Are they fished without any restriction of any kind?—I believe they are.

56,538–9. Is there any restriction as to the size of the oysters allowed to be brought ashore?—I believe not.

56,540. Is there any regulation as to the size?—I think not. I never saw anyone overhauling the boats to see if there were small oysters. There has been no regulation of that kind ever since I have been here.

56,541. Do you know if there are small oysters brought to the market here?—Yes.

56,542. Of what size is the smallest?—There are some about the size of a crown piece.

56,543. Is it thought by the fishermen themselves that that is destructive of the brood of the fish and the general supply of oysters?—I do not know whether they think so, but I do.

56,544. How do they sell the small description of oysters?—They are about a shilling a hundred here.

56,545. What is the price of the best?—Two shillings and sixpence—that is the wholesale price. I do not know what they get for them when they retail them about the town.

56,546. There is a perceptible decrease in the oysters?—Yes.

56,547. Did you formerly send oysters to other markets from this place?—Yes, to Bristol; that was the principal market.

56,548. Do you still send to Bristol?—I do not, but there are men who do still send to the Bristol market.

56,549. Do you know anything about the quantities of oysters taken in the season?—No, I cannot say; I never kept an account.

56,550. They do not fish them in the months of the close season?—Only from September up to March.

56,551. They observe that very strictly?—Yes, very strictly.

56,552. Does anybody enforce it?—I do not know if there is anybody to enforce it, but I never saw the men dredging from the last of March up to the 1st of September.

56,553. Is the close time to the end of March or April?—I think it is the end of April.

56,554. They may fish in every month with an "R" in it?—Yes.

56,555. That is the common rule?—Yes; they take the dredges out of the sea the very day the last month is up.

56,556. Are there any fish caught in the seine nets here?—Yes.

56,557. What kind of fish?—Every sort of fish you could mention.

56,558. Is the seine net much used?—Yes; but there has not been much caught with it this summer.

56,559. Are some summers more favourable for the use of the seine net than others?—Yes; it depends entirely on the weather.

56,560. Is it used along the shore?—Yes, if the weather would permit.

56,561. Do they fish for herrings with the seine net?—Yes, occasionally.

56,562. With regard to the herring fishery has there ever been an important herring fishery here?—Not that I am aware of.

56,563. There never has been an important herring fishery?—No, not an important one.

56,564–9. How many boats will there be engaged in the herring fishery?—I should say not more than four. I never knew more than four.

56,570. To what markets are the fish sent from Tenby as a rule?—Cardiff, Swansea, Merthyr, Neath, Newport, Gloucester, Cheltenham, Bath, Bristol, Birmingham, London, and anywhere there is a demand.

56,571. Do you yourself send fish to those inland markets?—Yes.

56,572. Are we to understand that, speaking from your knowledge and experience extending over a good many years, the supply you send inland from this place is not diminishing?—It is not diminishing at all. It is not less than ever it was, except with regard to codfish.

56,573. The general supply of all other fish has not diminished?—It averages near the same.

56,574. Is it increasing?—No.

56,575. It keeps much about the same?—Yes.

56,576. That is shown by the boats keeping about the same in number?—There are more boats than there used to be.

56,577. Do not those additional boats catch more fish?—They are sure to catch more.

56,578. Then your supply will be increasing?—They do not all fish for this market. Some run away to Swansea with the fish.

56,579. Has the market changed in any way since the opening of the railway to other places?—Yes, we could send only twice a week by packet until we had the railway.

56,580. Has the opening of the railway very much facilitated the getting of the fish to the market?—Yes.

56,581. Has the opening of other railways in other districts prejudiced you in any respect?—Yes, I think so, as to the demand for codfish. They can get it in from the markets from the north as quick, and even quicker than we can here.

56,582. Does any other fishing station on the north side of the Bristol Channel export as much fish inland as you do?—I do not think so.

56,583. (*Mr. Lefevre.*) Do the Brixham boats bring in their fish here?—Some of them do, but they mostly go to Swansea.

56,584. Has the number of Brixham boats that fish off here increased of late years?—No; they average about the same; there may be a few more in some years.

56,585. What has been the increase?—There has been an increase of several boats.

56,586. But of those, some of them send their fish to Swansea?—Yes.

56,587. When you spoke of the supply being about the same, did you mean the supply brought into Tenby itself, or did you mean that by all the boats fishing off here the whole supply taken had increased?—The more boats there are on the ground, of course the more fish is caught. The quantity of the fish in the sea averages nearly the same.

56,588. When did the haddock begin to fall off?—About a dozen years ago.

56,589. Has it very much fallen off?—They never were very plentiful,—not in the winter. Some boats may have caught five or six with the codfish on the same lines.

56,590. Are they ever caught in the trawls?—Yes, in the summer large quantities are caught.

56,591. In what condition are they then?—Very good.

56,592. Are they caught in the deep water?—Yes, out in deep water.

56,593. Have the whiting fallen off?—Sometimes we get a hamper or two about the month of August; they are very small whiting.

56,594–5. Are they caught in the trawls?—Yes.

56,596. Do you know what number of boats are engaged in line-fishing?—They may average about 20 boats when they are all at it in the winter.

56,597. Has that number fallen off of late years?—No, it has rather increased.

56,598. Do they depend mainly on cod and haddock?—Yes, and oysters.

56,599. Are the same boats used for oyster dredging during the part of the season and for line-fishing during the rest of the season?—Yes; there are one or two small boats that fish for cod only, and not for oysters.

56,600. When did the oysters begin to fall off?—They have been falling off every year for the last 12 or 14 years.

56,601. Have you observed a greater falling off during the last three or four years?—Yes.

56,602. Is that due to there not being any spat for the last three or four years?—I do not know.

56,603. Do you know if there has been a good spat here?—I do not know.

56,604. Are oysters brought here for the purpose of laying down on other beds?—Not of late years.

56,605. Are they sent to the market at once?—Yes.

56,606. Is there no smaller class of oysters brought in not fit for eating at once, but which are laid down on beds?—No; there have been none laid down on beds that I have seen.

56,607. Are all of those that are brought in fit for the market?—Yes, and they are generally sold here.

56,608. Are there any so small that they are not fit for the market?—No; they manage to sell them whether they are too small or not; but they would not answer my purpose to send to the market.

The witness withdrew.

TENBY.

R. Parrott.

7 October 1864.

ROBERT PARROTT called and examined.

56,609. (*Mr. Caird.*) You are a Coastguard officer here?—Yes.

56,610. You have been stationed here for some years?—Yes.

56,611. You are well acquainted with the fishing in this bay?—From my position in the service I have been enabled to see the vessels coming in and out.

56,612. Can you tell us the number of boats engaged in the fishing here?—No; but I can tell you the number of boats here which may be said to belong to Tenby at present.

56,613. What is the number?—Thirteen.

56,614. Are they open boats?—No, trawlers.

56,615. There are 13 trawlers?—Yes.

56,616. Decked trawlers?—Yes, decked trawlers.

56,617. Belonging to Tenby?—Yes, they may be said to belong to Tenby. Some of them belong to Milford, but the men who work them reside here.

56,618. Are there any other trawl-vessels that fish here besides those 13?—During the summer season the Brixham boats come here.

56,619. How many of them?—I think there were about 17 or 18 this year.

56,620. How long do they remain here?—They come generally about May, and stop till the latter part of September.

56,621. Is there any particular kind of fishing followed by the trawlers at that season of the year?—No.

56,622. Are the fish all in-shore or in deep water? Is there any distinction in the mode of fishing then and in the winter season?—In the winter season they confine themselves to the bay, and in the month of August they gradually draw out to the channel.

56,623. The trawlers?—Yes.

56,624. Did you ever hear the Brixham men give any reason for coming during those particular months, and not during the rest?—No, I never heard any reason assigned, but I believe it is because they consider the ground is not enough, or the water as deep as it is in the English Channel. The same parties come here almost every year, and they have been here for the last 20 years, and their fathers before them.

56,625. You do not know why they come at a particular time?—Because the fish are more plentiful in the summer time.

56,626. Do your own fishermen find the fish more plentiful in the summer time?—Yes.

56,627. Are the fish more in the bay in the summer or further out at sea?—In the early part of the summer the fish are in the bay, but in the month of August they draw out into the channel; perhaps they may go earlier, in the month of June.

56,628. Have those numbers you have given us been on the increase or decrease during the last 10 years?—I do not think they have varied much.

56,629. Is there always about the same number of Brixham boats coming here?—Formerly there were more, but the last eight or nine years there have been about the same number, and they have been generally the same persons.

56,630. And about the same number of boats belonging to this place?—No.

56,631. Have they increased?—Yes, considerably.

56,632. When did that considerable increase take place?—Within the last seven or eight years.

56,633. Are they increasing every year?—No, not every year.

56,634. Are there not some more put on every year?—No; I do not think there were more boats last year than there were the previous year.

56,635. Are the Brixham boats and the boats of Tenby much of the same class?—Some of the Brixham boats are larger, but we have now four or five vessels belonging to this place that are equal to the Brixham boats.

56,636. The new boats that are being built now are of a larger size?—There have not been any new boats built,—they were purchased.

56,637. Do you know what length of beam they carry?—No.

56,638. Then with regard to the line fishermen, can you tell us how many there are that go to line-fishing?—They vary considerably; they work the oyster dredge and the line-fishing together.

56,639. The same boats work both?—Yes; except that the smaller boats are more confined to long-line fishing.

56,640. How many boats are there of that smaller size that are open boats?—They are all open boats.

56,641. How many of them are there?—There may be 20 or 30 of the dredge boats.

56,642. Are they increasing in number?—Yes, they have increased. Recently there have been two or three built.

56,643. Then from your knowledge of the fishing here, do you know if the fishermen find it a profitable business and increasingly so?—From appearances I should say that they do.

56,644. Have you observed the oyster-fishing here?—Yes.

56,645. Do you agree with the previous witness that it is declining?—Yes.

56,646. Have you noticed when that decline commenced?—No, it has been gradual.

56,647. What do you suppose is the cause of that decline?—I have been told (but that is not within my own knowledge) that formerly they used to bring the oysters from Stackpool and put them down on Caldy Island. The beds were replenished in that way at one time, but not lately.

56,648. (*Mr. Lefevre.*) Was that from the Stackpool beds?—Yes.

56,649. (*Mr. Caird.*) They did that formerly?—Yes.

56,650. Do they not do that still?—No.

56,651. What is the reason that they do not continue that?—I do not know why they do not do it.

56,652. You cannot give us any reason, within your own knowledge, for the falling off of the oyster fishery?—No.

56,653. Is there any regulation enforced at all or understood among the fishermen as to the size below which they will not take oysters or bring them ashore?—I have repeatedly gone down, and, as Gifford said, there is no notice taken of them. I am very particular, and I have always been so in reference to the stoppage of the oyster season. On the last day of April they cease to fish. I do not say that they give me any trouble, because they do not. They do not commence to fish again until the 1st of September.

56,654. There is no attempt to fish during the close season?—I never saw any attempt for some years.

56,655. Is there any regulation enforced or understood among the fishermen as to the size of the fish they catch?—Yes; I believe it is generally understood that they are not to bring in small oysters.

56,656. Does anybody look after that?—I have myself gone down and remonstrated with them. I was not aware they did it.

56,657. Is there any standard size recognized among the fishermen, below which they are not to bring ashore oysters?—No.

56,658. No one does prevent them bringing ashore oysters of any size they like?—I would do so.

56,659. Have you ever done so?—Yes.

56,660. Have you prevented them from bringing in small sized oysters?—I have remonstrated with them, and told them to throw them on the beds. I have not done so lately.

56,661. Do they bring many small oysters ashore?—I do not think they do.

56,662. Do you think that the bringing of small oysters ashore has in any way injured the fishing?—It would decrease the number. If they were left they would grow larger; but I do not know that it has decreased the number.

56,663. Do you know if there has been an increase of spat or not?—No.

TENBY.

R. Parrott.

7 October 1864.

56,664. Is there a good breeding ground for oysters?—They are always recruiting themselves.

56,665. Has the number of oyster boats increased or diminished lately?—Increased.

56,666. The boats have increased?—Yes.

56,667. How are you aware that the quantity of oysters caught has diminished?—From what I have seen brought in. I used to see the boats bring 2,000 or 3,000, but now that is not so.

56,668. Does each boat get fewer now?—Yes, each boat gets fewer.

56,669. You do not know if as many oysters leave this place for the inland market as formerly?—They are not brought ashore, therefore they cannot be taken away.

56,670. (*Mr. Lefevre.*) Have you any instructions to look after the size of the mesh of the trawls?—Yes.

56,671. What are your instructions in reference to the mesh?—I have not got them with me, but I think the mesh is not to be less than $1\frac{3}{4}$ inches.

56,672. One and three-quarters from knot to knot?—I have the Act of Parliament; but I want to know what our instructions are to be. Some time ago there was a petition sent from Brixham, requesting that they might be allowed to wear out their old nets, and the reply was, that permission was to be granted.

56,673. Have you, from time to time, inspected the nets of the trawlers?—Not lately.

56,674. When you last inspected them, were they using meshes of a legal size?—The mesh was rather larger, but it was about that time that the petition went up from Brixham.

56,675. At that time they were using a mesh rather smaller than $1\frac{3}{4}$?—I think it was rather larger.

56,676. Rather larger?—Yes.

56,677. And do they still use a mesh rather larger than $1\frac{3}{4}$ from knot to knot?—I do not know. I have not measured them lately.

56,678. For the last few years you have not taken any pains to see what the mesh is?—Not lately, I have not.

56,679. What have you done with regard to the length of the beam or the weight of the head-irons?—There are only a few trawlers here. There are 13 now, but a few years ago there were not more than four or five. As they were Brixham trawlers, we took it for granted that their nets were proper when they came from Brixham, where the laws are strictly enforced, and that they could not on the passage make the mesh larger or smaller.

56,680. Do you take pains to see that the trawlers from this place use the legal mesh or not?—We have not done so lately.

56,681. Then you cannot say whether they do or not?—No.

56,682. What is done in reference to the length of the beam or the weight of the trawl-irons?—I was not aware that there was any restriction as to the length of the beam.

56,683. There is no such restriction observed here at all?—No.

56,684. Have you any instructions of a similar nature in regard to oysters, and the size of the dredge or the mesh of the dredge?—No, I think not. The only instruction I have, is to enforce the Convention between the French and English Governments, in 1856.

56,685. You have received instructions from the authorities of the Coastguard to carry out that Convention here?—Yes.

The witness withdrew.

C. Claxton.

Christopher Claxton called and examined.

56,686. (*Mr. Caird.*) Are you a trawl fisherman here?—Yes.

56,687. Have you been long a fisherman here?—Fifty-five years.

56,688. And you have always been a trawler?—Yes.

56,689. During all that time?—Yes, sometimes at Brixham, sometimes here. I have been here for 45 years.

56,690. Have you for the last 20 years been acquainted with the trawl-fishing off the coast of Tenby and South Wales?—Yes.

56,691. Have you observed whether there has been any increase in the number of vessels trawling along the coast within the last 10 years or so?—Yes, there have been a great many more vessels.

56,692. Has the size of the vessels increased as well?—Thirty years ago there was only one here.

56,693. Only one trawler?—Only one belonging to Tenby.

56,694. When you first began to fish as a trawler were the Brixham boats in the habit of coming here, or have they only come here more recently?—I used to come here myself.

56,695. Are you a Brixham man?—Yes.

56,696. When did you first come here?—In 1810 I came here first.

56,697. Have you been acquainted with the coast ever since?—Yes.

56,698. Is the quantity of fish caught here by the trawlers as plentiful or more plentiful than it was then?—It is much about the same thing in the proper season of the fishing.

56,699. Are there particular fishing grounds you are well acquainted with in the Bristol Channel, where you are pretty sure to find fish?—Yes, in the part of the Channel I am acquainted with.

56,700. Is the ground along the coast favourable for trawling generally?—It has failed lately for a few years. The only account I can give of that is that there are more vessels coming here. There is as much fish in the time of the year, but there are more vessels to take it up.

56,701. Have you ever trawled in Cardigan Bay?—No.

56,702. In St. Bride's Bay?—No.

56,703. Milford Haven?—No, only off here.

56,704. How far to the westward have you gone?—Off St. Govans,—to the westward of St. Govan's.

56,705. How far up the Channel do you go?—Up as far as the light-ship.

56,706. Just across Carmarthen Bay?—Yes.

56,707. How far south do you go?—Away three parts across to Lundy.

56,708. Do you trawl all the way between Lundy and Carmarthen Bay?—Yes.

56,709. Is that the best trawling ground?—It is only at a certain time of the year that we go there,—three or four months in the summer season.

56,710. What time of year do you trawl in the deepest water?—In July or June, and on that way.

56,711. (*Mr. Lefevre.*) Where are you fishing then?—Outside, in the deep water between Lundy and Caldy.

56,712. In the deepest water?—Yes, off St. Govan's—from that to Lundy is the deepest water. The further westward we go, the deeper water we find.

56,713. (*Mr. Caird.*) Are there 26 or 27 fathoms of water?—Yes, and I have found 30 fathoms between Lundy and Carmarthen.

56,714. Do you find the same description of fish that you used to catch upon the same ground?—There are just the same fish there now as there were 50 years ago.

56,715. There is no change in the kind of fish, and they do not seem to have diminished?—Not that I know of.

56,716. Do you get as many soles now as you were in the habit of getting formerly?—Yes, at times, but it is not very regular, as it used to be years ago. Sometimes we get a good haul, and at another time we hardly get anything.

TENBY.

C. Claxton.

7 October 1864.

56,717. Is there any particular ground that is favourable for soles?—No.

56,718. There is no well-known ground which is very good for soles?—No, it is just the same that it used to be.

56,719. Do you get many turbot?—Yes, sometimes.

56,720. Do you get as many now as ever you got?—Yes, and more sometimes.

56,721. Do you ever get any cod in the trawl?—Very rarely. We may catch one or two sometimes.

56,722. Do you get large quantities of gurnard?—Yes, there have been a great many gurnards this summer.

56,723. And flounders?—Yes, what we call plaice. We do not call them flounders. The flounder and the fluke are river fishes.

56,724. Do you get them nearer to the shore and in shallow waters?—Yes, and we get some in the bay in the time of year,—we catch what we call plaice.

56,725. Has the size of the trawl net you use been increased—is the mesh larger or has it become less in the course of the last few years?—Some have got smaller, and some larger. I have the mesh of my trawl as big as the proper size.

56,726. Is there anybody who looks after the size of the mesh that is used in the trawl-vessels, in order to ascertain if it is of the proper size?—No, there is no person here who does that.

56,727. Is there any rule among the trawl men here as to what the size should be?—No; one has one size, and another another.

56,728. Every one pleases himself?—Yes.

56,729. As a matter of rule among the trawlers, has the mesh gradually become smaller of late years?—Yes; in Brixham they have got them so small that you can hardly put your finger through. They catch mullet with them.

56,730. Is the mesh getting smaller here?—It is much about the same here.

56,731. Much about the same as at Brixham?—No, it is smaller at Brixham than here.

56,732. Are you not using a small mesh the same as they are using at Brixham?—We do not use as small a mesh here.

56,733. Do you not catch smaller than you used to catch?—No, we do not get as many small fish as we did 50 years ago.

56,734. You got more small fish then?—Yes.

56,735. Did you find a market for them, then?—We threw them overboard again. We took out the best and swept the rest overboard.

56,736. What do you do with them now?—Boys pick them up and take them away. They would not do us any good if they were brought ashore. We might just as well throw them overboard as bring them ashore.

56,737. Are all the small fish you catch brought ashore?—Not all.

56,738. All you can dispose of?—Yes. Sometimes they can sell them and sometimes they cannot.

56,739. Is there any large proportion at all of all you catch so small as to be unfit for sale or consumption in the market?—Yes, a good deal of them are unfit for the market when we have caught them.

56,740. Is there one-third of the whole catch, or what proportion may there be unfit for the market?—I cannot say what quantity.

56,741. How many baskets do you sometimes get with a good haul in one trawl?—Unfit for the market?

56,742. No, altogether, that you bring on deck with a good haul of the trawl?—Of small fish?

56,743. No, of all kinds?—Sometimes more and sometimes less. We have sometimes hardly any at all, and sometimes a very good catch.

56,744. What is a good catch?—Four, five, or six baskets.

56,745. Do you consider five or six baskets a good catch?—Yes, sometimes.

56,746. Did you never make a better catch than that in old times?—Yes, sometimes we caught a dozen baskets, sometimes only one, and sometimes four or five.

56,747. Suppose you catch six baskets, how many baskets out of those six will be so small as to be unfit for the market?—Sometimes they were all fit for the market, when we caught them outside, and sometimes in the bay there would be no small fish at all among them.

56,748. Sometimes they are not all fit for the market?—Yes; sometimes there is a good bit of small fish among them.

56,749. Would there be one or two basketfuls?—No, not half a basketful.

56,750. What do you do with them?—We pick them out; they are of no use.

56,751. There is no large proportion of all you catch destroyed in consequence of being of no use to anybody?—No. There are some that are of no use to anybody, but that we cannot help.

56,752–3. (*Mr. Lefevre.*) When you first came here, do you recollect what number of line fishermen there were?—I do not think there were any here at that time.

56,754. And there were no trawlers?—None belonging to this place. There were only one or two little boats. They used to go trawling then in the small boats in which they go codding and oystering now.

56,755. Then trawling was introduced by the Brixham boats?—Yes.

56,756. And the people here eventually took to it?—Yes.

56,757. Are the boats belonging to Tenby now manned by Brixham men or by Tenby men?—By Brixham men. A good many of the Tenby boats are manned by Brixham men.

56,758. They are manned chiefly by Brixham men?—Yes.

56,759. Then there is a kind of colony of Brixham men here?—Yes. There are several Brixham men who go in Tenby boats.

56,760. What is the size of the boats belonging to Tenby?—16 or 17 tons, and there are some big ones.

56,761. The smaller class are of 16 or 17 tons?—Yes.

56,762. And the other class will be of about 30 tons?—Yes.

56,763. Do you own a boat yourself?—No.

56,764. Are you master of a boat?—Yes.

56,765. What is the length of the beam you use?—38 feet, and some have the beam 40 feet.

56,766. What is the size of the boat you are master of?—About 17 tons.

56,767. Do the larger class of boats use a larger beam?—Yes, the bigger the boat, the larger the beam.

56,768. Is there any reason why they should be restricted to a beam of 38 feet in length?—Some use them 38 feet and some 40 feet. I do not think any of them use a beam of more than 40 feet. Not here at Tenby, but in Plymouth and Brixham, they use them of 42 feet in length.

56,769. Do you trawl much in winter between Caldy Island and Worms Head?—In the winter time we are all fishing in the bay.

56,770. Why are you fishing in the bay only in the winter time?—Because there are no fish outside.

56,771. It is not on account of the weather?—No; if we go outside of Tenby we find no fish at all; that is the reason we keep in the bay at that time of year.

56,772. Do you fish at all in the bays during the summer time?—No, not if the fish are outside, but in the first of the season, in March, April, and May, we fish in the bay.

56,773. But in June, July, and August, when the boats are lying in the harbour, they do not fish until they get outside?—No.

56,774. They do not let down their trawls?—No, not till they commence fishing outside. We do not

think much of fishing in the bays during those three months.

56,775. Have you ever yourself tried trawling in the bay during summer time?—Yes, I have tried several times.

56,776. What kind of fish did you catch in the bay then—did you catch a great number of small fish?—Yes, small fish, and some big fish too.

56,777. Was there a large proportion of small fish then?—No, much about the same as there is now.

56,778. What would be the effect upon the trawlers belonging to Tenby, if trawling were prohibited in the bays?—I cannot say, I am sure.

56,779. Would it cut off much of your fishing?—Yes, it would at this time of the year, but in the summer time, in the height of the summer, there would be no difference, because we do not go into the bays.

56,780. But would it injure your fishing in the winter time?—If we were not allowed to fish in the bay in the winter time, we might as well give it up altogether.

56,781. It would not prevent the Brixham trawlers from coming here trawling outside in the summer time?—No.

56,782. But it would stop the trawlers from trawling here themselves?—Yes.

56,783. Would it injure the Tenby boats?—Yes.

56,784. And not the Brixham boats?—No.

56,785. Would it cut off the winter fishing of the Tenby boats?—Yes, from this time until March again.

56,786. (*Mr. Caird.*) Do you ever foul any of the long-line fishermen's lines?—Yes, sometimes we have done so.

56,787. Do you and the long-line fishermen fish on the same ground?—We do mostly.

56,788. Do you interfere with each other much?—Sometimes we do in the bay.

56,789. Do they complain much of it?—No, they do not complain, because we do not get foul of them very often.

56,790. Do you carry away their lines? What do you do when you do get foul of them?—We clear them in the best way we can. It is by night that it is done. In the daytime, if they go in the way of the trawlers, it is their own fault.

56,791. Do you trawl both day and night?—Sometimes, but not at this time of year. We are generally in by night at this time of the year.

56,792. Do the long-line fishermen fish in the night time and in the day time?—Yes, their hooks are out night and day, and the trawlers come in the night, unless it is very fine weather.

56,793. Can the trawlers easily avoid the same ground that the long-line fishermen are fishing upon?—No, but the trawlers are not out. They are laid up almost all the winter, when the men begin to fish with long lines here.

56,794. (*Mr. Lefevre.*) Do not the trawlers fish at all in the winter time?—One may go out, but not many; they are generally in.

56,795. Is not the line-fishing principally in the winter here?—The trawlers are almost all laid up in the dead of the winter.

56,796. The trawlers are laid up?—Yes.

56,797. When are they generally laid up?—There are no fish caught, and they lay by for three or four months. There are no fish coming in; of late years they have been very scarce.

56,798. What months are you laid up?—From November and December; we laid up last year until January and February; when March and April came we were out again.

56,799. What did the men do in that time?—They did anything they could; they went in boats or anything.

56,800. Do they take to oyster dredging?—I do not myself, but most of the men in the vessels do.

The witness withdrew.

JOHN NOWALL called and examined.

56,801. (*Mr. Caird.*) Are you a Brixham or a Tenby man?—A Brixham man.

56,802. Have you long been in the habit of coming here fishing?—For 20 years.

56,803. Do you live here now?—Yes.

56,804. Have you heard the evidence which has been given by the previous witness?—Yes.

56,805. Do you generally agree with what he stated as to the supply of fish being quite as plentiful as it used to be?—The fishing here is according to the weather.

56,806. Have you noticed a large increase in the number of boats fishing on this ground during the last 20 years?—Yes, there are more boats than ever there were.

56,807. Have you never extended your fishing ground in that time?—No, we have always been fishing upon one piece of ground.

56,808. Do you ever go westward to Govan's Head?—No.

56,809. Nor into St. Bride's Bay, nor round into Cardigan Bay?—Not from here.

56,810. (*Mr. Lefevre.*) Do you never go eastward of the lighthouse?—No.

56,811. (*Mr. Caird.*) Then you just fish in Carmarthen Bay?—Yes, between Lundy Island and Caldy Island.

56,812. That is the ground you have fished upon for 20 years?—Yes.

56,813. And on that comparatively limited ground there has been a great increase of vessels fishing?—Yes.

56,814. Have you noticed any diminution in the number of fish?—No, there has been very little difference.

56,815. Have you found on going on the same range of ground now that you get the same fish you did?—Yes, just the same in the season.

56,816. Do you get as many soles as ever you got?—Yes, during the summer months, that is all.

56,817. Have you at all altered the size of the mesh of your net during that time?—No, we never do. We have a regular size, and two inches is the smallest mesh.

56,818. Has it been the same during the whole of your life as a fisherman?—Yes, as a regular rule that is the smallest mesh we have in the trawl net.

56,819. Is that commonly observed by the trawlers who fish in the bay?—Yes, it is mostly a guide for every one.

56,820. During what months of the year do you find the fish in Cardigan Bay?—About the last of May and the first of June; then they go inside, as the fish get scarcer.

56,821. Do you fish the whole year round?—No, there are no fish about Christmas. The boats are then all hauled up and there is nothing doing.

56,822. For how long?—We do not commence again until March or April. We commence the spring season on the first of April, but even then we get very little fish.

56,823. Are there very few fish to be caught here in the months of January, February, and March?—Yes, very little.

56,824. Do you not attempt to go further off the land?—No, it would be of no use. We have been off, but we have not found any fish. Some of the boats have gone out in the month of May, when the fish have not been plentiful in the bay, but they have got no fish.

56,825. Do the Brixham fishermen go out?—Here?

56,826. Yes.—No, not here, but they are always out there, both winter and summer.

56,827. Are there no fish found here in the winter?—No, not in the deep water.

TENBY.

J. Nowall.

7 October 1864.

56,828. Where do you find them ?—Between Caldy Island and Lundy Island, and from that to Worms Head.

56,829. Does the stormy weather affect your fishing? —Yes, a great deal.

56,830. In what way ?—If it blows a gale of wind from the south-west, in the first two or three days of the season, we can scarcely get any fish until the water becomes smooth again.

56,831. You do not find fish in stormy weather ?—Not at all times.

56,832. Is it in consequence of the bottom being at all moved or altered by the stormy weather that the fish change their position ?—It is supposed that it is from the strength of the tide and the ground sea. As soon as the weather becomes fine we get fish again.

56,833. You never go much outside the limits you mention ?—No, we do not like to go there and fish, the tide is too strong. We would rather fish on what we call the clear ground.

56,834. Has nobody offered to fish outside the limits ?—Nobody about here, off this coast.

56,835. Is there plenty of fish inside ?—It is not very plentiful, but we have to put up with it whether it is much or little. The fish are not plentiful, far from it.

56,836. Do none of the Brixham men ever fish in St. Bride's Bay ?—No.

56,837. Or Cardigan Bay ?—No, they never go from this coast. They come here for a few months in the summer time, and they all went away last week.

56,838. In what season do you get the smallest sized fish ?—In the spring we get small fish.

56,839. What distance from the land will it be ?—Eight miles, I suppose.

56,840. How close in do you ever come with your trawl-vessels ?—In the hake season we come in very handy to the land, but we do not take any small fish then.

56,841. Have you never observed any large quantity of small fish in your trawls ?—Sometimes a few baskets.

56,842. On the whole, do you catch a smaller class of fish there than you used to do,—do you catch more young fish ?—I do not see much difference in regard to that.

56,843. Have you ever destroyed the spawn of fish in the trawl nets ?—I do not think we have. We often see barnacle spawn and the like of that, but we never see the spawn of any fish.

56,844. Is there any herring spawn in the bay ?—No, we do not take any particular notice of any kind of spawn, but I do not think we destroy any spawn except barnacle spawn, which gets about the vessel at one time in the season.

56,845. Do you ever foul the lines of the long-line fishermen ?—Sometimes we come in contact, but not often.

56,846. Is there any complaint in that respect ?—They will make a bit of a bother at the time.

56,847. Do you both fish on the same ground ?—Sometimes, but not if they set their lines in deep water; we do not interfere with them then at all.

56,848. (*Mr. Lefevre.*) In the winter time you are fishing over the same ground that they are ?—It is in the winter season they commence codding.

56,849. Do you fish much at night during that season ?—Very little at night.

56,850. Would it be of any disadvantage if you were prohibited from fishing during the night time ?—I do not think there is any call for that, because we do not do it; there is very little of it done at this time of the year.

56,851. Do any boats come from other places to fish here—any trawlers ?—Not many.

56,852. Only from Brixham ?—There were two from Plymouth last year.

56,853. Are you the owner of the boat you fish in ?—No, the smack I belong to comes from Swansea.

56,854. Have many of the fishermen shares in the boats ?—Very few now.

56,855. The boats are owned by others ?—Yes, they are sailed under masters; very few have got any part in them.

56,856–8. Do they get a share of the take ?—Yes.

56,859. Have there been any new ones built for the last few years ?—No, none at all, they are all old vessels and they are now glad to dispose of them and get rid of what there are here. The fishing here is very trifling at present upon this coast.

56,860. (*Mr. Caird.*) The fishing now is very trifling ?—Yes; they would sell a great many of the vessels which are here now, if they could, as they do not pay.

56,861. (*Mr. Lefevre.*) Are they not paying the men ?—No.

56,862. (*Mr. Caird.*) You said some time ago that the fish were as plentiful as ever they were ?—That is owing to the weather.

56,863–4. The weather is the same as it used to be, is it not ?—No, the summer season is not the same as it used to be. This has been the finest summer we have had for many years.

56,865. (*Mr. Lefevre.*) Then it is not the scarcity of the fish, but the wind and other circumstances which have been against the fishing ?—The fish are not as plentiful, and they do not come about as they used to do.

56,866. Do you think that the ground may have been over-fished,—are there too many vessels fishing upon it ?—The more the ground is stirred up, the more fish there are. It is so on the Brixham coast.

56,867. Have you observed that here ?—No, it is not the same here. There are 150 smacks at Brixham, all over one bit of ground, and most of them get fish every day.

56,868. What then do you think is the cause of there not being so many fish ?—I cannot say, I am sure.

56,869. Do you fish much within the point in the bay, between Caldy Island and Worms Head ?—Yes, that is all the place we have to fish.

56,870. In the winter time ?—Yes, in the winter time.

56,871. Do you catch many small fish in that part ?—No, there are not many small fish to catch.

56,872. What would be the effect of preventing you from fishing within the headlands ?—I do not know what the effect would be.

56,873. Would it put a stop to trawling from this port ?—I cannot say anything about that.

56,874. Would it cut off a good deal of your fishing ?—I daresay it would.

56,875. Would it be profitable to own trawlers in Tenby, if that were the case, and if you were not allowed to fish within the bay ?—I do not know how that would be. Where could we fish besides ?

56,876. What would be the effect ?—I think you might as well stop our bread at once, if you take our bay from us; we might as well sell the vessels at once. That is the only bit of ground we have to go over on this coast.

The witness withdrew.

DAVID WILLIAMS called and examined.

56,877. (*Mr. Caird.*) Are you a fisherman here?—Yes.

56,878. Have you long been acquainted with the fishing in this bay?—Yes, for 20 years.

56,879. What kind of fishing do you follow?—The seine-fishing and oyster-fishing.

56,880. Will you describe to us how the seine-fishing is carried on?—When we see a shoal of mackerel, we shoot the net right round them and draw them towards the shore.

56,881. Have you good mackerel-fishing here?—Some years we have had it very good.

56,882. It varies very much?—Yes; this year there was nothing, and last year it was very poor, but the year before we had a good mackerel-fishing.

56,883. Do you fish herrings with the seine net?—Yes, sometimes.

56,884. Do you catch them in the bays?—Yes.

56,885. Do you get large quantities of them?—Sometimes.

56,886. Are they fished in the same way as pilchards are on the coast of Cornwall?—They are not nearly as plentiful.

56,887. But do you fish them the same way as the Cornish people fish pilchards?—No, not exactly the same. I think the net is a different kind of net.

56,888. Do any pilchards come here?—Very few.

56,889. What is the length of the seine?—About 70 fathoms.

56,890. And what is the depth?—Somewhere from 15 to 20 fathoms.

56,891. What is the size of the mesh?—It varies in size. It is very large at the ends, but when it comes towards the middle it gets smaller.

56,892. Is it very small then?—It is small enough to catch mackerel.

56,893. Will it catch anything smaller than mackerel?—It will catch herrings.

56,894. Will it catch anything smaller than herrings?—I have seen small things in the net when there has been a great body of fish.

56,895. Do you catch a considerable quantity of small fish in those nets?—The bait comes in with it.

56,896. Whitebait?—Yes.

56,897. Is the mesh small enough to catch whitebait?—Fish about the size of my thumb will go through.

56,898. But a good many small ones are caught with it?—Not many small ones.

56,899. Do you catch any so small that they cannot be used for food?—No; all of it would go through the net, except some whitebait, which come in when there are such a lot of mackerel. The sea is all white when we are drawing it ashore in consequence of the going out of those fish.

56,900. Is there any large quantity of fish destroyed, which cannot be used for food, by that mode of fishing?—Nothing at all.

56,901. Is there none left on the beach or thrown into the sea?—No, it will be all washed into the sea.

56,902. Are they all alive or dead?—All alive.

56,903. Is there any large quantity of fish caught with the seine nets here?—In years gone by there was a good many.

56,904. Are there many men employed in that way?—Yes, five men to each boat.

56,905. Are there many boats?—Seven or eight, I believe, altogether.

56,906. Are they increasing or diminishing?—There are more boats than there were five years back.

56,907. More now?—Yes, more now.

56,908. Is the fishing increasing, do you think?—I do not think there is much difference in regard to catching salmon or anything like that.

56,909. Do you get salmon in the seine nets?—Yes, sea salmon.

56,910. Do you get many?—Sometimes five or six, or more or less.

56,911. Do you fish with the seine net?—Yes.

56,912. Do you work it during the day?—Yes, always for mackerel.

56,913. And for every other kind of fish at night?—Yes.

56,914. Do you sometimes get large hauls of herrings with that net?—We may catch some years about 1,000.

56,915. Is that the largest haul you have ever had?—Yes, I think it is. I do not recollect more at a haul.

56,916. Are you a dredger of oysters?—Yes.

56,917. Can you tell us if the quantity of oysters here is diminishing or increasing?—There is nothing like the quantity there was here a few years back.

56,918. Are the beds far off the shore?—No, not very far.

56,919. Have you always been in the habit of fishing on the same beds for many years back?—Yes.

56,920. They are not dry at low water, are they?—No.

56,921. The oysters could not be lifted off the beds?—No.

56,922. Is there any regulation among the fishermen themselves as to the size of the oysters they take to the shore?—No, but it would be of no use to bring small things on shore,—they would be no good at all and we throw them overboard.

56,923. Do you cull them when they are fished and throw the small ones over?—When the dredge comes up, we throw the small ones overboard with the rubbish.

56,924. Is there a particular kind of oyster here which, although it is of the size that is sometimes taken for oysters that are suitable for the market, is really only the young of the oyster and has very little in it?—It would be of very little service to take oysters of that description.

56,925. Do you fish any of that size?—No, most of them are thrown overboard.

56,926. Is there anything in that oyster do you suppose?—Very little. It would be no good to carry it to the market.

56,927. Are there many oysters like that caught from your oyster beds and brought ashore?—Not many. There may be a few. All that is small we throw overboard. It is an oyster that is knocked off a big oyster. We should not have time to knock it off in the boat, and it is carried off to the shore fast to a big one. It is what we call a knocker.

56,928. What do you suppose is the reason that the oyster beds are not yielding as well as they used to do,—are they over-fished?—I cannot tell.

56,929. Are they fished out of season?—No, only during the season.

56,930. Are there more boats oyster-fishing than there used to be?—There are more, but they do not fish the beds half as long as they were fished formerly. We all want to catch good fish.

56,931. Do you say that the beds are not as long?—The beds are of the same length.

56,932. You do not fish for as long a season,—is that what you mean?—Yes, we fish now for about a month, perhaps, and then we go to catch codfish, and there will be very few boats then on the oyster beds until the cod-fishing is done,—that will be near January and then they go to the oyster beds again.

56,933. When did you notice the great diminution in the oysters?—They have been diminishing for a good many years.

56,934. (*Mr. Lefevre.*) Do you recollect the oysters being brought from Stackpole and being laid on the beds?—I have seen the boats in the habit of going down there cull the small ones and throw them out.

56,935. Has that ceased altogether?—There have not been many boats down there very lately, not worth speaking of.

56,936. Do they not catch oysters off Stackpole now?—I think they have gone scarcer.

56,937-8. Do they not lay down the small oysters

TENBY.

D. Williams.

7 October 1864.

they catch there?—They throw them on the oyster beds at once.

56,939. What is the size of those beds?—Perhaps a mile in length and more—there are different beds.

56,940. Are there any persons who throw oysters down there, and take them up again?—I do not know how it is with regard to that.

56,941. Have you laid down oysters there?—Yes.

56,942. Have you gone again and brought them away?—No, other men get them up. A great many boats come from Stackpole and throw their oysters there as well as us.

56,943. They would not lay them down there with the view of taking them up themselves?—No, the bed never dries.

56,944. Then it is below the level of low water?—Yes, it is in six fathoms of water.

56,945. Then anybody dredges there who likes?—Yes, anybody belonging to the town may dredge there.

56,946. Has the price of oysters increased of late?—No, I do not think it has.

56,947. Does it keep about the same?—Yes, just about the same.

56,948. Are there many oysters sent away from here to Bristol?—No, none.

56,949. Very few?—Yes, because there are very few to be got.

56,950. Then the supply is not much more than sufficient for Tenby itself?—Very little.

56,951. What number of men are there in an oyster boat?—Three in each boat.

56,952. Have they only one dredge?—Yes, one dredge.

56,953. What is the size of the mesh that you use in the dredge?—The mesh in the bag is very large, and the ring is $2\frac{3}{4}$ inches.

56,954. Then you will not catch many of those small oysters?—No, small oysters will get out through the rings.

56,955. Then unless the small oysters adhere to the larger ones, they would not be caught?—No, they go out.

56,956. Do all the fishermen use the same sized ring?—It is very likely the same sized mesh, but not the same sized dredge. A dredge must be according to the boat.

56,957. They only use one dredge, I suppose?—Only one.

56,958. Do you go line-fishing yourself?—I have been.

56,959. What is the season for codfish here?—It commences the last of this month.

56,960. And it goes on for how long?—Through November, December, January, and February.

56,961. Do you agree with the first witness, who told us that codfish has fallen off of late?—Yes, it has been falling off. I have not fished much in the bay; in fact, we cannot fish much in the bay.

56,962. Why?—Because there are so many trawlers carrying away our hooks, and of late years we have been obliged to go outside on the rocks.

56,963. Some years ago were you in the habit of fishing much in the bay?—Yes, it was all in the bay.

56,964. It was always in the bay?—Yes.

56,965. When did you find yourselves obliged to go outside on account of the trawlers?—Three or four years ago.

56,966. During those three or four years have you observed trawlers fishing more in the bay than they used to do?—Not a bit.

56,967. Why did you not go on fishing in the bay?—We often had a good deal of trouble; then we went outside and got better fish outside.

56,968. Did you fish by night as well as by day for cod?—Yes.

56,969. Have you found as many codfish outside as inside?—Yes, there are more outside, but we cannot get there unless it is fine weather. We can fish in the bay at all times, except it blows very hard.

56,970. You think that the codfish are plentiful, but you are not able to go out often to catch them?—We are not able to go out often to get them, but they have fallen off outside for the last two years as well.

56,971. You think that the supply of codfish outside has fallen off?—Yes.

56,972. Or is it that you have not been able to go out as often?—There are not as many.

56,973. And you are not able to go out as often as you used to do when you fished in the bay?—It is only when it is fine weather that we can go outside.

56,974. When you do go outside, do you catch as many fish as you used to do?—We have not done so for the last two seasons.

56,975. Have you ever observed what the codfish have inside them at that time of the year,—do they feed on the herrings, or what?—They feed on different sorts of things altogether, small fish, and other things.

56,976. You have never observed any herrings inside them?—No, not lately.

56,977. Do you know how many seines there are belonging to the place?—Five, six, or seven.

56,978. What is the value of a seine net?—It depends on the size—perhaps 20*l.*

56,979. Do they ever shoot the seine net out in deep water and bring it round in a circle without dragging it ashore?—No, the seines are not fit for that, they are too small and too shallow.

56,980. Do you look for the herrings before you set your seine net, or do you shoot it in the chance of catching fish?—We shoot it in the chance of catching fish.

56,981. Are the fish in good condition when you catch them, or are they at all injured by being rubbed together?—They are in very good condition.

56,982. Have you got any of the trammel nets?—No, there is not one in the town that I know of.

56,983. We were told that there were four boats that went out with nets for herrings that were not exactly drift nets, but were like the drift nets, only they were anchored?—Yes.

56,984–8. What ground do they fish upon?—They are regular herring nets, the same as those which are used everywhere else. They may drift them for two or three hours and then moor them.

56,989. What is the usual season for the herrings coming into the bay?—From October until about Christmas.

56,990. When the herrings are in the bay, do you find that you get as good a price for those caught in the seine nets as for those caught by the drift nets?—Yes, about the same, but we cannot catch them in the seine if there is rough weather, because we cannot land them.

56,991–2. Then you often catch them in the seine net the same night they are caught by the drift nets?—No, not very often. The drift nets are better when there is a little surf.

56,993. (*Mr. Caird.*) What kind of bait do you use for your lines?—What they call whelks.

56,994. Do you find them on the shores here?—Not on the shores but in the Roads.

56,995. Do you dredge for them?—We catch a lot in the dredge, and we have traps for taking them also.

56,996. Do you get plenty of that bait?—Yes, a good many.

56,997. You have no difficulty in getting bait to follow your line-fishing?—No, except there is frosty weather, or an easterly wind, or something like that.

56,998. Is there much of the ground off this coast that is rough ground, unsuitable for trawling?—Yes, at the back of Caldy Island there is.

56,999. Is it good for line-fishing?—Pretty fair, only it tears the lines generally on rough ground.

57,000. Do you fish on the rough ground much yourself?—Yes.

TENBY.

D. Williams.

7 October 1864.

57,001. Are the fish in as good condition there as on the smooth ground?—Yes, they are very good.

57,002. The trawlers cannot go on that ground at all, I suppose?—No.

57,003. Is there much extent of that ground?—There are different spots of it.

57,004. (*Mr. Lefevre.*) Have you suffered much from trawlers in the last few years, by losing lines?—Not in the last few years, because I have not been in the bay.

57,005. Are the trawlers all numbered?—I believe they are.

The witness withdrew.

George Cadwallader called and examined.

G. Cadwallader.

57,006. (*Mr. Caird.*) You are an oyster dredger?—Yes.

57,007. Do you follow any other kind of fishing?—Yes, cod-fishing.

57,008. With lines?—Yes.

57,009. Do you agree with the previous witness, that the oyster beds are not yielding as well as they used to do?—They are not yielding as well as they used to do.

57,010. Is there a great falling off in the supply of oysters?—Yes.

57,011. Do you catch many more of the small oysters than you did formerly?—The small ones are not as plentiful as they used to be.

57,012. They are not as plentiful?—No, not near as plentiful.

57,013. Do you catch a larger proportion of large ones than you used to do?—No, they are very scarce; it is not profitable to catch them now.

57,014. Not to catch any?—No.

57,015. Are there not many people employed in the oyster fishery here?—They had better do that than do nothing, but it does not pay wages, and it is hardly worth while to dredge for them; it is very poor property.

57,016. What is the cause of the fishing having fallen off?—I cannot tell.

57,017. They used to be very good?—Yes, at one time.

57,018. You used to get plenty of oysters?—Yes, it was very good.

57,019. Are there as many boats as there were then?—There are a few more boats now than there were then.

57,020. Do you think the oyster beds have been fished out, or have they been over-fished?—Formerly they used to put oysters on the beds, from Stackpole. Then the gentlemen of the town were accustomed to give us half a day's work in putting them down there in the spring of the year. If we could have encouragement like that to work on the beds, I think it would do good.

57,021. What did they give you?—They gave us a trifle for going down.

57,022. Could you not do it yourselves?—We could not afford.

57,023. It would be as well as doing nothing?—We have shrimps or something to catch.

57,024. Do you think the oyster beds would be much better, if you were to take again to the plan of lifting them from Stackpole and placing them on the oyster beds here?—Yes.

57,025. Will nobody do it?—We don't do it. If we could have encouragement to do it, I have no doubt we should take off to it. We are all poor men, and we cannot afford to give our labour for nothing.

57,026. Are there plenty of oysters to be found at Stackpole?—They are not as plentiful as they used to be, but there are a great many there.

57,027. Then if you were encouraged to go there, you would not get as many as you did formerly?—There are not as many as there used to be. We have not been able either last winter or the winter before to go there; the weather has been very rough, and it would not have been safe to have gone there.

57,028. I think you said that you were a line fisherman?—Yes.

57,029. Do you find that you catch as many fish by the line now as you used to do?—They are not as plentiful as they used to be.

57,030. What is the cause of that?—I cannot tell.

57,031. You said that you can get shrimps sometimes?—Yes, I can get a good many shrimps in the spring of the year.

57,032. Is this a good place for shrimping?—Yes, very good.

57,033. Do you shrimp with a net from a boat?—No, we walk along the sands and push the net before us, up to our knees in the water.

57,034. Do you ever try shrimping from the boat with a small trawl?—No.

57,035. That is not practised here?—No.

57,036. Did you get many small shrimps in that net?—Sometimes.

57,037. What do you do with them?—We put them away in the water.

57,038. They are not destroyed?—No.

57,039. (*Mr. Lefevre.*) Where do the oysters principally lie in the bay here?—Between here and Caldy Island, and outside St. Caffyn's Island.

57,040. Are there several beds of them?—Yes.

57,041. Were the oysters that were brought from Stackpole smaller than the oysters that were picked up here?—They are much like those we have here.

57,042. Are they about the same size?—They are not as good in flavour at Stackpole as they are here.

57,043. Are they not good enough for consumption in the market?—Not half as good as the Caldy oysters, but they come good afterwards.

57,044. They require being laid down on the beds here before they are fit for the market?—Yes, then they come a good deal better.

57,045. They improve on the beds here, and grow fit for the market?—Yes, the beds here are all sheltered by Caldy Island, and by St. Margaret's Island.

57,046. Is there any ground here that would answer for laying down oysters above low water for the purpose of fattening them?—No, that plan has been tried, but the oysters were knocked about by the surf and the ground sea that came in.

57,047. Was the sea too heavy for them?—Yes.

57,048. You are obliged to put them below the level of low water, in order to preserve them from the surf?—Yes.

57,049. When was it that the operation of putting down these oysters ceased,—how long ago?—Ten years ago.

57,050. Nobody has thought it worth while to do it since then?—No one has given us encouragement to do it since.

57,051. Did it give employment to a good many boats?—Yes, to all hands.

57,052. Are the beds at Stackpole very large?—Yes, there are several very good patches of oysters there. They are good large beds.

57,053. What was the matter with the oysters there,—were they green?—They looked watery and were of a darker looking kind than the Caldy oysters. The Caldy oyster is as white as possible.

57,054. Then they are not laid down on the beds here to fatten, but to improve in flavour?—Yes, and to fatten also.

57,055. Have you any complaint to make against the trawlers for trawling in the bay here?—Our lines are not safe here one hour together. It is not safe for us to go home even and get a bit of breakfast.

57,056. Do you agree with the last witness,—that you are obliged to fish further from the shore in con-

TENBY.

G. Cadwallader.

October 1864.

sequence of trawling in the bay?—Yes, we are bound to put our lines down somewhere.

57,057. You were formerly in the habit of fishing a great deal on the grounds in the bay, but are now obliged to go further out?—Yes.

57,058. Do you often lose your lines?—They have been torn all to pieces sometimes, and we have had a deal of bother with them.

57,059. Did you lose them?—Yes, by stress of weather they have been dragged away, and I have had them dragged away when there has been no stress of weather.

57,060. Did you ever lose your lines, when you knew that they had been carried away by the trawlers?—Yes, I have lost them several times, for three weeks at a time, and I have found them much injured.

57,061. How long ago was that?—Eight years ago.

57,062. At what time of the year?—In the month of November.

57,063. Was that in the night time?—Yes, they were hauled away in the night time.

57,064. Were you in the boat with the lines, or had you gone out and left them?—I had left them for the night.

57,065-6. You were not by to take the number of the trawler?— No, I was not there when they trawled them away.

57,067. Then it would have been possible for you, had you remained out with your lines, to have taken the number of the trawler?—Sometimes it blows very hard, and our boat being only a small one, we want to get in every night.

57,068. But if you had been out, would you not have taken the number of the trawler, and have got something for your lines?—I could have taken the number, if I had been there.

57,069. If you were able to fish in the bay, do you think you would catch more fish than you do outside?—I don't see why we should not.

57,070. Do you think it a hardship that you are not able to fish there?—We feel it a very hard case. Our boats are very small to go outside.

57,071. What would you suggest,—what do you think ought to be done to prevent this hardship?—They should give us a place to put our hooks in, and they would still have plenty of room to trawl in. They ought not to trawl away our lines. They could easily give us room, and we should give them room too. Trawling ought to be prevented within certain distances. The bay is big enough for them and for us too.

57,072. You think you could divide the bay between you?—Yes.

57,073. Is there not that division already? do they not take the bay, and you the rough ground, where they cannot trawl?—Sometimes the weather is too bad for us to go outside.

57,074. Do you agree with the trawlers who told us that they do not trawl much at night?—Yes, they do not trawl very often at night.

57,075. Do you shoot your lines often in the daytime?—Yes, night and day too.

57,076. Is there no rough ground in the bay?—Yes, outside, and off the Woolhouses.

57,077. How much of the bay is rough ground?—I cannot tell exactly.

57,078. What proportion of the bay is rough ground?—To the eastward of the Woolhouses.

57,079. About a half or a third?—No, about a mile or two.

57,080. Do you not set your lines there occasionally?—We do at times.

57,081. If you were to set your lines in the night time in the bay you would catch fish, and the trawlers would not interfere with you?—Sometimes the fish take the line better in the daytime.

57,082. But if you set your lines sometimes in the night the trawlers would not interfere with you?—Sometimes they are trawling night and day, and then we don't know where to put our lines.

57,083. You said just now that they trawled by night?—It is very uncertain; some do, and some do not.

The witness withdrew.

C. Creese.

CHRISTOPHER CREESE called and examined.

57,083*a*. (*Mr. Caird.*) Are you a dredger?—Yes.

57,084. Did you hear the evidence of the previous witness?—Yes.

57,085. Do you agree with him generally as to the oysters having become fewer than they formerly were?—Yes, quite so.

57,086. What is the cause of that?—I cannot give you any cause, except that the beds have not been mended as the last witness described.

57,087. How could they have mended them?—By adding to them.

57,088. By bringing other oysters from Stackpole?—Yes.

57,089. Why don't you bring them?—It is a very dead time of the year. We cannot get half a living by oyster dredging, and we are obliged to go and do what we can.

57,090. Would it not pay you sufficiently,—would it not afford you remuneration to do it?—No, unless it was improved very much.

57,091. (*Mr. Lefevre.*) Has there been much spat for the last two or three years?—No, I think not.

57,092. Has there been any at all?—There has been a little, but very little.

57,093. Only very little?—Yes.

57,094. When did you observe the last spat?—There has been a little at all times. We have found a little every season.

57,095. But there has not been a good one for four or five years?—I cannot speak of one time more than another. There has been nothing of consequence of late years.

57,096. Do you agree with the last witness as to trawling being a hardship to line fishermen on account of their not being able to set their lines in the bay?—I quite agree with his evidence. The rocks he mentioned are many miles off the land, and perhaps there may not be one day in a month when we can go there. There is a piece of ground close inshore, in Sandy Pool Bay, where we resort to and set our hooks, but we cannot be sure of them for one hour.

57,097. What kind of bottom is it—a sandy bottom?—There is a small piece of rough ground there, but there is not room upon it for four men to get a living, let alone 40.

57,098. Are there 40 line fishermen here?—Yes. There are two or three men in each boat. There are some vessels which make a practice of trawling all night and day too, and sometimes they stop out for two or three nights together. Nearly all the vessels were out last night.

57,099. When there has been a bad day they take advantage of a fine night to trawl?—Yes, and some vessels follow it all during the winter. They scarcely ever give it up. Some of them are laid up, but not all.

57,100. How many boats are there that fish with lines?—Twenty boats.

57,101. As many as 20 boats?—Yes, there are more sometimes, when some of the trawlers drop off and commence line-fishing.

57,102. Are most of the boats engaged as pleasure boats during the summer time?—Yes, nearly all of them, with few exceptions.

57,103. In the winter time do the trawl-boats occupy themselves in oyster dredging and line-fishing?

TENBY.

C. Creese.

7 October 1864.

—Yes, some of the trawlers lay their trawls up and go on the oyster beds.

57,104. Then you have two or three months, namely, December, January and February, when you can fish with the long-lines in the bay?—There are some two or three trawl-boats which follow trawling all the year round. They scarcely lay up one day when there is weather for them to go out.

The witness withdrew.

W. Smith.

William Smith called and examined.

57,105. (*Mr. Caird.*) What kind of fisherman are you?—I am a long-line fisherman—a cod fisher.

57,106. Have you anything to tell us which we have not heard already?—No.

57,107. Where do you follow the long-line fishing?—I go on the rough ground, out of the way of the trawlers.

57,108. Have you ever found many fish in the bay, on the smooth ground, for your lines?—Not since I have been going fishing, but others have caught a great many in the bay.

57,109. Where have you generally found the best fishing for your long-lines?—Outside on the rough ground.

57,110. That is best?—We get the best quality of fish there.

57,111. Is there some rough ground in the bay?—A little.

57,112. Do you fish it?—No.

57,113. Have you never fished it?—Some few times, but not often.

57,114. In what way do the trawl-vessels interfere with the long-line fishermen?—They drag them away.

57,115. They foul their lines?—Yes.

57,116. Is there any other harm that they do except that?—They could not do any harm, if they did not carry our lines away.

57,117. Can you catch as many fish outside now on the rough ground as you used to do?—No.

57,118. Are they getting scarcer?—They were a great deal scarcer last winter.

57,119. Was last year the first year that there was any scarcity?—No, the year before they begun to get scarcer.

57,120. What do you suppose is the cause of that?—I cannot account for it.

57,121. What kind of fish more than another have got scarcer?—Cod-fish.

57,122. Are the other fish you catch with the long-line also scarce?—We catch scarcely any other fish. We catch a haddock or two occasionally, but as a general rule we get nothing but cod. It is only a chance haddock that we get.

57,123. Do you get any conger?—Yes, we may have a few conger now and again, but nothing of any account. We also get a few dog-fish, two or three rays, and so on, just to make up the complement.

57,124. What bait do you use?—Whelks.

57,125. Do you find bait easily?—We have regular traps for them. We put a ray on a hook, and put a net on it and sink it down and the whelks go to it.

57,126. Do you find it a good bait?—Yes.

57,127. Have you ever used herrings for bait?—We never have a chance of getting any, except salt herrings.

57,128. Do not the herrings come here?—Not often—not often enough to get them for the hooks.

57,129. (*Mr. Lefevre.*) Were you in the habit of catching any large number of haddocks some years ago?—No. I never saw any great quantity caught by the hook.

57,130. It never was a fish you caught much with the long-lines?—No.

57,131. Is there a great extent of rough ground on which you can set your lines?—Yes, enough for all the boats.

57,132. Enough for all that are fishing over the ground?—Yes, enough for more boats than are here.

57,133. On that ground the trawlers cannot work at all?—No, they dare not show their faces there.

57,134. Do you think that they ought to be restricted also on some of the smooth ground as well?—There are some of the little boats that cannot go out, but I prefer going there, if I can.

57,135. You prefer the rough ground to fishing in the bay?—Yes, but there are other boats which are not able to risk going out there often. They could go and make a day's work in the bay, when they could not go out there and make a day's work.

57,136. They are quite a small class of boats?—Yes.

57,137. What number of boats are there?—There are some eight or nine or more. In fact, all the dredge boats are too small to go out there when it is rough weather.

57,138. When it is rough weather?—Yes.

57,139. When it is a little bit rough?—Yes. We were going out there last winter with the smacks when we had no business.

57,140. On the rough ground?—Yes.

57,141. How many smacks are there?—Only two.

57,142. Are trawl-boats ever used for long-line fishing in the winter time?—Not regularly. Sometimes one of the trawlers knocks off trawling, and agrees to go with our boats and take a hand-line. On the rough ground we have been talking about there are no codfish till the middle of December. We have tried repeatedly, and never found any.

The witness withdrew, and the inquiry was adjourned until the 8th of October, at Swansea.

Swansea, Glamorganshire, Saturday, 8th October 1864.

Present:

J. Caird, Esq., M.P. (Chairman). | G. Shaw Lefevre, Esq., M.P.

SWANSEA.

J. Bevan.

8 October 1864.

John Bevan called and examined.

57,143. (*Mr. Caird.*) You are a fisherman here, and have been for many years acquainted with the fishing at Swansea?—Yes, for 30 years.

57,144. What kind of fishing do you practise?—Oyster-fishing and trawl-fishing.

57,145. During the oyster season you practise oyster-fishing, and when that season is over you take to trawl-fishing?—Yes.

57,146. Can you tell us how many boats are engaged in the oyster-fishing here?—One hundred and forty-four.

57,147. Of what tonnage may the boats be on the average?—Eight tons.

57,148. Are they all decked boats?—Yes; they are all decked boats, or nearly so. There may be a few pulling boats, but I don't think there are many.

57,149. How many men are there in each boat?—Three.

57,150. Do you know whether the number of boats and men has increased or diminished within the last 10 years?—No, I don't think there has been much improvement during the last 10 years.

SWANSEA.

J. Bevan.

October 1864.

57,151. They keep much about the same in number?—Yes.

57,152. When you have had occasion to build new boats, do you build them about the same tonnage, or larger or smaller?—Just about the same tonnage.

57,153. You find that tonnage suitable for the work?—Yes.

57,154. Where are the oyster-beds situated on which you fish?—In this bay down as far as the Worms; about 13 miles in length.

57,155. You fish as far as Worms' Head?—Yes.

57,156. Do the oyster-banks extend over any considerable extent of ground off the Worms' Head?—They go as far as Lundy, and over to the other side of the channel.

57,157. Right across from Worms' Head to Lundy?—Yes.

57,158. Do you find oysters all the way across?—Yes.

57,159. Is there any other part of the Bristol Channel or Swansea Bay, in which you find them?—Yes, down in Caldy Roads. There are oysters below that, and down in Milford Haven there are plenty of them.

57,160. (*Mr. Lefevre.*) How far eastward up the channel?—Never further than Fairway, close to the entrance of the Neath River.

57,161. (*Mr. Caird.*) You never go eastward of that point?—No.

57,162. Are there no oysters found further up the Bristol Channel than the entrance to the Neath River?—Not on this side.

57,163. Do all the fishermen who come to Swansea fish over the extent of ground you have mentioned; namely, in Carmarthen Bay, Swansea Bay, and off Lundy Island?—At a chance time they go there to try.

57,164. There is a very large extent then of oyster-beds?—Yes.

57,165. Do you come on the same ground as the Tenby fishermen?—Yes.

57,166. Do you never fish where they fish in their bay?—No, we only trawl there in the summer time.

57,167. Have you found any part of the oyster-beds less productive than they used to be of oysters?—No, rather more so. There are so many boats that they tear the ground up.

57,168. Do you think that that improves the fishing?—Yes, it does. This year there are oysters where there were never oysters before.

57,169. Is there as good a fishing this year as you ever knew of?—Yes, just as good.

57,170. Do you take any large quantity of small oysters?—No, none. We only take them of a proper size. There would be no one to buy them, if we did not.

57,171. There would be no sale for them?—No, not here.

57,172. Have you any gauge by which you fix the size of the oysters you bring to the market?—No; but we know the size, which is $2\frac{1}{2}$ inches in diameter. We take them up in our hands, and if they are not that size, we throw them out.

57,173. Is there any regulation with regard to the size of the mesh of your dredge?—No.

57,174–6. Nobody interferes with you in any shape whatever?—Not at all.

57,177. What is the size of the ring?—About three inches.

57,178. Is that the smallest size?—Yes, that is the smallest. They are all of the same size; they are made by a gauge.

57,179. For all the fishermen?—Yes.

57,180. You never have a smaller size than that?—No.

57,181. That is a regulation you have among yourselves?—Yes, that is the regulation.

57,182. Has that long been a regulation among yourselves?—The men who make them, make them all by gauge. They are all of the same length.

57,183. Is the size of the mouth of your dredge pretty uniform among you all?—Yes, it is just the same.

57,184. What is the width of the mouth of the dredge?—Four inches or four and a quarter.

57,185. That is the mouth?—Yes.

57,186. What is the length?—Three and a half feet.

57,187. That is the regular thing among the whole of the fishermen?—There are smaller boats which do not have them quite as large.

57,188. Do you use one dredge or two in a boat?—Two.

57,189. Do you always work with two dredges, or one up and the other down?—We work with two.

57,190. Is there any regulation as to the season in which you fish for oysters?—Yes.

57,191. Does anybody enforce it, or do you attend to it yourselves?—The cutter comes round, and the Coastguard.

57,192. The Coastguard will not permit you to fish during the close-months?—We are not allowed to carry the gear in our boat. She is seizable if we have a dredge in her.

57,193. Is that strictly looked to?—Yes, they come and overhaul us. If there are boats coming down after the close-season is over, they come and see whether we have any fishing gear; and if anything of that sort is found, they take it away and stop the boat directly.

57,194. In what months of the year do you find the oysters in the best condition?—In the first of the season, that is, about now.

57,195. Does the season begin in September?—Yes.

57,196. Are the oysters in as good condition in September as they are in October and November?—Yes.

57,197. Do they continue in as good condition throughout the whole of the season?—Yes.

57,198. Are they in good condition in the month of April?—Yes.

57,199. There is no desire on the part of the oyster fishermen to extend the season, or alter it?—Yes, they desire to lengthen it.

57,200. How do they want to do that?—They want to dredge in the month of May, and stop in the month of September.

57,201. To begin in October and finish in June?—Yes.

57,202. Is that a general wish among the fishermen?—Yes, among some parties.

57,203. What do you think of it?—I think the season should remain as it is.

57,204. Is that the general opinion of the oyster fishermen?—It is my opinion. I think the oysters ought to rest sometimes, and those four months are when they spawn.

57,205. When do they spawn?—During the four months in which we do not catch them. We catch them sometimes in the trawl in the night-time, and if we open them we find them full of spawn.

57,206. Then you think that the months which form the present close-time are the most suitable for the brood of fish?—Exactly.

57,207. You do not desire any change?—No.

57,208. Have you had a good spawning season lately?—We fall in with the young spawn now and again.

57,209. But has there been a good oyster spawning during the last few years?—Yes; the oysters are quite as good as they have been for the last 10 or 12 years.

57,210. There has been a good spat?—We call it spawn.

57,211. Have you not observed that there are sometimes seasons in which the spawn is not very favourable?—Yes.

57,212. There is a considerable difference in the seasons as to spawning?—Yes, a good deal. This has been a fine summer; the finest summer I have known.

57,213. Then you expect a large fishing this season?—Yes; there are oysters everywhere, go where you will.

57,214. The price of oysters has increased, has it not?—Yes. There has been more traffic since the railways came, and since the steamers have been taking them away.

57,215. Are the oyster fishermen making a good trade of it now?—They are making a living out of it.

57,216. With the increase of price, and the oyster-beds continuing to be productive, are you not improved in your circumstances?—No, there is very little of that.

57,217. You say that during the close-season you go trawling?—Yes.

57,218. With the same vessel that you fish for oysters?—Yes.

57,219. What is the size of the trawl that you use?—Thirty-one feet.

57,220. What is the smallest size of mesh?—One and a quarter inches.

57,221. (*Mr. Lefevre.*) Is that from knot to knot?—Yes, it is from knot to knot.

57,222. (*Mr. Caird.*) Where do you trawl?—Perhaps I should say that the bag of the net is three inches where the small fish go through.

57,223. Where do you trawl?—At the higher end of this bay, down Carmarthen Bay, off the Worms' Head, and down to Caldy Island.

57,224. That is very much over the same ground that you dredge upon?—No; we don't trawl there. It would cut our net all to pieces.

57,225. You must keep on the soft bottom?—Yes, on a sandy bottom for trawling.

57,226. Do you find that your trawl-fishing now, is as successful as it was in former years?—No, sometimes we may fall in with a shoal of fish, and sometimes not.

57,227. Is there any particular kind of fish that has fallen off more than another?—I think they have fallen off about this part. There used to be plenty in the season, and now we hardly see one.

57,228. What fish do you refer to?—Salmon and sewin.

57,229. What is sewin?—White trout, sea trout. They go down the same as the salmon to the salt water.

57,230. Did you formerly get many of them?—Yes.

57,231. In what way did you catch them?—With a seine-net.

57,232. Do many fishermen use the seine-net here now?—Yes, a good many gentlemen use them in the summer time with yachts.

57,233. Do they fish from the shore or with boats?—From boats, they pull them round.

57,234. They make a circle?—Yes; they pull them round.

57,235. You say that the trawl-fishing on the whole has decreased?—Yes.

57,236. Is there any cause you can assign for that?—Yes.

57,237. What is it?—I think they injure them and kill them in the summer time with weirs. I am sure of it. I have seen hundreds and thousands of them destroyed.

57,238. Is this (*pointing to a model*) the sort of thing you call a weir?—Yes; I have seen lots of small fish go in there, and then be found dead.

57,239. Are the fish all dead when taken out?—No, not when they are taken out; but all that are left, because they are not big enough to take away, perish.

57,240. Have you seen those weirs fished?—Yes, scores of times.

57,241. Do they get many fish?—Sometimes they do.

57,242. What kind of fish do they catch?—Soles, sewin, mackerel, and different sorts in the season.

57,243. Do they kill many fish with those weirs?—Yes, thousands of them.

57,244. Of good marketable fish?—No, only young fish.

57,245. Do they not kill good marketable fish?—Sometimes they do.

57,246. Is there any large proportion of the fish caught here, caught by that description of weir?—Sometimes there is, but they kill the spawn before it becomes marketable.

57,247. Are these weirs in use the whole year round?—Yes, every day in the year.

57,248. Do they get any salmon in them?—Yes, and sometimes sturgeon. I have seen sturgeon caught in the weirs.

57,249. What kinds of small fish have you seen caught in them?—Soles, and all kinds of flat and round fish.

57,250. Small young fish?—Yes.

57,251. Have you repeatedly noticed whether there were any large quantities of those young fish caught that were useful for food, and allowed to waste?—Yes, thousands of them. I have seen them on the sands. They put down the net in the water, and bring them up, and what is saleable they take away, and the rest they leave behind.

57,252. They throw it aside?—Yes.

57,253. Is there a large quantity of that description of fish thrown aside?—Yes, thousands of them.

57,254. That mode of fishing has been a long time in existence?—Yes.

57,255. As long as you can recollect?—Yes.

57,256. When did the diminution in the fish begin to take place in the time you refer to?—Ten or 12 years ago.

57,257. Do you think these weirs have had any effect upon the general fishing?—It is the weirs that have destroyed the fishing.

57,258. They have been in existence long before 10 years ago?—Yes, as long as I remember.

57,259. How long is that?—Thirty years ago.

57,259*a*. Was there any complaint about this mode of fishing before 10 years ago?—I have heard complaints all along at different times.

57,260. (*Mr. Lefevre.*) How many boats are employed in trawling in the summer time?—There may be a dozen.

57,261. I mean of the oyster-boats?—Not more than a dozen.

57,262. What do the others do?—They are laid up.

57,263. You say that you recollect the fishing here 30 years ago?—Yes.

57,264. Do you recollect what number of oyster-boats there were then?—I should say that there were as many then as there are now.

57,265. Were the same number employed in trawling then, as during the close-time?—There were more then. They worked by the hand, and there were four men in each boat.

57,266. That was in the oyster-dredging?—Yes.

57,267. But were the same number of boats employed then in trawling during the close-time?—There were none employed in trawling then.

57,268. When did they begin to trawl?—They began trawling about May.

57,269. But how long ago did they begin trawling?—Ten or 12 years ago the small ones; but there were large ones here then.

57,270. The large ones came from Brixham?—Yes, and Plymouth too.

57,271. There were no large boats belonging to Swansea?—Yes, two or three.

57,272. Did they fish off Carmarthen Bay?—Yes.

57,273–4. Is there any cause you can assign for the falling off in the supply of fish?—Perhaps the quantity of ore that comes down the water may have some effect in destroying the fish. The water is quite tainted with ore.

57,275. Do you think that has had any effect in the bay?—It has not affected the oysters.

57,276. But has it affected the soles and other fish?—I cannot say about the fish; but it has not affected the oysters.

SWANSEA.

J. Bevan.

8 October 1864.

57,277. I thought you said that the falling off in the trawl-fish might be owing to that?—It is either that or the weirs.

57,278. It has affected the salmon and the sewin?—Yes, the spawn has been killed, and we cannot expect to have the fish after that.

57,279. Do you find that the oysters in the bay are coloured by the copper ore; are they at all green?—No, not one of them.

57,280. Are all the oysters caught here brought into Swansea, or sold on the quay?—No, not one fourth of them.

57,281. Where are the rest sent to?—There are 70 or 80 boats down at Mumbles.

57,282. Did you include those 70 or 80 boats in the 140 you gave us?—Yes; and there are also boats at Portatyn, which are included in the 140.

57,283. Do they bring their fish in at Mumbles?—Yes, and send them away by rail.

57,284. Do they send them up from here to Bristol and other places?—Yes.

57,285. Are there any oyster grounds here for the purpose of laying down oysters?—Yes.

57,286. Are there many such beds about here?—Yes, there are men who have beds of their own at Mumbles.

57,287. Are there any men in Swansea who have beds upon which to lay oysters down?—No.

57,288. Is there any demand for small oysters for that purpose?—No.

57,289. Will the merchants here not buy small oysters?—No.

57,290. What is the smallest size they will buy?—Two and a half or three inches in diameter.

57,291. Do you take up in your dredge a great number of small oysters?—Sometimes when we fall in with them; but if they are not saleable we put them overboard again.

57,292. Do you not find it worth while to bring them in, because you cannot get any market for them?—Yes, we have no sale for them.

57,293. Do you find any difference in the size of the oysters if you go into deeper water?—Yes, they are a good deal larger.

57,294. Is there much ground in the middle of the channel which you are unable to fish, on account of the bad weather in the winter?—Yes, we could not go down the channel with the trawl, and the wind against us.

57,295. Are you able to fish that ground better as the season advances, say in March and April?—Yes.

57,296. Suppose the open-time were extended, would you fish the ground more than you are able to do now?—Yes.

57,297. Do you at all recollect the fishing here before the close-time was enforced?—Yes; I have been scores of times at it.

57,298. Did you dredge then during the whole of the year?—Yes.

57,299. Did you fish the same grounds then as now?—Yes.

57,300. Did you fish further out in the channel than you are able to do now, on account of the weather?—Yes.

57,301. When was the close-time first enforced here?—About 11 or 12 years ago.

57,302. Previous to that did you observe any decrease in the quantity of oysters in consequence of fishing all the year round?—No, not any. If there was fine weather, there were as many oysters as ever there were.

57,303. Did you get a good price for the oysters in the summer time during the close-season?—No, we did not get as much for them.

57,304. Did you take up a great number during the summer time?—Yes, we caught more than we could ever sell.

57,305. Since the close-time was enforced, I think you said the number of boats has not increased?—No.

57,306. Nor the take of oysters?—No, I don't think there are more boats here. There are 144 here, and at Mumbles, Portatyn, and Tyguin.

57,307. Previous to enforcing the close-time, was the number of boats gradually increasing from year to year or not?—They did at one time increase, a few; but I do not think they are increasing now.

57,308. But previous to the enforcement of the close-time, did they go on increasing or not?—Yes, they were increasing before they were stopped.

57,309. But they have not increased since the close-time has been enforced?—No; there may be half a dozen, or seven or eight, or thereabouts.

57,310. When they were allowed to fish in what is now the close-time, did they chiefly go into deeper water in the summer time?—Yes, they went into deeper water in the summer time than they do now.

57,311. I think you said that tearing the ground did good, in clearing and cleansing it?—Yes; the boats tear the ground, and throw the spawn in all directions. There are oysters now where there were none eight or ten years ago. There are the spawn of oysters all over the bay now to a much greater extent than was the case formerly.

57,312. Then you think you make a better fishing than you did 10 or 12 years ago?—We make as good a fishing if not a better.

57,313. Is there much variety in the oysters you find in different parts of the bay?—There are some of them better than others.

57,314. Is there much difference in the colour?—Yes, there is a difference in the colour.

57,315. Do you find any green oysters in any part of the bay?—No, not one.

57,316. What is the difference in the colour?—Some are reddish, and some are white.

57,317. Is there a good deal of smooth ground mixed up with the oyster-beds over which you can trawl during the close-time?—No, we cannot trawl on the same grounds that we dredge.

57,318. Then you have to go outside the line from Worms Head to Lundy Island before you can trawl?—Yes, that is all clear ground, with a sandy bottom.

57,319. Do you go outside that line?—I go right round the bay, off Carmarthen Bay altogether.

57,320. Across Carmarthen Bay?—Yes, right across.

57,321. Do you ever trawl eastward of the bay, up the Bristol channel?—Yes.

57,322. What do you catch there?—Soles, hake, turbot, gurnard, and different fish.

57,323. Do the herrings ever come into the bay here?—Sometimes, but not often.

57,324. When is the last time you recollect the herrings in the bay?—Five or six years ago.

57,325. Are the boats provided with herring-nets here?—Yes.

57,326. With drift-nets?—They catch them in the weirs sometimes.

57,327. But are the boats provided with drift-nets?—No, nothing of the sort.

57,328. Are they only provided with seine-nets?—They put them on poles on the sands.

57,329. A kind of trammel-net?—Yes, or stake-net.

The witness withdrew.

G. Harry.

GEORGE HARRY called and examined.

57,330. (*Mr. Caird.*) Do you hold an office connected with the corporation of Swansea?—Yes, I am deputy town clerk of the borough. I gave some evidence on the occasion of the visit of the Salmon Fishery Commission, and that evidence I wish to repeat before this commission, as it applies more particularly to the inquiry which you are making.

57,331. It applies to the sea fishery?—Yes.

57,332. You are about to give us evidence with regard to the fishing weirs?—Yes, and the stake-nets on the coast.

57,333. Have you had your attention called to a mode of fishing carried on in the bay of Swansea by weirs?—Yes, I have frequently.

57,334. And you have already given evidence before a Royal Commission in reference to those weirs?—Yes.

57,335. You desire to repeat that evidence now?—Yes, I was asked if I concurred in the evidence given by Mr. Matthew Moggeridge, and I said I did. This is the evidence:

"Are there any fixed engines for fishing upon the estuary?—Nearly the whole sweep of the bay is covered with weirs ending in traps.

"What are these engines that you call 'weirs' constructed of?—Wicker-work; they are brought to an apex, so that nothing once in them can escape.

"Are there any of these wicker weirs across the mouth of the river?—No; they would be in the way of the navigation.

"What fish do these weirs take?—Salmon and sewin are the only river-going fish that they take. What I complain of is, that their destruction is such that they not only take big fish, but destroy an immense number of very small fish. You will see soles and turbot, and all sorts of fish, not longer than a few inches, destroyed in thousands, I might almost say millions.

"Are there any other fixed engines in the estuary?—There are stake-nets, and the same objection applies to them. Great quantities of young turbot, soles, and flat-fish, that are quite worthless for the market, are destroyed by the stake-nets.

"Are there a great many stake-nets?—They are not so extensive as the weirs."

I was then asked:

"Do you know what are called stake-nets upon the coast?—Yes. I reside on the margin of Swansea Bay, and I can speak particularly of the fishing-engines that are erected there, and of the things you have heard called weirs."

57,336. You draw a distinction between weirs and stake-nets?—Yes.

57,337. Are there stake-nets also in the bay?—Yes; I was then asked:

"Are these weirs made of wicker-work?—Yes; they come to an apex, and at the apex they have a basket; that basket generally contains a large quantity of water at low tides, so that the fishermen are obliged to take the fish out with a small round net, and with that net they take pretty nearly all the fish that are in the basket. I have myself upon numerous occasions seen fish of a pitiful size taken out; small turbot, brill, soles, and other fish.

"Have you ever seen salmon peal in those baskets?—I have seen them; but not frequently.

"What is the size of one of those baskets?—In most cases the baskets are, I should say, about six or eight feet long by four or five in diameter.

"What prevents the fish from getting out?—The wicker-work; the water runs out of the basket through the interstices in the wicker-work. There is also, in many cases, a small door at the extreme end with holes in it, for the purpose of cleaning the basket out, and for the purpose of fishing the basket; there is a trap-door on the top of the basket, which is generally kept locked. The stake-nets to which you referred, are used more particularly in this bay for the herring fishery; these nets have a small neck, and I am not aware that they are used to take any other fish than herrings.

"Is there any trap to them?—No; nothing whatever. There is a series of upright poles stuck in the ground, and the nets hang between each pole something like a draft-net.

"Do very small sewin get into the stake-nets sometimes?—I have never seen them.

"Do the fish mesh in the stake-nets?—They do. There are two other descriptions of fishing in this bay practised by labourers on the coast, as well as fishermen; that is, by a draft-net or draw-net, and angling.

"Are salmon or sewin taken with the draw-net?—They are.

"Is that net much used?—Yes; within five or six miles of Swansea, and I think, as low as Oxwich. In fact, nearly all the bays on the southern side of the peninsula of Gower are fished in that way.

"Are the fish taken in any quantity?—I have seen great quantities of fish taken. There are phases in fishing; sometimes they are very successful, and at other times they are not successful. It depends very much upon the state of the water, and the bright appearance of the night."

57,338. That is seine-fishing of which you speak now?—Yes, draw-nets.

57,339. Have you any further information to give us with regard to this particular instrument, the weir?—I had no other desire than a wish to draw the attention of the commissioners to the plan now before them, which shows the numerous engines fixed in that form in this bay.

57,340. What is the object of that part of the fence which is loaded with stones on the outside on each side?—That is for the purpose of defending the weir itself from the action of the sea.

57,341. It has no object with regard to the fish itself?—No; it is only to strengthen and form a good foundation for the weir.

57,342. Are these weirs set close together all along the bay where they are set?—Yes, in continuation of each other.

57,343. Does the second weir come close to the first?—Yes.

57,344. And there is a series of weirs all along?—Yes.

57,345. Without intervening openings?—In some cases there are openings.

57,346. (*Mr. Lefevre.*) Are they set for a distance of five miles along the bay?—Not the whole distance. I should say that for something like a couple of miles or more they are continuous.

57,347. (*Mr. Caird.*) Are they in a single line?—Yes.

57,348. There are no double lines; that is to say, there is not one row in one place, and another inside?—No, except in cases where I have observed that weirs of an ancient date have become dilapidated, and instead of repairing that identical weir, a new one has been set up a short distance from the former one, generally further out at sea.

57,349. Is it a muddy bay?—Yes, rather.

57,350. And there is a strong tide running in it?—Yes.

57,351. Is it not the case that such weirs have a tendency to silt up?—No; I think the weirs do not, although silt is gradually settling in our bay. Since the opening of the harbour took place, there has been a habit of putting in ballast, and the debris from the public works.

57,352. Has it floated away and been collected there?—It has not collected generally, but it settles there in that part of the bay.

57,353. These weirs have been in existence from time immemorial?—Yes.

57,354. Have they increased in number of late years?—I think they have.

57,355. Have they been set closer?—No, the same relative distance is maintained; but additional ones have been erected.

57,356. Lengthening the lines?—Yes.

57,357. Have they continued to make them of the same form as hitherto; have they been very closely wattled?—Yes; but the form of the present modern weir has been changed from that of the ancient weir. The ancient weir had at its apex a lane or neck. They are now constructed more particularly in the form of the model.

57,358. This is found, I suppose, to be a better killing net?—No doubt it is a more killing one.

57,359. Does this part of the basket work (*pointing to the model*) run outwards to the sea?—Yes, it does.

57,360. And the fish come inside?—Yes.

57,361. Are they caught chiefly in the flow or ebb of the tide?—In the flow generally. They flow up with the tide, and they are caught with the ebb.

57,362. Then they must come in at one end of the long line of weirs?—They flow over.

57,363. And they are caught as the tide goes down?—Yes.

57,364. Everything that happens to come in with the tide is sure to be caught in fact?—Yes; every small fish that gets within the line of weirs must be caught, as there is no means of escape.

SWANSEA.

G. Harry.

8 October 1864.

57,365 Do you know what height the weir is above the basket?—About five or six feet.

57,366. At the highest point it is about five or six feet high?—Yes.

57,367. What height does the tide flow, or what depth of water is there over the top of the net at high water?—The chart, I think, will show that. You may take it from 18 to 20 feet.

57,368. That will be a depth of about 12 feet over the net?—Yes, that will be somewhere about the average.

57,369. Have you any idea as to what number of those weirs there may be all along the shore?—I can give it to you from the chart. I think there are 13 altogether; but some of them are old ones.

57,370. Still they are in existence?—Yes, but they are not in complete repair. There are 13 or 14 of them, I think, altogether.

57,371. These nets stand on the sand, and are fishing the whole year round?—They are.

57,372. And at no time, either Sunday or any other day, are they left open, so that the fish may have an opportunity of escaping?—No, they are not.

57,373. From year end to year end they are fishing perpetually?—Yes.

57,374. And everything that goes inside of them stands a chance of being caught?—Yes, and I find they are particularly destructive of the fry of soles, flounders, brill, and turbot.

57,375. You have observed that, I presume, from having noticed the basket when it was being emptied?—Yes.

57,376. What quantity have you seen of the fry of different kinds of fish, in proportion to the whole catch of fish?—I can scarcely tell you that, for this reason; at some tides they catch a quantity of this fry, while at other times, little or none is caught. I can scarcely, therefore, give you the relative proportion of the fry to the large fish caught.

57,377. Are you aware whether there is any large quantity of fish caught by these nets, which are unfit for consumption, and are not sent to the market at all?—Yes, the fry are too small for that purpose.

57,378. Do you know whether the supply of fish from these nets to the market is considerable?—No, it is not very considerable.

57,379. All that is got of a marketable character is not considerable?—It is not considerable, in my opinion.

53,380. Is the destruction that they do, of much greater importance than the supply they give to the market?—Undoubtedly.

57,381. Has it been a matter of complaint on the part of the fishermen, and those interested in the fisheries, that a great destruction of fry takes place by the use of these nets?—I have frequently heard such a complaint made.

57,382. From your own experience do you agree with it?—I think it is well founded. The inner portion of the weir has a quantity of standing water in it all the year round, and that is fished by shrimp-nets, and nets of a similar description. They take out from that part the fish that are caught, but are not in the basket.

57,383. Is this mode of fishing practised on any other part of the coast of England?—I do not know; but I think it is practised on some parts of the coast of Carmarthenshire.

57,384. (*Mr. Lefevre.*) Westward of the Mumbles Point?—No, I believe not.

57,385. Eastward of this bay are there any?—There are one or two, I believe; but very few. They principally congregate in this bay.

57,386. Have you ever observed at any time of the year more of the young fry of fish in these weirs than at any other time?—No, except in the spring and summer months. I have observed them at that time. I should say that I am not a frequent visitor to the weirs. I merely go down alone from curiosity. I do not make it a monthly or a weekly practice. My visits there have simply been made from curiosity, and a desire to obtain information.

57,387. You cannot say whether the take in the weirs has been falling off or increasing of late years?—I have heard the fishermen complain of a falling off.

57,388. The fishermen to whom these weirs belong?—Yes.

57,389. Do you think that the increase of works on the river and the discoloration of the water has had any effect upon the fishing in the bay?—Well, I have no doubt that that has had an effect upon the bay fishing.

57,390. And also the silting up of the bay which you have described to us, may affect it?—No, I do not think that has had any effect upon the fishery.

57,391. As the weirs have silted up, have they been erected further out in the bay?—No; they are pretty much in the same place, within a few yards. When I refer to the silting up of the bay, I ought to say that it is scarcely appreciable in many cases, and that there is only a thin layer on the general run of the bay.

57,392. Is it altering the character of the bottom of the bay?—Yes.

57,393. Not so much silting up the bay as altering the character of the bottom?—Yes.

57,394. What is it becoming now?—It is becoming of a sandy character now from a muddy one.

57,395. Do you think that might have any effect on the fish in the bay?—No, I do not think so.

57,396. You state that inside these weirs a great deal of shrimping is carried on?—Shrimps and prawns are caught there, I believe.

57,397. Is that by the hand-trawl?—Yes, by the hand-net.

57,398. Have you observed whether many young fish are caught in that way?—No, I have not; but I do not think there are. I do not think that any young fish are destroyed by that kind of fishing.

57,399. Is there any mode in which these weirs could be used without destroying young fish?—No, I think not.

57,400. I think you said that there were stake-nets for herring besides these weirs?—Yes.

57,401. Will you describe what those nets are?—I observed them as being erected principally between the Mumbles and Oystermouth village, and that end of the weirs.

57,402. Are they set at right angles from the shore, with the nets stretching down towards the sea?—There is no particular direction observed by the persons who set them. Sometimes they are set across. They are generally set in front of the flood; and they are principally constructed by the erection of poles, to which they are hung.

57,403. What is the depth of the net?—In some cases I have observed a net of something like four or five feet deep.

57,404. Do you know what the mesh is?—No, I do not.

57,405. May anybody set these nets along the shore?—Yes.

57,406. There is no exclusive right of setting them?—I never heard of any exclusive right.

57,407. What time of the year are they set?—In the spring months.

57,408. What condition are the fish in then?—In excellent condition.

57,409. Are they full fish?—Yes, very full.

57,410. Do they spawn in the bay?—I do not know.

57,411. Do you agree with the last witness, who told us that the herrings have not been here in great abundance for the last five or six years?—I do.

57,412. Previous to that time, were they more abundant?—Yes.

57,413. Used they before that to come in with regularity?—No, they were irregular in their visits.

57,414. Do they ever take the fry of herrings in the weirs?—Yes, they do.

57,415. In any quantities?—I have seen them in quantities.

57,416. At what time of the year?—In the spring and summer months, and in the autumn occasionally. I have also observed great quantities of small mackerel taken in the weirs.

57,417. Have you observed greater quantities of young herring to be found the year after the herrings visited the bay, or did they come every year into the bay?—As I have said, their visits have been very irregular. The young and small ones came the year after.

57,418. They generally came the year after the herrings had been in abundance?—Yes.

57,419. (*Mr. Caird.*) Do you know whether there are any mussel-beds in the bay?—There are but very few. I think the mussel-beds may be found on the other side of this port.

57,420. To the east?—Yes.

57,421. Are they fished for any purpose; for market or for bait?—Not for market. They are principally fished by persons for their own use.

57,422. For bait?—No, for food. The French sailors especially are very fond of them.

57,423. Are they not sent to the market at all?—No, they are not.

57,424. They have not become an article of trade for the market?—No, they have not.

57,425. On other parts of the coast, we have found that they have to a large extent?—That is not the case here.

57,426. Are the mussel-beds valuable or extensive?—No.

57,427. Is the quantity of mussels obtained declining or increasing?—I cannot tell you, but there are fishermen here who can.

57,428. Is there any other point on which you wish to make a statement?—Not that I am aware of.

57,429. (*Mr. Lefevre.*) Were the weirs inquired into by the Salmon Fishery Commissioners?—Yes, they were.

57,430. Were they excepted in the Act?—I have got a copy of the bill, and I rather think they were referred to in it.

57,431. (*Mr. Caird.*) But by the Act of Parliament, as it now exists, they were permitted to remain?—So I apprehend; that is my view of the question. I visited the stake-nets and weirs with Sir William Jardine, the Chairman of the Commission, for the purpose of showing him their effect on the fisheries.

The witness withdrew.

DANIEL BENSON called and examined

D. Benson.

57,432. (*Mr. Caird.*) Are you a fisherman here?—Yes. I am the owner of two weirs.

57,433. What part of the coast are they on?—On this coast.

57,434. Do you rent them?—Yes.

57,435. Where are they?—Near the infirmary.

57,436. Can you show us on the chart whereabouts your weirs are?—They are here (*pointing out the position*).

57,437. Are those weirs all set in succession, and touching each other?—Not exactly.

57,438. Are they close to each other?—There is room for a cart to pass between them.

57,439. Between every one?—Yes.

57,440. In no place is there room for more than a cart to pass?—No; except at the east end, which is all open together.

57,441. For how far is it open?—Up to the pier. There are miles of it open then.

57,442. Are there no weirs there at all?—No, nothing at all.

57,443. What length of sand is there from this point to this (*pointing to the map*), where the weirs are set successively?—Somewhere about three-quarters of a mile.

57,444. Have the weirs been extended at all within recent years, or have they diminished?—Neither the one nor the other.

57,445. Do you remember them for many years back?—Yes.

57,446. How long?—About 20 years.

57,447. And were the weirs made in exactly the same form then that they are now?—Yes.

57,448. And they do fish all the year round?—They do not fish all the year, because in neap tides we cannot go near them.

57,449. But the weirs are there?—Yes.

57,450. Continually fishing?—Yes; but they cannot catch any fish when the tides are all over them. At neap tides, the tides do not leave them for three or four days.

57,451. And the fish can get away?—Yes.

57,452. Not if they get into the basket?—Yes, they can get away again. We can see them often going backward and forward.

57,453. Are there no means of taking down the weirs at any time of the year?—They are always fishing, except there is a gale of wind.

57,454. Is there no Sunday or other day on which the weirs cease to fish?—No; nothing of the sort; only the neap tides.

57,455. What may be the length of the opening between the two wings of the weir?—About 100 yards.

57,456. And what depth is it from the centre of the opening to the mouth of the basket?—About 70 yards from the arm down to the butt of the basket.

57,457. The height is about six or seven feet?—About five feet.

57,458. What description of fish do you catch in the weirs?—Generally whiting and sprats.

57,459. Does it vary in different seasons of the year?—Yes; but we have not been doing much with them for several years past.

57,460. In what season do you catch most fish?—In the winter fishing.

57,461. When does it begin?—In this month.

57,462. In the month of October?—Yes.

57,463. Until when does it last?—Until the month of January.

57,464. What kind of fish do you catch?—Whiting, flat-fish, and a few herrings.

57,465. Any soles?—Very few soles.

57,466. Turbot?—A chance turbot; but I have not taken one turbot this summer.

57,467. Any smelts?—Very few. Perhaps I may have had half-a-dozen pounds this summer.

57,468. Is this a good place for fishing smelts?—No, very poor. I have never seen half-a-dozen pounds of smelts taken at once.

57,469. Are whiting increasing or diminishing in quantity?—They are very scarce. The weirs will hardly pay anything at all now.

57,470. After January, what do you get?—Very little. Sometimes we get a few mullet and basse.

57,471. From January until when?—From January until May, or all the summer round.

57,472. Does the fishing begin to improve in the month of May?—No, it is very slack.

57,473. Is it slack the whole of the season?—Yes; the whole of the summer.

57,474. Up to the month of October?—Yes.

57,475. Do you visit the weirs every day to see if there are fish in them?—I have only been down to them one night this week.

57,476. Do you sometimes find fish dead in the basket?—No; except sprats, which if they are not taken out get meshed in the basket, and die there.

57,477. In the spring tides do not the weirs become completely dry?—There are three feet of water always inside.

57,478. In the basket?—Not in the basket altogether; but it is impossible for the fish to die.

SWANSEA.

D. Benson.

8 October 1864.

57,479. Is there any water in the basket ?—Yes, about two feet.

57,480. At all times of the day ?—Yes.

57,481. Even at the lowest spring tides ?—Yes; there is always two feet of water in it.

57,482. So that if the fish are caught there, they are always alive ?—Yes, until they are taken out.

57,483. Is the basket sunk in the sand ?—No, it is not.

57,484. How can the water remain there if the tide goes away beyond the basket ?—We keep it down in a certain depth of water, so that the fish can always run over a portion of it.

57,485. It is sunk in the sand then ?—Yes, the round part of the basket is laid down in the sand.

57,486. What depth in the sand ?—Sometimes more than two feet.

57,487. Your object is always to have water in the basket ?—Yes.

57,488. (*Mr. Lefevre.*) Then the tide may recede altogether from the weir ?—Yes, it does.

57,489. Leaving a pool of water in which the basket is sunk ?—Yes.

57,490. (*Mr. Caird.*) It is always open at the mouth of the basket, where the fish go in ?—Yes, it is always open.

57,491. Do you keep the lid locked ?—Yes ; there is a small door in the basket, and it is locked.

57,492. That is to prevent anybody from taking the fish out ?—Yes.

57,493. Might they not take it out through here (*pointing to the model*) ?—Yes, they may take some of it, but not all. They could not reach well into the bottom from there.

57,494. What are the dimensions of the basket ?—Between five and six feet long, and about three feet six inches in depth and width.

57,495. What is it made of ?—Small wicker-work ; hazel in general.

57,496. Do you know whether this description of weir for fishing is used on any other part of the coast, except here ?—There is one at Llanelly on the Carmarthen shore, about 12 miles off. There are one or two there.

57,497. How many years have you been fishing with these weirs ?—About 16 years.

57,498. During those 16 years, have you found any increase or decrease in the quantity of fish you can take ?—There have been less fish taken since a heavy frost we had eight or nine years ago, than previously.

57,499. What influence had the frost on the fisheries ?—I do not know. We had great quantities of herring in then ; but we have had none since.

57,500. Do you catch many herrings in that way ?—Sometimes.

57,501. Have you had any large takes of herrings in that net ?—There have been a few taken, but not a great number.

57,502. And since that frost which you mention as having occurred nine years ago, has the fishing decreased ?—Yes, it has.

57,503. Have you had no good fishing by means of these weirs for the last two or three years ?—Sometimes we have.

57,504. What do you pay as rent for the use of your two weirs ?—We rent the ground, and then we have to build the weir ourselves.

57,505. What do you pay for the ground ?—We pay the Duke of Beaufort 1*l.* a year.

57,506. For each of them ?—Yes.

57,507. (*Mr. Lefevre.*) Is it expensive to keep up one of these weirs ?—Yes, very expensive. The building of one of these weirs cannot be done for less than 20*l.*

57,508. How long will it last ?—Sometimes not 12 months. A heavy gale of wind will knock them all to pieces.

57,509. Do you have them on lease ? —No.

57,510. But is there a sort of understanding that you are to continue in possession, as long as you pay your rent ?—Yes.

57,511. (*Mr. Caird.*) Is the whole quantity of fish you get in the course of the year from these weirs considerable ?—No ; they have not paid for attendance. For the last 12 months they have not paid for attending to them.

57,512. For some years back, have they not been a matter of importance to the men who rent them ?—No, nothing to speak of. There are a few sprats in now ; but the weirs have not paid for some time.

57,513. Do you get many sprats in them ?—Yes, occasionally. I took nearly three hundredweight yesterday evening.

57,514. Are they more destructive of small fish, like sprats, than large fish ?—Not at all.

57,515. When you have a good take in one of those weirs, what may it consist of ; what different kinds of fish ?—It is not often that we get a good take.

57,516. But when you do get a good take, what does it consist of ?—The take I had yesterday is the largest take I have had for some time. There were from 250 pounds to three hundredweight of sprats.

57,517. Do you correctly represent the feeling of the other people who fish these weirs along the coast, because, if so, it appears not to be a matter of great importance, even to the fishermen, that the mode of fishing should be continued ?—If they were destroyed, it would not be such a great loss to them. Of course, the greatest loss would be the expense to which they have been put in building the weirs.

57,518. Merely that ?—Yes, that would be the greatest loss to them.

57,519. Would there be a great loss to the public if these weirs were done away with ?—There would be no sprats now if the weirs were not there, and fish in Swansea have become very scarce.

57,520. If the weirs were removed, do you think that the supply of fish to the market would be greatly lessened ?—In the winter time it would be. We should not be able to catch whiting as we do now.

57,521. Could you not catch them as in other places ?—Not as well.

57,522. Could you not catch sprats, as in other places, by nets ?—I don't know how they do in other places ; but our sands are very shallow.

57,523. Have you heard it alleged by the fishermen who do not have these weirs, that the weirs are very destructive to the brood of fish ?—I do not think that they do catch the brood of fish.

57,524. Do they not catch small fish ?—If they do, we throw them into the water again.

57,525. Are they alive or dead when thrown back ?—They are alive. It is impossible to kill a sole. A sole will live for 12 hours.

57,526. Have you never seen them dead when you have taken them out of the nets ?—No, I have never seen them dead.

57,527. And do you think that all you throw away go back to the sea ?—Yes; they are thrown back into the water, and they return to the sea.

57,528. (*Mr. Lefevre.*) Do you throw them back into the basket, or into the sea ?—Not into the basket ; but into the pool of water outside the weir.

57,529. (*Mr. Caird.*) Then, when the tide comes up, have they an opportunity of escaping ?—Yes, they go away to the sea again.

57,530. How many weirs are there of that description altogether ?—Thirteen.

57,531. Thirteen altogether ?—Yes ; 13 altogether.

57,532. And they are all rented yearly in the same way ?—Yes ; I think so.

57,533. They pay 13*l.* a year to the proprietor ?—Yes ; Mr. Vivian has three, and I think he has the right to them himself.

57,534. Does he fish them ?—His men do.

57,535. Are they fished in exactly the same way as yours ?—Yes.

57,536. With the same results ?—Yes.

57,537. Do you catch any salmon ?—No salmon

have been caught on these sands this year. I have only caught five salmon for these 16 years.

57,538. Are there many salmon caught in the bay? —No; very few.

57,539. Not by any other means?—No; there are a few sewin taken, but not salmon.

57,540. Sewin, or sea trout?—They call them sea trout, I believe, in England.

57,541. (*Mr. Lefevre.*) Do you catch many flounders in them?—Not so many since the patent fuel works were erected here. They have destroyed more fish than anything else.

57,542. Where are they?—Close by in the river.

57,543. Do they discharge their refuse in the river? —Yes; the coal-tar comes down into the bay.

57,544. And that has injured the fishing?—Yes; more than anything else.

57,545. Do you not agree that a great number of young herrings are taken?—No; and I never saw the last witness down to see the fishing.

57,546. Do you take any young herrings in that way?—A few sometimes.

57,547.—Do you sell them?—They are herrings three parts grown.

57,548. What length are they?—Six or seven inches long.

57,549. They are marketable fish, and fetch a price in the market?—Yes; they may fetch a halfpenny apiece.

57,550. Have you observed much shrimping inside this bay?—Yes; sometimes.

57,551. Do the shrimpers catch any quantity of small fry?—They catch as much outside as inside, and more so, because we do not allow them to fish in the weirs.

57,552. Not inside the weirs?—No.

57,553. Is there any shrimping in boats with a trawl?—No.

57,554. All is done by the hand?—Yes; with a net six feet or eight feet long.

The witness withdrew.

George Grant Francis called and examined.

G. G. Francis.

57,555. (*Mr. Caird.*) You live in Swansea?—I live in Swansea.

57,556. And you have turned your attention a good deal to the sea fisheries?—Not a good deal to the sea fisheries directly, but more indirectly, in consequence of complaints which have been made by the inhabitants to me as taking a great interest in the locality. I made an application last spring to the Government on the question of the fish taken and destroyed in this bay, and after going to the Treasury and being sent about to a variety of offices, and happening to be rather short of time, I got into the hands of the wrong Commissioners. They told me they were the Salmon Commissioners, and I failed altogether to find out the proper people to communicate with.

57,557. Do you desire to make any representation to us on the subject of the fisheries in this bay?— Yes.

57,558. Will you kindly do so?—My attention has been drawn to the state of the fishing in this bay for some years, but more especially within the last twelve months, in consequence of those who frequent the weirs having an impression that the system carried on by the owners of the weirs is extremely faulty. I am very glad to have been in the room when Benson, the last witness, was examined, because it will save a great deal of trouble. That fisherman is a man of considerable experience here, but he has altogether lost sight of his own interest and the public interest in the fact that the formation of those weirs is of so close a character that the young fish are destroyed. It is difficult to use words which would properly convey an idea of the number of small fry taken and destroyed by those instruments, but there are hundreds of thousands of them.

57,559. Do you speak from your own observation? —Yes; hundreds of thousands of the small fry of all descriptions of fish are caught in the base of these triangular weirs which are so closely filled up at the bottom that escape is impossible. On many occasions, persons knowing me to be greatly interested in the welfare of this locality, and being what is commonly called a public person, have applied to me in order to ascertain whether something could not be done to prevent that enormous waste of small fish whereby the habitat of the fish, so to speak, is destroyed. Those fish which would frequent the bay from a love of home, perhaps, or from some other natural causes, if they are not allowed to grow into a middle age, will never become adults; and there is an impression here that the wicker-work in these weirs is filled up at the foot with small branches with leaves upon them, which grow so close to the foot that it is impossible for anything to pass through them.

57,560. What have you observed yourself; what facts can you state to us from your own observation? —I have seen large quantities of small fish amounting to hundreds of thousands detained, and dead in the bottom of these weirs.

57,561. Have you seen them dead?—Yes, I have.

57,562. The previous witness stated that they are detained, but that there is always plenty of water to keep them alive?—I am sorry to differ from him.

57,563. You can speak of having seen the fish dead?—Yes.

57,564. You have seen them yourself?—Yes.

57,565. In vast quantities?—Yes. I state that as a fact, and if I might be allowed to follow up my statement to you as I have done before former Royal Commissioners sitting in this place, I will supplement it by a statement of facts, or I would have no objection to go to London and complete my evidence there. If I had had an idea that you were going to sit here to-day, I would have been better prepared than I am at present.

57,566. We shall be glad to hear any statement you have to make. We understand that you, from your own observation, have seen that this mode of fishing is very destructive to the brood and fry of the fish that frequent this bay?—Most undoubtedly.

57,567. Are you aware that it has caused any decline in the general productiveness of the fish that frequent this bay?—That is my decided opinion, and it is the opinion of persons who have much larger opportunities of discussing the question than I have.

57,568 Can you tell us from your own observation whether these engines yield large quantities of marketable fish to the market?—They do not. The last witness has properly stated that so little fish does he find in his weirs that he has only been at them once a week.

57,569. Is that the general feeling among the fishermen who fish with those weirs?—The general impression among those I have conversed with is that they yield a very small and uncertain supply.

57,570. It would appear from what has been stated by the last witness, and from what your information has led you to imagine, that the weirs are neither profitable to the men who fish them nor to the owners? —My impression is that the Duke of Beaufort does not derive, and much less do the fishermen who rent the weirs, that profitable use from them that the skilful adaptation of means to ends would justify in this bay. We have a right to believe that when hundreds of thousands of fish frequent this bay as a natural habitat, if they were properly cultured we should get in increasing quantities a very large and valuable supply daily.

57,571. That is a matter of opinion; we want to know what quantity of fish is supplied to the market from this mode of fishing?—It is unusually small from so large an area.

57,572. Do you know anything about the herring stake-nets used in the bay?—No, I do not.

SWANSEA.

G. G. Francis.

8 October 1864.

57,573. (*Mr. Lefevre.*) Are you a member of the corporation here?—I am not now, but I have been; and I have been mayor of the borough.

57,574. Has the purchase of these weirs ever been contemplated by the corporation?—No.

57,575. Would it not be desirable to buy up the weirs if they are so destructive to the interests of the town?—That question was never brought before the public body while I was a member of it.

57,576. You are aware that these are private rights which have been exercised from time immemorial. I presume, therefore, it would be necessary to buy up these rights if anything were done. Is the corporation of Swansea ready to go to that expense?—I am not able to say. The corporation here are a very liberal body, and representing the town properly, whatever would be for the general benefit of society, and especially of the municipal borough, I think they would willingly enter into. The Duke of Beaufort and his ancestors have had these weirs; but many persons have discussed the question whether weirs are property.

57,577. Would it be possible to use the weirs without causing a great destruction of small fry?—The same principle that applies to properly skilled fishing of all descriptions ought to be followed here, and that is not to destroy the future supply by killing the young.

57,578. I quite understand that; but would it be possible to fish with those weirs in such a way as not to cause a great destruction of young fry?—That is a moot question, and I would not like to give a positive answer to it.

57,579. Have you formed any opinion upon it?—My opinion is that at present they are decidedly too close for fishing. If they were used at all, that should be so constructed that while the net could take proper sized fish, the small fish could get away without being detained.

57,580. Would it be possible to construct them in such a way that the small fish would get away, and only the large ones be detained?—I think so.

57,581. You told us that you have seen great quantities of small fish in them dead?—Yes.

57,582. Have they been in the water?—Yes; large quantities live, but they cannot get out. This is such a close beach that the action of the sea is unable to drive them out.

57,583. Have they been there in such quantities that they have been left dry by the receding tide?—Yes.

57,584. Have they not gone into the water?—No; large quantities have tried to get out, but they could not.

57,585. Have you examined those small fish to see what they were?—No.

57,586. Can you say what description of fish they were?—They were very much in appearance like whitebait.

57,587. Like whitebait?—Yes, to the eye, but I have not examined them carefully.

57,588. Did you take the trouble to see if they were soles, flounders, mackerel, or herrings?—I can state that apparently they consisted of round white-fish, and white-bellied fish.

57,589. But what were they?—Small flat-fish, small soles, small cod, and small whiting. I can recollect identifying those fish, but I have no doubt there were many others.

57,590. You say you think a weir could be constructed so as to prevent the take of small fish; can you point out in what way that could be done?—The lines along the bottom of the weirs at present are filled with small branches covered with quantities of leaves, so close that they prohibit the passage through the weirs of anything small.

57,591. But when the tide recedes it would not much matter what the nature of the stakes would be, whether they were set widely apart or closely, because the fish would remain?—If the opening was sufficiently large the small fish would get away.

57,592. Is it not necessary to have this erection of stones to protect the weirs?—No, I think not.

57,593. Do you think the stakes might be supported without the erection of stones?—I think so; it is a mere temporary rough expedient.

57,594. You do not think it would be necessary to do away with these stake-nets altogether?—That I am not competent to say. I think if the men here fished properly, as on other parts of the coast, they would not require these weirs, but would obtain plenty of fish by other means.

57,595. The corporation of Swansea have never discussed the question whether it is desirable to buy up these weirs for the interest of the town?—No, not to my knowledge.

The witness withdrew.

G. Harry.

George Harry recalled and examined.

57,596. (*Mr. Caird.*) How far does the borough of Swansea extend?—The borough of Swansea, over which the corporation takes an interest, does not extend to where the weirs are erected.

The witness withdrew.

G. G. Francis.

George Grant Francis recalled and examined.

57,597. (*Mr. Caird.*) The borough of Swansea does not embrace the whole of the weirs?—No, only those which lie between Brynmill Park and the river Dowey.

57,598. Then does the borough contain a considerable number of the weirs?—Yes.

57,599. Is it within your own knowledge that the supply of fish from the trawlers has decreased of late years?—Yes, certainly. I understand from the men themselves that the fish are gradually getting less and less, and that they are not worth following. We are very remarkably situated on this coast, sometimes we cannot get a bit of fish even for dinner for two or three days in the week.

57,600. Is there not a good deal of fish landed here by vessels fishing in Carmarthen Bay and sent off to markets in this district?—I should doubt if much fish is landed now, because different branches of the railway go to all the ports in South Wales, and there are places all on the coast equally accessible to the fishing vessels.

57,601. Were the trawlers formerly in the habit of landing more fish here than they do now?—I think so.

57,602. Does that account for the supply of fish in Swansea market being not as great as it was formerly?—Yes, I think so.

57,603. Have you observed whether there are greater quantities of these small fry at any particular time of year?—I cannot answer that question. I observed them at one time much larger in quantity than another, but I have nothing to indicate in what period of the year I made that observation.

57,604. You cannot say when the largest quantity of small fish is found?—No.

The witness withdrew.

DAVID EVAN MICHAEL called and examined.

SWANSEA.
D. E. Michael.
8 October 1864.

57,605. (*Mr. Caird.*) You are an oyster fisherman from the Mumbles?—Yes.

57,606. Have you been long acquainted with the oyster fishery at Swansea?—Yes, since I was a boy I was brought up to it.

57,607. Has the number of boats employed in the oyster fishery increased or diminished?—It has increased very much.

57,608. Have they increased of late years?—Yes.

57,609. What is the increase altogether?—I can tell you with regard to the Mumbles, but with regard to other parts I cannot.

57,610. Do they include other places?—Yes, Portatyn and Swansea.

57,611. What number is there at Mumbles?—About 66.

57,612. Are they the same class of decked boats as those which are used here?—Yes.

57,613. With three men in each?—Yes.

57,614. How many are there in Swansea?—About eight, and there are 12 in Portatyn, and 66 or 68 in Mumbles.

57,615. The number within your knowledge is increasing?—Yes.

57,616. Are the boats of a different class to what they used to be in former years?—Yes.

57,617. Are they larger boats?—Yes.

57,618. Do they carry a larger dredge?—No.

57,619. They carry two instead of one?—Yes.

57,620. They do double the amount of work?—Yes.

57,621. Do you fish on the same ground for oysters now that you have frequented for many years back?—Yes.

57,622. Can you tell us how far westward you go?—We go down nearly to the Worms' Head.

57,623. Not any further west than that?—No, we do not go as far west as that.

57,624. How far do you go to the east?—I should think about a mile from the Fairway buoy, as near as possible.

57,625. How far south?—To the White Oyster Ledge. We go about two miles above that.

57,626. Do you go as far as the red revolving light?—No, not as far as that.

57,627. (*Mr. Lefevre.*) You do not go out as far as Lundy Island?—No, we scarcely ever see it.

57,628. (*Mr. Caird.*) Do you vary your ground in fishing much during the season?—We vary with the winds.

57,629. Do you find now upon the same ground that you have fished for many years back, as many oysters as you used to get?—I am very sorry to say it is not so.

57,630. Then you do not agree with the witness who tells us that he finds as many oysters as ever he did?—That is all moonshine.

57,631. Do you think they are getting scarcer?—I am sure they are.

57,632. Does one boat not get as many oysters as it used to get?—No.

57,633. There are a great number of boats, you tell us?—Yes.

57,634. But each boat does not get as good a catch?—No.

57,635. Can you tell us the difference in your experience between a good catch now and one 10 years ago?—I have been going out in a morning seven years ago, and have had seven hauls; and I have brought in as many as 8,000 oysters.

57,636. In seven hauls?—Yes. Now I may go out all day, and if we come back with 3,000 or 4,000, we think we do very well. We consider 4,000 an extra day's work.

57,637. Four thousand oysters?—Yes.

57,638. Are the oysters much of the same quality and size as they were when you got those larger hauls?—Yes; about the same. I do not see much difference in them.

57,639. Do not you catch a larger proportion of small fish now?—No.

57,640. What do you consider the reason of the decline in the yield of oysters?—The continual dredging.

57,641. Are there more people employed upon it?—Yes.

57,642. Do you think the beds are over-fished?—Yes, I do fancy that they are rather over-fished at the present time.

57,643. Have there been good years for spat lately?—I have not seen any. This last summer there were some symptoms of it; but I am not exactly up to the mark, and cannot understand these questions. I have been trying to understand the spat, but I have not been able to do so. There has not been much upon our ground as yet. It has scarcely shown itself yet.

57,644. Have you not observed that at some seasons you have a better brood than at others?—Yes.

57,645. Within the last four of five years has there been generally a good brood?—No.

57,646. Has it fallen off?—Yes, it has rather fallen off to what it has been.

57,647. Has that had any effect in causing the decline in the oysters of late?—Well, I fancy it must; because the ground has been so much disturbed that if the spat lit upon it at all, the boats were continually going over it.

57,648. Do you think the disturbance of the ground is injurious to the oyster-fishing?—I do not fancy it is, and we could not avoid it, although we have a large space of ground to go over. There are 60 boats going down and across the channel, and they take everything almost before them. I know of instances where we used never to throw a dredge in, where they have now been taking out oysters too small to be marketable.

57,649. And in that way the oyster-beds have been injured?—Yes, they have been injured I think.

57,650. Are there any oysters brought from any other part of the coast and laid down on any of the beds here, for the purpose of fattening or growing?—No.

57,651. That has never been practised?—No, it has never been practised.

57,652. Is there any suggestion you have to offer to us as to any mode by which oyster-fishing might be improved?—No, I do not know that I could suggest anything; but as you have given me the chance, perhaps I may speak with regard to one thing which we think will be a disadvantage.

57,653. Yes; we shall be glad to hear all you have to say?—We have been thinking, and I think it is a fact that cannot be controverted, that the railway which is about to be formed at the Mumbles will very much injure us as a fishing port.

57,654. In what way?—They are going to bring the railway down close to where the boats are lying at their moorings, and I think we cannot have such a fishing port in future as we have hitherto had; for instance, our boats in landing and getting off, will be in great danger of being destroyed.

57,655. Is that in reference to the harbour there?—Yes.

57,656. And the facilities you have in going to sea and coming in?—Yes.

57,657. Has it anything to do with the oyster beds, and their productiveness?—Whether it would injure the beds or not, I cannot say; that would have to be proved.

57,658. It does not directly affect the boats in any way?—No.

57,659. Is there anything else you have to mention to us?—No.

57,660. Is there any regulation among you as to the size of the oysters you may catch?—Yes; they must be 2½ inches across.

57,661. All oysters below that size are not marketable?—No.

SWANSEA.

D. E. Michael.

8 October 1864.

57,662. Would the dealers not buy them from you?—Whether they would buy them or not, our Coast-guard would not allow us to sell them.

57,663. They look after you?—Yes, I have had them on board of my own craft.

57,664. Do the fishermen pretty steadily adhere among themselves to not bringing ashore small oysters, smaller than $2\frac{1}{2}$ inches?—I believe they do, in general.

57,665. Have you any remarks to make with regard to the oyster season here; is there any feeling among the fishermen that the close-time should be altered or increased?—At one time we did get up a petition, and sent it to Parliament, to have the month of May for dredging; but on the whole I believe it would be better to leave it as it is. We have got from September until April, which gives us eight months in the year, and I fancy that that is quite long enough to be continually dredging on the same ground.

57,666. Then, if such an opinion did exist among the fishermen before, it is not now their opinion that the month of May should be taken from the close-time?—I have never heard anything of it since. That happened to be a very poor season with us, and we thought we would get up a petition. We did not wish to disturb any ground we had been on for the eight months; it was simply that we might be enabled to go in search of better beds of oysters. There are oysters over at Lymouth which cannot be caught here; but in May we could go over and catch them, and market them; and if they are left there, they are left to die.

57,667. Do not the fishermen of Lymouth fish them?—No.

57,668. Not at any season?—No.

57,669. You cannot fish them earlier than May, on account of the open character of the coast?—Yes.

57,670. When do you first find the oysters getting milky?—In July.

57,671. Not before that?—No; in July and August.

57,672. Do you find the oysters in a good condition in the month of May?—Yes, they are very good.

57,673. It is not on account of the oysters being out of condition then, that the desire against having a fishing in the month of May has arisen?—No, not at all.

57,674. But simply to give the oysters rest?—It is the best month we could get in the year for selling oysters.

57,675. And the oysters are in good condition then?—Yes.

57,676. Are they in good condition in September? Yes.

57,677. And during the whole of the winter months?—Yes.

57,678. What do you do in the summer months, when you are not oyster-fishing?—The boats are generally laid up, and the men go to sea.

57,679. As sailors?—Yes.

57,680. They do not take to any other kind of fishing?—I think there were one or two boats that started trawling last summer.

57,681. Deep sea-trawling?—Yes.

57,682. Were they successful?—They fished for 5*s.* or 6*s.* a week.

57,683. Each man?—Yes; and I suppose they wound up their boats.

57,684. They did not find it profitable?—No.

57,685. Do you ever do anything at seining?—No; some chance times they seine when the mullet are in in the summer time.

57,686. Do you seine for mackerel?—No, not for mackerel.

57,687. Have you had any experience with these fishing weirs?—Yes, a little.

57,688. What do you think of their effect upon the interests of the fishing here?—If I must be candid and plain, I think they ought to be destroyed.

57,689. Do you think they do any harm to the fishing interest?—I am certain they do.

57,690. Do they kill large quantities of the brood and fry?—I cannot say; but I have seen large numbers from the time I was a boy.

57,691. Have you seen large numbers?—Yes; quantities of them.

57,692. Dead?—Yes.

57,693. Dropped inside?—Yes, inside and out. If they get out they get on a bank, and cannot get to sea. They are fixed altogether.

57,694. What is done with them?—The birds take them. They are dead, or they cannot survive in a low spring tide. The tide is a mile outside of these weirs in a low spring tide.

57,695. Is there nothing but sand except within the basket?—They are left quite dry. Sometimes there is a little pool formed there, and the fish are deposited there, and are all alive. It is a splendid sight to see them. But in some of the weirs the water will run out and leave them quite dry. Common sense will tell you that fish under those circumstances must die ultimately, after being left dry for two or three hours.

57,696. But where there is water, they are alive?—Yes, they are all right enough then. They have a small net by means of which they pick up those fish. They take out what is marketable, and drop the other out on the sands, in such a way that it is impossible for them to get out to sea.

57,697. What description of fish have you seen thrown out upon the sand, and left to perish in that way?—Whiting, ling, codfish, and different others.

57,698. Soles?—Yes.

57,699. Any large quantity of young soles?—Yes, very small.

57,700. Any turbot?—Yes, small turbot now and then.

57,701. You think there is a great destruction of the brood of fish by those nets?—There is no mistake about it.

57,702. Every year?—Yes, every year.

57,703. Have you yourself often gone to look at the nets; have you ever fished them?—I have been there scores of times. I have been up there as a boy getting small fish, after they had been left in that way.

57,704. Have you ever fished them yourself?—I have been fishing them after the owners have been taking the fish out with the small nets. I have got a small basket perhaps of sprats, and whiting, ling, and gurnard, and of the small fish they would not take.

57,705. Is it the general opinion of the fishermen here, that these weirs are destructive of the brood of fish?—It is so with us.

57,706. If they were taken away, could the fishermen by other means get the same fish, or an increased quantity of fish?—I believe our bay would be very prolific of fish, if these weirs were done away with.

57,707. You think it would greatly increase the quantity?—There is no mistake about it.

57,708. (*Mr. Lefevre.*) Have you observed the same quantity of small fish year after year in these weirs?—Yes; and I have been brought up there from a boy.

57,709. For the last two or three years, have you observed the same quantity of small fish as you did when you were a boy?—Yes, near about the same.

57,710. Have you ever observed when the tide has receded, and the water has been left in a pool in the weir in the summer time, that small fry have been killed by the heat of the sun?—One half of them will be killed, because they have not enough water, and they all get together. The consequence is, that one half of them die.

57,711. Have you ever observed that in cases where there are no weirs, and the young fish are caught in pools of water in the bays, when the water has receded, a quantity are killed by the heat of the sun?—I cannot answer that question.

57,712. Have you never seen it?—No.

57,713. Is there any mode of fishing the weirs without causing a destruction of small fry?—I ques-

SWANSEA.

D. E. Michael.

8 October 1864.

tion if there is, except by using a net of a proper mesh.

57,714. Would it be possible to have permanent stakes and hurdles, without stones behind, so as to allow the small fry to escape through the stakes, and go away with the receding tide?—I question it.

57,715. Is it absolutely necessary to have this erection of stones, if they are to fish these weirs at all?—I do not fancy that they have any need of it, because the stakes are driven down into the clay; but we have very coarse weather here sometimes.

57,716. With regard to the oyster-fishing, do you think there are large beds of oysters in the deep water in the middle of the channel which are not fished by the oyster-boats at present?—That was the very reason we petitioned to get the month of May.

57,717. You believe there are such beds?—Yes.

57,718. Beds that you are unable to fish in the winter time?—Yes.

57,719. Do you recollect the fishing before the close-time was enforced?—Yes.

57,720. Did you fish the beds then?—No; we had smaller boats then, and we were obliged to keep nearer the shore.

57,721. Could you not go that distance in the summer time?—No; we could not venture out.

57,722. Have you observed any difference in the condition of the oysters which you have taken up towards the close-time, with regard to the spawn?—Yes.

57,723. Do you think they spawn at different times, according to the depth of water in which they lie?—I cannot say.

57,724. Have the oyster dredgers of Mumbles got any oyster-beds on which they lay down the oysters?—No.

57,725. Are there any oysters here?—There are no regular beds on which they deposit them; but when they come in, they lay them down, and take them away again in a few days.

57,726. They are merely thrown down?—Yes, there are no beds.

57,727. They deposit them in perches?—Yes.

57,728. What are those perches?—When the boats go out and have one or two days catch, they put them down in these perches which we rent from the Duke of Beaufort.

57,729. What is the size of them?—Some of them are not as large as this room.

57,730. Do you lay them down there until they are fit to send to market?—Yes.

57,731. Do they fatten there?—No; they are only laid down for our convenience.

57,732. Do you lay down many to supply the market after the close-time?—There are a good few laid down sometimes.

57,733. How long are you able to supply the market after the close-time?—Up to July, and sometimes through August.

57,734. In May, June, and July?—Yes.

57,735. And sometimes through August?—Yes.

57,736. Then you are very nearly able to supply the market during the whole of the close-time?—It is a very small supply. There are only a few that are deposited down, just a few that are required for sauce.

57,737. Is there not a good deal of dredging just before the close-time, in order to get up a supply for the market during the close-time?—It depends on the weather.

57,738. If you are able, you do so?—Yes, and all through the season. It is only the weather that prevents us.

57,739. Do you pay anything for those perches?—Yes.

57,740. How much?—Seven shillings and sixpence each.

57,741. Each of the fishermen has his own perch, on which he lays down his oysters?—Yes.

57,742. Are the boats mostly owned by the fishermen?—Yes.

57,743. What is the cost of one of those boats?—About 150*l.*

57,744. Do any boats come from a distance here, such as the Jersey boats?—No. We had a few from the east many years ago. They came round from London.

57,745. Have they not been here lately?—No, not lately; not for years.

57,746. You do not trawl yourself?—No.

The witness withdrew.

R. Sparkes.

Robert Sparkes called and examined.

57,747. (*Mr. Caird.*) Are you an oyster-fisherman?—I have been; but not for the last 15 years.

57,748. What kind of fishing have you been following lately?—Weirs, stop-nets, and cod-fishing.

57,749. Have you fished the weirs?—Yes, for 40 years.

57,750. Are you fishing them now?—I have part of one. I have not fished them this summer. I have given it up. It is on the other side of the river, and belongs to a man named Harrison.

57,751. Is it in the same form as those on this side?—Yes.

57,752. You have had a long experience of the fishing of these weirs?—Yes, I do not think there are many who have had a longer experience than myself.

57,753. Have you observed, whether in the course of your experience, the quantity of fish taken in the course of a year by one of these weirs, has been increasing or diminishing?—It has diminished very much.

57,754. Cannot you take now as much as you used to take in former times?—Not one third.

57,755. Is the quantity of fish smaller than it used to be?—Three parts of it is small.

57,756. What description of fish?—I have seen hundreds of little cods not three inches long. I have seen hundreds and thousands of them.

57,757. What was done with them?—The gulls had them. They were thrown away, and they died on the sand. Thousands and thousands were destroyed.

57,758. Have you observed a great destruction of small fry by the use of the weirs?—Yes.

57,759. Is the destruction of the fry increasing or diminishing?—Increasing; because as soon as they come in they are all dead and killed.

57,760. Have you altered the shape of your nets at all in your time, or the mode in which they are made?—No, they are all the same.

57,761. Are they so close that nothing can escape that gets inside?—Yes.

57,762. Have you yourself used any other description of net than these weirs?—Yes, I have used a stop-net on the same principle, fixed on a pole.

57,763. Is that as close?—No, not as close as that.

57,764. Can the small fish escape through it?—I have got herrings in my net now that are much too small. If all of them were to be constructed on a good principle, and were to have a good mesh, I think we should have good large fish; the inhabitants would be supplied with double the quantity, and we should be ten times better off than we are now.

57,765. Do you catch sprats now?—Yes.

57,766. Can you catch them with a net?—Yes, if I had a proper sprat-net, and not a destructive net like that. We ought to have a regular sprat-net, and not fish with nets like these all the year round.

57,767. You do not catch sprats all the year round?—No; only from about this time up to Christmas. After that we have nothing but thousands of little herrings, the fry of the herrings.

57,768. Is there a great quantity of small herrings

SWANSEA.

R. Sparkes.

8 October 1864.

killed by these weirs?—Yes, and sold at twopence a pound. Those which are two inches long we pick up, and the smaller ones are thrown away and die.

57,769. Is there a large take on the whole of those small fish unfit for consumption?—Yes; seven parts out of eight are fit for nothing.

57,770. Seven-eighths are totally wasted and lost?—Yes.

57,771. What do they consist of?—Small soles, brill, cod, small hake, and small pilchards in thousands.

57,772. Is it the case that some of them do not die, but remain alive in the water in some cases in the nets?—In some of the weirs there is a pool about three feet deep. They can swim about in that pool; but in the summer time, with a four hours tide out, the water gets so hot that they all die. They are scalded by the water. I have seen hundreds of conger eels in a hot day come out from under the stones.

57,773. Congers?—Yes; of about half a pound, and from that to two pounds.

57,774. So that even where there is water, when there is a vast quantity of small fish, they die in consequence of the heat of the weather?—Yes, and there are thousands of gulls that come round and will soon take them all away; indeed, they are nothing but food for gulls.

57,775. Do you follow any other kind of fishing; have you been a trawler?—Yes; but never much.

57,776. Have you been a line-fisherman?—Yes, that is my following. I shall commence next week for large cod.

57,777. Is the take of cod increasing or diminishing?—There are not as many as we used to get.

57,778. Do you get good cod?—Yes; and some of them poor.

57,779. Is it the long-line that you fish with?—Yes.

57,780. How long?—A mile and a half.

57,781. How many hooks?—About 300.

57,782. What do you bait with?—Small herrings, and small flat-fish, and small whitings.

57,783. Do you use mussels?—No.

57,784. Nor flukes?—No.

57,785. You can always get plenty of bait, can you?—No, not always. When we are short of bait we dig for lug worms in the sand.

57,786. (*Mr. Lefevre.*) Are you still the lessee of one of these weirs?—I have got part of one; but I have not fished them this summer. I got nothing in it, and I have given it up. It is all good, however, at this time except the basket; the basket has gone.

57,787. Did you give it up because it did not pay?—Yes; I got a stop-net instead.

57,788. Do you think that other people would give them up also?—Yes.

57,789. Do you think it possible to use the weirs in such a way as to allow the young fish to go through?—Not at all. In making them they are intermixed with old straw and matting, and stones, and they are put down into the sand. The stream runs into the basket, and throws the fish into the basket, from which they are fished out.

57,790. Then is there no means of using these weirs in such a way as to allow the fry to escape?—I think not.

57,791. Do you think the weirs ought to be removed?—They ought to be condemned.

57,792. You would like nets to be used instead of weirs?—Yes.

57,793. Nets of the same shape?—Yes.

57,794. During any month of the year do you use nets small enough to catch sprats?—Yes.

57,795. Would they not catch also the small fry of other fish?—No; they would go through the mesh.

57,796. Would small soles go through the mesh?—We catch them very small, a quarter of a pound sometimes.

57,797. But small herrings would be taken with the sprats?—They would go through, unless a little dirt got in and stopped the fry from going out.

57,798. Would you use a different class of net at another time of the year, so as to catch bigger fish?—I think if the small mesh were done away with we should have a better class of fish.

57,799. But the mesh must be small enough to catch sprats?—I think we ought not to have a mesh as small as that.

57,800. You think you ought not to be allowed to catch sprats?—Yes.

57,801. Are you ready to give up the right to catch sprats?—Yes, if the other fishermen would do the same; and in two years time, I think, there would be six times the supply there is now.

57,802. How would they catch sprats?—They would get a net and move it after the sprats.

57,803. You would still use a net for the sprat season?—I do not think it worth while to get sprats.

57,804. I thought you said you were catching thousands of sprats?—They are doing so in the weirs.

57,805. But do you not in your net?—No; they go through.

57,806. What time of the year do you find the greatest quantity of the small fry?—In the summer time. About May they commence, and go on from May until this time; and if the wind is fine, I have seen them so plentiful in the basket that we could not shove the lid down.

57,807. What have you done with the small fry, when you have taken them in such quantities?—Thrown them away.

57,808. Have you thrown them out on the dry land or in the water?—We have thrown them ashore.

57,809. Have you seen them die there?—Yes; and I have seen them baling them out continuously for twenty minutes.

57,810. What proportion of marketable fish would they take at the same time?—Perhaps not 2*s.* 6*d.* worth of fish, perhaps 5*s.* worth, and perhaps only eighteen pennyworth.

57,811. (*Mr. Caird.*) Is the object of loading these weirs with stones on both sides of the net as much for the purpose of getting a stream with the tide in the basket as anything else?—Yes, and to stop the fish from getting out.

57,812. The object is to prevent the fish from getting any other exit?—Yes.

57,813. Is it also to prevent the fish from getting through the basket?—Yes, and to prevent the water from undermining the weir.

57,814. Can the water get out at the end of the basket?—No, it has a plank.

57,815. Where does it get out?—From the sides which are made of basket-work. They make it as close as they can, to prevent the eels from getting in.

57,816. The water does get out?—Yes, or else it would break with the pressure of the water.

57,817. (*Mr. Lefevre.*) Do they take many eels in these weirs?—No; perhaps two or three quarts.

57,818. You spoke of having a net instead of a weir; would you catch the same quantity of fish?—Yes; we should catch three times the quantity, and we could take the net in if it blew hard, or if we wished.

57,819. What would be the cost of a net of that kind?—20*l.*

57,820. Then you would have a different sized net for the sprats?—Yes.

57,821. What would be the cost of that?—About 2*l.* We could put it at the head of the other net.

57,822. Would it only be necessary to have a smaller mesh at the end to catch sprats?—Yes, that is all.

57,823. What kind of trap would you have at the end?—We have got no trap; but we let them come down to the end.

57,824. Is there any water there?—No, it runs dry.

The witness withdrew.

DANIEL BENSON recalled and examined.

D. Benson.

8 October 1864.

57,825. (*Mr. Lefevre.*) You said in your evidence that you had only been down once last week to take the fish out of the basket of your net?—Yes.

57,826. Has that been the case for some time past?—Very often in the summer time we do not go down at all, because there is nothing doing. There are neither big nor small fish, and it is not worth our while to look after the nets. The fish are better in the winter time; from this time until the month of January.

57,827. Has that always been the case since you can recollect in the summer time?—Yes, ever since I can recollect.

57,828. Do you consider that these embankments of stone round the weirs are necessary?—Yes, the weir would be of no use unless it had something of the sort, because the sea would undermine the wicker-work, and the fish would go out under the wicker-work.

57,829. Would it be possible to substitute a net for this hurdle-work?—We have nets of the same shape now, but there is no pool inside the nets, and the fish stop on the dry sand.

57,830. Do you find that you catch as large a quantity of large fish in those nets?—Yes, we catch more in the nets than in the weirs, but the net which has been spoken of has what is called a sprat-mesh, and there are more small fish killed by it in one tide than a weir would kill in ten years.

57,831. If you catch more fish in the nets than in the hurdles, why do not you use the net?—In the winter time we catch fish we could not catch in the nets, such as whiting and sprats; we could not catch them in a large meshed net.

57,832. But you could use a net with a smaller mesh for sprats?—And then we should destroy ten thousand times more than are now destroyed by the weirs. There are very few fish destroyed at all by the weirs.

57,833. Why would you destroy more in the sprat-nets than in the weirs?—Because they pick up everything.

57,834. It is quite as impossible for the small fry to get through these weirs?—If you were able to come down to the bay you could judge for yourselves what small fish could get through.

57,835. Do you say that small fish could go through?—A dog in some places could crawl through them. They are not at all as close as has been mentioned to you.

57,836. Further out in the continuation of the stakes small fry can get through?—They do get through.

57,837. But when they come up towards the basket there is an embankment which confines them?—They can come out over the embankment above the wicker-work. At low water there is always sufficient water for them. There is a depth of water up to the height of the stones, and it is deep enough for the fish to swim about at all times.

The witness withdrew.

FRANCIS PRICE called and examined.

F. Price.

57,838. (*Mr. Caird.*) You are agent to the Duke of Beaufort?—Yes.

57,839. You have heard the evidence which has been given to us?—Yes.

57,840. Have you, as agent to the Duke of Beaufort, any remark to make?—I have no part to take in the inquiry. I merely came here to listen to what took place.

57,841. (*Mr. Lefevre.*) Does the Duke of Beaufort claim the right of setting any kind of net along the foreshore?—Yes, anything.

57,842. He claims the right of doing what he likes on the foreshore with regard to catching fish?—Yes.

57,843. He claims the foreshore for any purpose whatever?—Yes, he claims to deal with the shore and the sand in any way he thinks proper, irrespective of either the corporation or any body connected with the neighbourhood.

57,844. For how long a distance on the shore does he claim that right?—For 20 miles.

57,845. With the exception of Swansea Bay, are there many of these nets used?—There are one or two at Pentlow, upon the river at the estuary.

57,846. Is that outside Swansea Bay?—It is outside Swansea Bay. It is outside the land towards Carmarthen.

57,847. Is Swansea Bay the only bay well qualified for the use of these nets?—Yes, and there are a great number, because it is quiet; it is not subjected to storms, and it is a sandy bay adapted for driving down stakes.

The witness withdrew.

JENKIN JENKINS called and examined.

J. Jenkins.

57,848. (*Mr. Lefevre.*) How long have you been a fisherman at Mumbles?—I was born there.

57,849. How long have you been dredging then?—About 22 years.

57,850, Have you dredged for oysters, as well as trawled at other times of the year, during the close-season; or have you dredged only?—We were not allowed to dredge during the close-season.

57,851. Have you also trawled?—I have been trawling, but not for the last summer or two. There is not much fish.

57,852. Are you the owner of one of the boats lying off here?—Yes.

57,853. Have the number of boats increased at Mumbles of late years?—Yes.

57,854. Have they also increased in size?—They have increased in size, but not in number. 20 years there were as many boats as there are now, but they were all rowing boats.

57,855. All open boats?—Yes.

57,856. Ten or 12 years ago, did they begin to use the small skiff?—Yes, about 12 years ago.

57,857. They are those they now use?—Yes.

57,858. Boats of eight or 10 tons?—Yes.

57,859. Do they carry the same number of men?—No; one man less.

57,860. Is the number of fishermen then smaller than it used to be?—No.

57,861. Is it about the same?—About the same. There are not quite as many employed as there were. There are three men now in a boat where there were formerly four.

57,862. Do the boats bring in as many oysters now as they did formerly?—Yes, there is not much difference in that respect. There are many calm days when they cannot go out, when the rowing boats could go out formerly.

57,863. Then is the supply of oysters not greater than it used to be a few years ago?—No, there was more then than there is now. The old rowing boats were catching as many as they liked, but they could not get more than 5*s.* or 6*s.* a thousand for them then.

57,864. Have you observed any decrease in the oysters during the last four years?—Yes.

57,865. Are they not as plentiful?—No.

57,866. What is that owing to?—It is owing to so much dredging for them.

57,867. Do you think it is due to the over-dredging?—Yes, if they were not dredged so much there would be more oysters.

57,868. For the last four or five years, has there

SWANSEA.

J. Jenkins.

8 October 1864.

been a good spawn or spat?—There has been more than we have seen for a good many years.

57,869. During the last few years, have you observed the same?—No; last year there was not much spawn, but we have seen a good deal this season.

57,870. Then do you think the falling off is due at all to the want of spat?—No, I think it is owing to so much working upon the beds.

57,871. You told us that 12 years ago, when open boats were in use, you were able to catch as many as you do now?—Yes.

57,872. Then there was as much dredging then as now?—Yes, but we are out longer now. We were not in the habit of stopping out so long in the open boats as we do in the skiffs.

57,873. Do you fish over the same ground?—Yes, on the same ground.

57,874. You do not go further out?—Yes, we go further to the westward, off Worms Head.

57,875. And further off the shore?—Yes.

57,876. When you bring the oysters in, do you lay them out on the perches?—Yes.

57,877. And supply the market from them?—Yes, as they are wanted.

57,878. During the open-season do you lay in a large stock on those perches?—If we can sell them we do not lay them down. If there is any sale for them we send them away direct.

57,879. But if the market is over-supplied, you keep them here?—Yes.

57,880. And besides those perches you have plantation beds below the level of the water?—Yes, below ebb spring tide. That is a softer bottom.

57,881. What are those plantation beds for?—For keeping the oysters in the summer months, where they will fatten and feed; and there is no trouble in turning them over. They will gather sand if we do not turn them over once a week.

57,882. When you dredge up oysters in the bay, do you cull them at once?—Yes.

57,883. Do you throw over all under $2\frac{1}{2}$ inches?—Yes, that is the way we bring them in; you can see them lying on the beach.

57,884. They do bring in a certain number of small oysters?—Yes, a few that come in by chance.

57,885. When you lay them down on the perches, do you cull them again before you send them to the market?—Yes, we reckon them again, and if there are a few too small, we take them out to the plantation beds.

57,886. Besides that do you lay down a considerable number of large oysters on the plantations?—Yes, as we catch them.

57,887. Then at the close of the open-season you have a considerable stock on the plantations?—Yes, the merchants come there to buy them.

57,888. What is the difference in price in the close and the open-season?—We got 10*s.* last season, and from that up to 12*s.*, 14*s.*, and 16*s.*

57,889. During the close-season?—It was at 10*s.* before the season was out, and the price went up to 20*s.* in the close-season.

57,890. Do you always find an increased price in the close-season?—Yes, always.

57,891. That increased price is an inducement to the fishermen to lay them down in perches?—It is done to oblige the merchants, who depend on a stock all the year round; but if we could sell more oysters we should not keep any.

57,892. You would sooner sell them at once at a small price than store them up so that you may get a larger price, in the close-season?—Yes, because it would come to much about the same thing then. Sometimes vessels come in, and will steal 400, 500, or 1,000 in the course of a night.

57,893. Cannot you prevent them from dredging where the plantations are?—Yes.

57,894. Do they not dredge there?—No.

57,895. Do they send their men on shore in the night and take them?—Yes, they send their boats where the beds are, and take them.

57,896. Have you not sufficient protection for the plantations in the close-time?—No, it would not do for us to go out and watch.

57,897. Has each boat got its plantation ground?—Most of the boats have.

57,898. But notwithstanding that loss, you lay in a considerable stock to supply the market during the close-season?—Yes.

57,899. At the end of the open-season what supply do you think you have on the plantation beds, and in the perches?—It depends upon what sort of season we have had.

57,900. Taking an average season, what would there be?—Last season the London merchants came and bought cargoes, and took them away in their vessels; this year they could not take any at all, as the price was too high for them.

57,901. How many were there at the commencement of the close-time this year?—1,500,000 I should think.

57,902. Was that sufficient to supply the merchants who ordinarily buy here in the close-season?—No, they did not have many; the fishermen kept them back, and held on to have a few every week.

57,903. The difference in the price was about 8*s.* per 1,000?—No, they got up to 15*s.* and 16*s.* per 1,000 in the last week of the season. Then those who had them afterwards got 1*l.* for them.

57,904. What was the price at the close of the open-season?—15*s.* and 16*s.*

57,905. The price got up afterwards?—Yes, that is the highest price ever paid here; it was never so high before.

57,906. Do you recollect the oyster-fishing here before the close-time was established?—Yes, I recollect when the open-season lasted all the year round.

57,907. Did you fish all the year round?—Yes; but there was no market for the oysters then.

57,908. During the close-season?—No, we only sold a few about the town, a few now and then, perhaps one day's catch.

57,909. Do the oysters breed and spawn on the plantation grounds?—Yes.

57,910. Then the oysters you send away in the close-season are in a milky state?—Some may be. If you open them you may see milk in some of them; but there are some chance ones on the ground in April which are in a milky state.

57,911–2. Do you think on the whole that the enforcement of a close-time has done any good to the oyster-dredging here?—Yes, they would all have been fished out before this if we had kept at work all through the summer.

57,913. Before the close-time was enforced was the supply falling off?—No.

57,914. They dredged throughout the whole of the year?—That was before the skiffs came here.

57,915. But you told us that the open boats caught as much as the skiffs?—Yes; but the people had no market for them, and they were forced to knock off.

57,916. Then were there not many fishing then in the close-season?—No.

57,917. But a certain number did fish all the year round?—Yes, if they could sell their fish. Every man was his own merchant, and there were only four or five who were able to sell oysters.

57,918. If there was no close-time now, would dredging go on all the year round?—Yes.

57,919. Do you think that the oyster dredgers would fish grounds which they do not fish now if they were able to fish in the close-time?—I dare say they would find oysters all along.

57,920. Do you think they would fish upon new ground which they are not able to go upon now in consequence of the weather?—I do not know that they would; some might go out and look for oysters because the days would be longer, that would be one thing, but they would go generally where they thought they could get the most. There were a good many new patches found last season, and the ground on

which we dredge now is ten times as large as it was when I first went dredging.

57,921. Is this petition which you have placed in my hands one signed by the fishermen, and intended to be presented to the Fishery Commissioners ?—Yes.

57,922. Have you signed it yourself ?—Yes.

57,923. I think you said that you have been trawling, but not during the last two years ?—Yes.

57,924. Did you give it up on account of the decrease in the supply of fish ?—No, there never was much fish caught by trawling here on account of the weirs ; great quantities have perished in the weirs on the sand here.

57,925. Did you ever trawl when it was worth while ?—The trawling ground is on the other shore.

57,926. On the other side of the bay ?—Yes, in the east part of the bay where there is a fine soft bottom.

57,927. Are there no weirs there at all ?—No.

57,928. Do you think that the supply of fish has fallen off of late ?—Yes, they used to get plenty in the weirs, and did not know what to do with them.

57,929. Do you think that the weirs catch as many fish as they did ?—No ; but they have destroyed thousands.

57,930. Have the weirs been there ever since you can recollect ?—Yes.

57,931. Has the number of weirs fallen off ?—Yes.

57,932. Have you not in consequence found the supply of fish improving ?—No.

57,933. Has the supply of fish continued to fall off ?—Yes.

57,934. What number of weirs do you think there are in the bay ?—I cannot exactly say ; I daresay there are a dozen.

57,935. And besides the weirs, there are a considerable number of stop-nets ?—Yes.

57,936. In this petition you complain of the mesh of the stop-net ?—Yes, it is too small.

57,937. What is the general size of the mesh of the stop-net ?—From 1 to 1¼ inches. It is so small that you cannot put your finger into it, and nothing can get out of it.

57,938. What kind of small fish do they catch that you complain of ?—Small cod, bream, flukes, and small soles, herrings, sprats, and all sorts of fish.

57,939. Do the fish mesh themselves in the net ?—No, the stop-net ebbs dry. The sun kills them in the summer time, and the birds eat them up. Then there is what they call "cramming"; they take heath from the common and put it down, and lay stones on that to keep the water in.

57,940. Has the number of stop-nets increased of late years ?—There were none six years ago.

57,941. How many are there now ?—Six or eight.

57,942. Then as the weirs fall off in number the stop-nets seem to take their place ?—Yes ; the stop-nets catch more fish than the weirs.

57,943. Do the stop-nets catch more small fish than the weirs ?—Not as much I think ; small round fish have a chance of going out through the stop-net.

57,944. What number of boats trawl from Mumbles during the close-season ?—There were five last season, and there used to be eight or 10 in Swansea, besides the Brixham boats.

57,945. Do they trawl mainly off the shore here, or in Carmarthen Bay ?—It is only a chance time that they go there, these boats are too small for that ; they trawl in Oxwich Bay, and off here. There is a fine land for trawling off the weirs.

57,946. Do the trawlers take any considerable quantity of small fish themselves ?—No ; they do not bring in the fish that are too small to be sold.

57,947. Do they take up any quantity of small fish ?—In the trawl ?

57,948. Yes.—No, the mesh is too large.

57,949–50. What is the size of the mesh ?—The mesh in the trawl-net is, I daresay, about 3½ inches.

57,951. Is that when it is pulled out ?—Yes.

57,952. What is it in the cod of the net ?—It comes down to 1½ inches in the cod of the trawl.

57,953. That is three-quarters of an inch from knot to knot ?—Yes.

57,954. Are there any of those trawls now lying in the boats ?—No.

57,955. Can you show us one of them ?—I think I can ; they have a large mesh in the top of the net, but when it comes down it is only 1½ inches.

57,956. Is it only in the close-season that these vessels are engaged in trawling ?—Yes.

57,957. In the summer months ?—Yes.

57,958. Do they trawl mainly in the bay ?—Yes, in shallow water.

57,959. What is the depth of the water ?—They trawl off the weirs in the east part of the bay in from two to five fathoms of water.

57,960. What fish do they catch most of ?—Plaice, sole, and turbot sometimes.

57,961. And flounders ?—Yes, and hake and skate.

57,962. What are the smallest soles they bring to the market ?—It would take five or six of the smallest soles they bring to weigh a pound ; from the weirs it would take 20 to weigh a pound.

57,963. Five or six to the pound ?—Yes.

57,964. What is the length of a sole of which it would take five or six to weigh a pound ; would it be five or six inches ?—Yes, about that, about six inches ; they bring them in of that size.

57,965. Is there not a considerable quantity taken in the trawl of a smaller size than that which they throw overboard at once ?—Yes, sometimes. It is very seldom they come up very small in the trawl that they are not fit for the market.

57,966. Is there any line-fishing off here also ?—Yes, a good deal.

57,967. During the close-season ?—Yes ; sometimes a great many fish are caught, two or three dozen.

57,968. With the long-line or the hand-line ?—With the hand-line.

57,969. Is there any long-line fishing ?—There are no spilliards. They only fish over the side with a line held in the hand.

57,970. Is there any cod-fishing in the winter ?—No, there is no fishing in the winter, only for oysters.

57,971. Where do the trawlers bring in the fish ; do they bring them into Swansea ?—Yes.

57,972. Do you think the quantity they have brought in during the last two or three years is less than it used to be ?—It was rather scarcer last year than it was the year before.

57,973. In the year before that or in previous years had there been a falling off ?—I think there had been.

57,974. Has the number of boats employed in it fallen off ?—No, there are the same number. Boats come here from Brixham and Dartmouth.

57,975. Has the number of those boats fallen off ?—Yes ; there is no room for them to fish here.

57,976. Is there much ground here in the bay where they can trawl ?—No.

57,977. Will you point out on the map what ground there is for trawling ; is there ground on which you can trawl from White Oyster Ledge ?—There is nothing off that.

57,978. Is there no trawling ground outside ?—No, and no dredging ground. It is rough ground outside there.

57,979. Is it too rough for dredging for oysters ?—Yes, we have tried all up and down there, and there are none about the White Oyster Ledge.

57,980. Inside the White Oyster Ledge is there a trawling ground ?—There is ground all the way along for oysters.

57,981. Are there oysters on the Outer Green ground ?—Yes.

57,982. And the Inner Green ground ?—Yes ; there are oysters all along there.

57,983. Is there ground for trawling ?—Yes, not far from the shore.

SWANSEA.
J. Jenkins.
8 October 1864.

57,984. Is that the principal ground you trawl on?—No; up towards Port Talbot.

57,985. Do you trawl here?—Yes, there are a good many fish caught here inside the oysters altogether.

57,986. Then is it the opinion of the fishermen here that if the weirs were done away with trawling would increase, and there would be more fish for the trawlers to take?—Yes, and there would be plenty for the boats to catch with the hook and line. The small fish that are now destroyed would become large ones.

57,987. The oyster season here has already begun?—Yes.

57,988. Have you been taking as many oysters as you did formerly?—Yes, for the time we have been out. The weather has been very bad, and very much against us. It has been blowing very strongly all the time, and we have not been able to go down much where our best grounds are, away down off Oxwich.

57,989. When you have been able to go down have you brought as many away as in average seasons?—Yes, looking back to the last day of September, there was only a difference of 200 oysters caught in that month and in the previous September.

57,990. Have you kept return of your takes?—Yes.

57,991. What supply have you now laid down on the perches?—Not many now; they are going away as fast as they are caught. There is more sale for them than ever.

57,992. What is the price you are getting for them now?—12*s*.

57,993. Twelve shillings a thousand?—Yes, and there is more demand than there ever was.

57,994. How many have you got laid down in your own perch?—I have about 30,000 laid down there now.

57,995. Besides that you send off to the market every week?—I send off a good many.

57,996. What has the average per week been during the present season?—Some send 10,000 and 12,000, and on like that.

57,997. Do you think that during the present season you have sent off 10,000 a week?—Yes.

57,998. Are the men paid by shares?—Yes, by shares.

57,999. What share goes to the boat; one share?—More than one share; one-third.

58,000. A share and a third?—No; one-third.

58,001. One-third of the whole take?—Yes.

58,002. Do you divide the oysters?—No; each man gets 2*s*. 6*d*. a thousand, and the captain gets 3*s*., and the boat 4*s*. The boat takes one-third, be it what it may.

58,003. Do you separate the oysters?—No, they are all sold together in bulk.

58,004. Does each boat have its own perch, and keep oysters there?—Yes.

58,005-6. Do you make up your accounts at the end of the year?—Yes; I daresay the average would be 200,000 last year.

58,007. Two hundred thousand altogether?—Yes. In the dead of the winter, for about three months, there were not many caught. If we could not catch a little when we first go off, and in the last two months of the season, we should be very badly off.

58,008. Is there anybody to look after the oysters, and see that you do not bring them ashore too small?—Yes, the Coastguard.

58,009. They do exercise some control?—Yes.

58,010. Do they inspect the perches from time to time?—Yes, and if the captain can find a dozen oysters too small and under the proper size, he would seize the boat, and put us in prison for six months.

58,011. Have there been any seizures of that kind?—No, not one.

58,012. Then in your opinion do the fishermen observe the proper size?—They would be too small for the market. We cannot send them away less than the legal size. They would not go away if we brought them in. Perhaps a chance one may be brought in, but nothing more.

58,013. Are there many here from London who purchase oysters for laying down on other beds?—No, they take them away in their own vessels, and send them away to their own places.

58,014. They do lay them down in the Thames and elsewhere?—Yes; 13 cargoes went away in the spring of the year.

58,015. Were they all full-sized oysters?—No, young oysters.

58,016. What size were they?—They cannot take them less than two and a half inches. They may be three or three and a half inches, as long as they are young oysters.

58,017. Are the oysters they take fit for the market, and for eating?—They take oysters fit for the market.

58,018. But with regard to the oysters they take for the purpose of laying down, are they oysters ready for the market and fit for eating, or so small that they have to be laid down for fattening?—No, they are fit for eating, but they lay them down for August, and they grow and fatten.

58,019. Their object is to get a better price for the oysters during the close-season?—No, they take them from here to wait until the market opens. Then I believe they dredge them up again for the London market in the mouth of the river. There are two prices for oysters; we used to have for the small ones, which we called "knackers," 3*d*. a hundred, when they were plentiful years ago.

58,020. Is there a difference in the price now for the two sizes of oysters?—No.

58,021. Do you sell them of two sizes?—No.

58,022. Do you not sell a smaller class of oyster to the London people, who want them for laying down?—When they were here, and there were plenty of oysters, they wanted the small ones.

58,023. How long ago is that?—Ten years ago.

58,024. Have there not been purchasers here from London since then?—Yes; but the price got too high for them. The Liverpool merchants came here, but the price got too high.

58,025. Were oysters sold for that purpose every year until last year?—Yes.

The witness withdrew, and the inquiry was adjourned until the 4th of March 1865, at Whitstable.

Whitstable, Kent, Saturday, 4th March 1865.

PRESENT:

J. CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

WHITSTABLE.
J. H. Nichols.
4 March 1865.

JOHN HAMPTON NICHOLS called and examined.

58,026. (*Mr. Lefevre.*) You are foreman of the Whitstable Oyster Fishery Company, I believe?—I am.

58,027. When was the company incorporated?—In the year 1793.

58,028. Incorporated by a special Act of Parliament?—Yes.

58,029. Had there been an oyster fishery here before that time?—Yes, from time out of mind.

58,030. But the company at that time bought the

rights of some previous company, and were incorporated by an Act of Parliament, for the purpose of carrying on the business of an oyster fishery ?—Yes.

58,031. What was the number of men who formed the company at that time ?—I cannot say exactly. Some time further back than that, just before they purchased the rights you refer to, I believe they were only 36 in number.

58,032. Have they gradually increased in number from that time until now ?—Yes.

58,033. How many are there now ?—There are now about 400.

58,034. Is the mode in which the freemen of the company are elected provided for under the Act of Parliament ?—Yes.

58,035. Does each of the freemen have a boat of his own, or do the boats belong to the company ?—They belong to the company individually.

58,036. And do the widows of members of the company have any right to share in the profits of the company ?—Yes ; we always allow them a portion of whatever sum of money is divided in any shape or way, whether for work, or by way of bonus, or anything else.

58,037. How is the company governed ?—There is a foreman, a deputy foreman, and a jury of 12.

58,038. Are the jury chosen by the fishermen ?—No.

58,039–40. Who are they chosen by?—By the foreman, the deputy foreman, and the treasurer.

58,041. What is the number of boats you have at the present time belonging to the company ?—There are now 95 boats belonging to the company.

58,042. What is the size of the boats ?—They are of different sizes.

58,043–4. What is the average size?—They run from 10 tons up to 30 ; but generally speaking they are of about 14 tons.

58,045. How many men work in each?—There are generally three men in a boat. When they all go out, they go about three or four in each. Now that the number has increased, they will probably go four in a boat.

58,046. Does the number you gave me, 400, as the members composing the company, include only the fishermen who are working, or the widows as well ?—It includes the whole. There are, I believe, 408, including widows.

58,047. How many of the number are working men? —About 300. There are 300 who attend to the work. Then there are others who may be ill, and some who are disabled by infirmities, and sickness, and so on.

58,048. Do they receive any portion of the profits ? —Yes, they have their allowance given to them without going to the work. Parties who are able to attend to the work, work for those who are not able.

58,049. How is the admission of young men to the company regulated ?—By a water court attended by a steward.

58,050. Who has a right to become a member ?—Only sons of the freemen. Formerly it used to be otherwise, but when the number increased so much, the system was altered.

58,051. What is the extent of the ground belonging to the company ?—Barely two miles.

58,052. Two miles in each direction?—Two miles square barely.

58,053. Making four square miles ?—No, very little more than two. The whole of the ground is not used for laying down oysters. A great portion of it is taken up as a bay for boats.

58,054. Is all that ground fit for laying down with oysters ?—Not the whole of it, because we cannot use all of it. It might be made all fit for laying down oysters ; but in that case, we should have nowhere to put the boats. We must keep a bay for the boats.

58,055. With the exception of a bay for boats, where they lie at anchor, is all the rest of the ground fit for laying down oysters ?—Yes.

58,056. Besides the ground which is in the possession of the Whitstable Company, is there any other ground in the bay in the hands of other persons ?—There is, on the edges, viz., the west Sea Salter ground ; but that is rather smaller than ours.

58,057. I believe the Whitstable Company spend a great deal of money every year in purchasing oysters from a distance, and laying them down on this ground ? —Yes, they spend a great deal of money.

58,058. Besides that is there much oyster brood on the ground itself ; I mean the spat of the oysters which lie there ?—There has been a good deal of spat lying on the ground at times. When the weather is suitable, a great deal of spat falls.

58,059. Did you have any good spat last year ?—No.

58,060. When was the last time you had a good spat ?—The last time was in 1858. It fell very heavily on the ground then, but there has scarcely been any since.

58,061. There has been none since ?—There has been a little, just now and then, but no considerable quantity.

58,062. Do the company keep the regulations as to close-time ?— Yes, they are all under regulations. They receive orders from the foreman and jury as to what they shall do.

58,063. Do they observe the general law on the subject, or do they follow their own regulations with regard to close-time ?—The foreman and jury make regulations, and the company are obliged to work according to the orders they receive.

58,064. Do those regulations vary from time to time, or have they been the same for a number of years ?—There has been very little difference in them.

58,065. When does your close-time generally begin? —We hold our court in July, on the second Thursday in that month.

58,066. Is dredging for oysters permitted on the ground belonging to the company until that time ?—No, it is not permitted on our ground.

58,067. When do you leave off dredging for oysters? —We always leave off dredging for the market about the 9th of May. We never catch any for the market after that time until the 3d of August.

58,068–9. Do you not consider that the sections of the Convention Act between this country and France with regard to oysters operate upon your ground ?—I think it would be better for us to have the month of May for the spring season. We cannot do much with our stocks in February and March. The weather is very severe then, generally, and the boats cannot work in the deep sea.

58,070. But I understand that you go on dredging for oysters in the early part of the month of May ?—I believe there are three months in which dredging is prohibited, but there is a great deal of it carried on notwithstanding.

58,071. There are five months under the Act ?—I think it is only three, from May until September, or rather from the last day in April until the first of September.

58,072. That will be four months ?—Yes.

58,073. But I understand you to say that the company here permit oyster-dredging during the early part of May, notwithstanding that Act ?—We prohibit them from being sold ; we never sell any after the regular time until the 3d of August again.

58,074. You permit dredging to be carried on during the early part of May ?—That is only for the purpose of removing the stock, and selecting the full-grown oysters from those which are under-sized, for sale in the season. For instance, next May, when we have done selling oysters in the market, we shall begin to look over the stock, and shall select the full-grown oysters from the young ones in order to lay them on a bed by themselves. We leave the young to lie by themselves for the whole of the winter undisturbed.

58,075. During the open months are your men dredging over the whole of the ground belonging to the company ?—Not after we begin for the market season. We do not touch the ground on which the

WHITSTABLE.

J. H. Nichols.

4 March 1865.

young oysters are from that time, only now and then, just to watch it in order to see whether any vermin have got upon it. We only work upon the bed where the oysters are.

58,076. The oysters fit for market?—Yes.

58,077. Then your ground is divided into two parts?—Yes.

58,078. The market ground and the open ground?—Yes; we keep laying fresh stock on that portion of the ground which we do not use for sale in the market. We put oysters there during the whole of the season as long as we can buy any.

58,079. As long as you can buy them from outside?—Yes, from anywhere.

58,080. When the close season commences do you take up those oysters on the open ground, select the best oysters to lay upon the market ground, and supply the market from them in the open season?—Yes, we select oysters from the beds during the summer months.

58,081. You begin selling again on the 3d of August?—Yes; but it has long been my firm opinion that the work that is done between May or the early part of June, and from then on to August, in the selling of oysters, does a great deal of harm. Indeed I believe that that is the principal cause of the scarcity of brood in many parts. In my opinion the scarcity of brood has arisen in a great respect from that practice.

58,082–3. That is not the case with your oysters?—No.

58,084–5. At what time of the year do the oysters on the Whitstable ground spawn?—That depends in a great measure upon the character of the spring months of the year. If the spring sets in warm they will go off early in May, and sometimes under different circumstances they will not begin to spawn until June.

58,086. Then during that time, from the time the oysters begin to breed, you do not sell in the market at all?—No, we never do.

58,087. But you complain of others for doing so?—Yes, there are other parties who do it, and I think it is very wrong.

58,088. Do you conceive that you have power under your Act or Charter to sell during the whole year, or not?—Yes, we could do so if we chose.

58,089. Do you find that there is no demand for your oysters when once the spawning season has begun?—I do not know, but we would rather not do it; we believe it would be to our advantage not to do it.

58,090. Do the oysters breed on what you call the open ground?—Yes.

58,091. And do they also breed on the market ground?—Yes, they will breed anywhere wherever the spat may happen to fall, and where the ground happens to be clean.

58,092. Do you go on dredging the ground for the sake of sizing the oysters during the spawning season?—We do not go on dredging if we see any spawn on the ground. We generally see it as soon as it falls. We watch the oysters very closely in order to find out when they spawn. When we expect them to be spawning we carry out magnifying glasses with us, and when we can once get a sight of any spawn settled, we prohibit working on the ground directly, until the spat grows to a size so that we can handle it without destroying it.

58,093. How long do you consider it will take before that occurs?—A month will do it.

58,094. One month?—Yes.

58,095. Then do you conceive it to be a disadvantage to the oysters that there should be any dredging going on while the spat is still on the ground?—Yes, we do believe so. We leave off directly we see the spat.

58,096. What is the nature of the bottom of the sea here?—Shells, from the full-sized oyster-shells down to small pieces.

58,097. What is the nature of the ground itself; is it clay?—No, there is no clay except upon one small portion of it. In towards the shore it is generally what we call a shale, all broken shells ground as fine as dust nearly.

58,098. Is there sand below the shale or clay?—It is sand for a small depth, and then after that I believe it comes solid clay as hard and dry as this table.

58,099. Do you take any pains to clean the ground when the oysters are laid down?—It is our particular work from the month of May until June. We are employed then and constantly kept working over the whole of the ground to keep it clean.

58,100. Is that in order to prevent the settlement of mud?—To prevent the settlement of weed rather. Weeds are what we are mostly troubled with.

58,101. How do you work over the ground?—With the dredges.

58,102–3. But you do not take up the oysters?—We do not carry them away; we only simply take them up and collect the full-grown ones. We carry them away to the other bed and sometimes we throw them overboard; we save none of them. We merely haul them up and take away any rubbish there may be among them, such as five fingers, and any dead oysters; we carry them away from the ground.

58,104. Does the governing body of the company decide how much labour shall be employed in that way?—No, the jury do all that. They have the whole management of the beds.

58,105. Do they decide how many men shall be employed in cleaning the ground?—No, every man is at liberty to go and work if he is at home and wishes to go.

58,106. Do all receive the same amount; are all paid alike?—Yes.

58,107. Are the men paid wages?—It is according to circumstances; it is according to how the oysters are sold. They bring in a certain amount of money, and they divide out a certain portion of it, keeping the other part back for purchasing the brood of oysters from other places in order to lay upon the grounds.

58,108. The supply of spat on your own ground is not nearly sufficient to keep up your market supply of oysters?—No, we lay out many thousands of pounds in the purchase of oysters from Essex.

58,109. Is the spat you buy from Essex taken all over the estuary of the Thames down here and along the Essex coast?—No, it is taken from the rivers in Essex generally.

58,110. Do you buy the spat from what are called the flats?—Yes, that is the principal spot.

58,111. I see in the evidence which you gave before a Committee of the House of Commons last year, you gave a return of the quantity of spat the company have bought during the last few years?—Yes.

58,112. Does that include spat brought from all quarters or only from the flats?—I believe I gave evidence of the whole quantity of spat brought, so much from the flats and so much from Essex.

58,113. You say "the quantity of brood obtained "from the ground proposed to be taken for the new "fishery," referring to the Herne Bay fishery; does that mean the whole of the ground which goes under the name of the flats?—It means all the flats between the Spaniard and the shore.

58,114. What extent of ground is that?—It is a large extent.

58,115. Is it a much greater extent of ground than is taken by the New Fishery Company?—Yes, it is larger than that and wider.

58,116. Do you also buy oysters from other parts of the country besides Essex?—All between the North Foreland and here.

58,117. But not elsewhere?—And in Essex. When we go beyond the North Foreland we only get common oysters, deep-water oysters.

58,118. They do not produce as good an oyster as the native oyster?—No.

58,119. Have you got oysters from Ireland and the south coast of England?—Yes, there are some on the voyage now. We expect them in to-day.

58,120. Have you been obliged to purchase there in consequence of the falling off of the spat here during the last few years?—No, we have always got as many as we wanted from that source, but we lose

a great many in the passage from there to here. Sometimes a very great many are lost. We cannot get them home in time. But the common oysters are only a secondary consideration with us.

58,121. Your main object is, I presume, to supply the London market with native oysters?—Yes.

58,122. The Channel oysters and the Irish oysters do not produce as good an oyster as the native spat?—I do not suppose they do.

58,123. It is only when you cannot find a sufficient quantity of natives that you import spat from other quarters?—We generally lay down common oysters for use during the first two months of the season. By that means we can send a good quantity to the market during the early part of the season, say for about the first two months before the natives properly come in. We do not like to sell natives in the first part of the season. We consider that they have not got over their spawning sufficiently to make them good oysters for the market.

58,124. How long is it since you had a good spat upon your own ground?—Not since the year 1858.

58,125. Has there been a falling off in the spat from other quarters?—There has been a falling off, I believe, in the spat everywhere.

58,126. Since the same date?—Yes; there has been a falling off everywhere since 1858.

58,127. Has the spat been equally scarce on the Essex coast and on the flats?—Yes, it has been more scarce of late years than was ever known.

58,128. In consequence of that have you been obliged to pay larger sums for spat?—Yes, we are paying now four guineas for a bushel.

58,129. Will you supply the Commissioners with the return you gave to the Committee last year, and add to it the quantity of spat you bought last year, and what you paid for it?—I have not got that return with me, but I will supply you with it.

58,130. I see, in this return you say "quantity of "brood obtained from other sources," are they really native oysters?— Yes, all natives.

58,131. Does it not include any oysters brought from a distance?—No.

58,132. I think you said that you are obtaining a certain quantity from Ireland and the south coast?—Yes; from Ireland, Falmouth, and from Scotland.

58,133. Has the quantity you have obtained in that way been very large during the last year or two?—We have had something like 10,000 bushels from the several places, Ireland, Falmouth, and Scotland.

58,134. Is a wash the same as a bushel?—No, it is a quarter of a bushel, a London peck.

58,135. I believe when the company was originally started it had no capital?—No, it borrowed money.

58,136. The company borrowed capital on the security of their rights?—Yes.

58,137. What was the amount of capital borrowed at first?—20,000*l.*

58,138. Was that added to from time to time?—Yes, according to what was wanted, until it got as high as 30,000*l.* at one time. I believe that was in the year 1829. They made a large purchase in that year, and the amount of borrowed money was increased until it reached 30,000*l.*

58,139. Within the last few years have you been able to pay off that debt?—Yes.

58,140. And now you remain without any debt?—Yes, we are without any debt at present, and we are now working for our own money. Of course it is much better for us, and it will be better still if we can keep so.

58,141. How are the returns divided among the men eventually?—Do you mean through the year?

58,142. Yes.—Well, we send off the men belonging to the company to catch a certain quantity of oysters, and for each man so much money is allowed for the stint as we call it. Those parties who do not go out, such as those who are sick, have a small portion less than the men who do the work; and the widows receive one-third of what the men get.

58,143. Do the jurymen receive any more than the other men?—No.

58,144. Do you as the foreman?—No.

58,145. What have the shares amounted to lately?—I have taken the average for 18 years and it amounts to 23 shillings and some few pence.

58,146. Twenty-three shillings per week?—Yes, per week. The last three years it has been something better.

58,147. Have the profits been improving of late years in consequence of the high price of oysters?—It is not from that alone; the money divided among the men of late years has increased in consequence of our paying off our debt; instead of having to pay away our money to creditors, we have been enabled to divide it among ourselves.

58,148. In that average have you included any money given to the members of the company by way of bonus?—Last year each man received 16*l.* by way of bonus, and the year before 20*l.*

58,149. Have you included that in the estimate of the wages?—Yes, it is all included.

58,150. Do you include it in the estimate of 23 shillings a week?—Yes, but it will be more now. The last two years will add considerably to that amount.

58,151. What has it amounted to during the last two years?—Something like about 100*l.* in the course of the 12 months.

58,152. And during the last 15 years has the number of members been gradually increasing?—Yes.

58,153. Has the number greatly increased?—Yes, and it will go on increasing more now. Last year we added to our number 15 I think, and the year before 20. Then there are something like six or seven who die off in the course of a year.

58,154. Is there room upon your ground for all this increase of members?—We are quite enough in number now to fill up the ground we have. It would be much better for us if we could have a little more ground.

58,155. Have the members the right of nominating any number of their sons, or is there a limit?—Everyone, every son born.

58,156. Then as long as the society goes on in a flourishing condition, the number is likely to increase very largely?—Yes.

58,157. But there must be a limit to it, I suppose, some day or other?—We calculate that it is the oysters, the oysters do a great deal of it.

58,158. Is the whole time of the men employed upon the ground of the company?—No, they have a certain quantity of oysters to get, and sometimes they will not be more than half an hour about it; at other times they may be engaged for two hours. Then again in another season of the year they have to work the ground in order to cleanse it. Each man works upon that for four hours.

58,159. Do I understand that the men only work for about two hours a day in the open season, and four hours a day in the close season?—Yes, four hours a day in the close season when they are cultivating the oysters as we call it.

58,160. Then with that exception the rest of their time is at their own disposal?—Yes. We have sometimes worked for six hours, but as a general rule it is only four hours.

58,161. And you are only engaged for two hours during the open season?—I do not suppose that it will average more than that. Taking the whole season through that is about the time it occupies in catching the stint of oysters for the market.

58,162. Do the members work on the open ground as well as upon the Whitstable ground?—Yes, sometimes they have to get the greatest portion of their living from it. That was the case until within the last year or two.

58,163. Do they work four hours twice a day in the close season?—No, only once a day.

58,164. And only two hours once a day during the open season?—Yes. The dredging takes about two

WHITSTABLE.
J. H. Nichols.
4 March 1865.

hours, but there is in addition the time occupied in going and coming, which may take two hours more.

58,165. When the members are working outside the Whitstable ground, are they working for their own benefit or for the benefit of the company?—They are working then for their own benefit.

58,166. Do they sell the produce of their labour to the Whitstable Company?—Yes.

58,167. Then besides the 23*s.* a week which they have made on the average from the company they can make a good deal of money by what they call working outside?—Yes, sometimes they earn a good deal more outside than they get from the grounds. For some years that was the case regularly.

58,168. Are they entirely employed in dredging for oysters when they are working outside, or do they fish in any other way?—They catch various things, whelks, mussels, five-fingers, oysters, and oyster brood. All is fish that comes to the net when they go catching for themselves.

58,169. Is there any supply of full-grown oysters on the flats outside?—Yes, there are some of them that are very full grown and are very large, but they are in very small quantities.

58,170. Very small quantities only are to be found?—Yes, we could only get a few gallons in the day.

58,171. What the men find there mainly is the spat?—Yes, that has been their principal work of late years, but even that is worn out now.

58,172. There has not been much spat, you say, since 1858?—No.

58,173. What was the size of the spat they brought in?—From half an inch to an inch and a half.

58,174. Do you find those small oysters over a very large extent of ground?—They were found over a very large extent of ground at the time we had the spat.

58,175. If they were allowed to remain there, are you of opinion that they would have grown into big oysters?—No, they would all have been destroyed.

58,176. Why would they have been destroyed; what would have destroyed them?—They would have been destroyed by the vermin.

58,177. What makes you think that they would have been more destroyed when they grew up to be big oysters than when they were small?—They would not be destroyed when they became large oysters, but they would be destroyed more when they were small than large.

58,178. I understand you to say that previous to 1858 you found a considerable quantity of those small oysters on the ground, and that then they were destroyed by the vermin?—They would have to lie there for three or four years before they would grow to their full strength, and during that time a great deal of vermin would go among them and destroy them.

58,179. How long do you think it takes for an oyster to grow to half an inch?—It will do that in one summer.

58,180. In one summer?—Yes, if there is a good warm summer it will do it in one summer.

58,181. Do the Whitstable men go over to the Essex coast and dredge for spat there?—No.

58,182. Do they confine themselves to the flats?—They could go over to the Essex coast; but they confine themselves to the ground nearer home within our own limits. All they get is obtained between the North Foreland and here.

58,183. What time do they dredge for spat?—All the year round.

58,184. Then they do not observe any close season for that?—No, but the oysters got then are not fit for eating purposes. They only remove them from one ground to another. For instance, they will take them out of the water to-day from the flats, and deliver them to the company to-morrow, if they have weather to enable them to get the oysters into the water.

58,185. Then do not you consider that the Fishery Convention Act operates on this part of the coast with reference to dredging for young oysters?—I think not.

58,186. Why do you think it does not apply?—We have applied to the Board of Trade about the matter.

58,187. And they have granted you permission?—Yes. We have to obtain a licence.

58,188. To what extent of ground does the licence apply?—To ground within three miles from the shore, all within the limits of the port of Faversham.

58,189. (*Mr. Caird.*) You are not to dredge outside the three miles?—No.

58,190. (*Mr. Lefevre.*) Do the fishermen restrict themselves to that, or do they go outside?—Most of the work lies between that limit. There is not much to be done beyond the limit of three miles.

58,191. Is that the case also on the Essex coast?—On the Essex coast they do not go out so far. The oysters there lie pretty much near the land.

58,192. Have they a licence there to fish for spat in the close season?—I do not know; but we always do here every summer.

58,193. Do you pay anything to the Board of Trade for the licence?—No, we get it from the Customs.

58,194. Is it given to any man who likes to ask for it?—Yes, if any person wishes for a licence he goes and asks for it, and he can have it. But I take a licence for the whole of our boats. All the people who work for the Whitstable Company do it in a body instead of individually.

58,195. This dredging for spat goes on during the whole year?—Yes.

58,196. Is there a greater amount of it during the open months or not?—The summer months are the best for it when the ground is open.

58,197. What months do you say?—We may take it from May until October.

58,198. Why are they better months than the others?—The weather is warm, and the ground is loose. Although one might think that under water the weather would make no difference to the ground, that is not really the case. It is only as the weather is warm that the ground is loose, and we may then catch brood in a spot where we would not catch it at all in the winter. In the winter time the ground gets quite close and hard, and we cannot catch it at all.

58,199. I suppose that all the private beds in the mouth of the Thames are supplied in the same way?—Yes.

58,200. What would be the effect of carrying out the Convention Act, and preventing you from dredging for young oysters in the close months?—If we were prevented from working on the ground in the close months it would materially injure us no doubt. It is very possible that it might be the occasion of our losing a great portion of our oysters. There is no telling when the vermin would set in. Whenever a bed of five-fingers moves and settles itself upon the oysters, there they lie, and destroy everything before them unless they are removed.

58,201. What would be the effect of limiting the size of the oysters which you may dredge? What would be the effect of limiting the size to above two inches and a half in diameter?—If you were to do that there would be some native oysters that would never be sold, because they would never grow to that size.

58,202–3. Would it put a stop very much to your trade here?—I do not believe that it could be carried out at all.

58,204. Can you tell what proportion the oysters you bring from a distance bear to the oysters growing on your own ground?—No, we lay them all together.

58,205. Do you think the oysters grown on your own ground—the spat upon your own ground—bears any large proportion to that which you get from a distance?—No, we get the greatest portion from a distance.

58,206. Would it be a serious injury to you if you were not allowed to bring oysters from a distance,—say from Ireland and the south coast of England,—which are smaller than two inches and a half in

diameter ?—We do not want them small when we get them from a distance. If we go to Ireland to buy oysters we want oysters that we shall be able to sell off in the season before the winter comes. They will not stand the winter here.

58,207. Then what is the size you wish to obtain them ?—About two and a half or three inches.

58,208. You do not buy any large quantity of oysters from so great a distance as that of a smaller size ?—We do not buy any large quantity from a further distance than Arklow in Ireland.

58,209. What is the size of the oysters you get from Arklow ?—From two and a half to three inches in diameter.

58,210. Do you ever buy any from Falmouth ?—Yes, we have got some lying there now ready to send home.

58,211. What is the size of the oysters you get there ?—They are about the size of the native oyster. There is very little difference between them.

58,212. They are no larger at Falmouth than they are here ?—No.

58,213. Are they as large as two inches and a half in diameter that you bring from Falmouth ?—Yes, quite. We always take very great pains when we are working for the market ourselves to keep all undersized oysters back. It is of more benefit to us to have the oysters grown to a full size before we sell them.

58,214. What has been the lowest price of the native oyster within your recollection ?—The lowest price that I can remember ?

58,215. Yes.—Ten shillings a bushel.

58,216. What year was that ?—It was somewhere about 1822 or perhaps 1824. That was when I first began myself.

58,217. Can you supply us with a list of the prices of native oysters for the last 20 years ?—I daresay I can do so.

58,218. Has the price been greatly increasing since 1858 ?—Not until within the last five or six years. It has varied from 30*s.* to 40*s.* and 42*s.* That was all the difference in the variation until within the last four or five years.

58,219. Then has it been gradually increasing since? —Yes, it has been increasing every year since, first from 40*s.* to 50*s.*, then from 50*s.* to 60*s.*, and so on.

58,220. What is the price now ?—It is now as high as 90*s.*

58,221. Do you expect it will rise still higher ?—Very possibly next year it may be 100*s.*

58,222. Did you have any spat this last summer ? —Very little indeed. It was only here and there that I saw any.

58,223. Has there been any spat on the Essex coast ? —I believe there was a little at Burnham.

58,224. What is the reason that the spat has come to nothing ; can you form any idea of it ?—Our opinion is that the weather has not been suitable. We have not had for the last few years any warm nights. The days have been very hot, some of them, but the nights have been cold. We believe it is the temperature of the water. The nights have been so cold that they have not allowed the water to get a sufficient warmth to bring the spawn to perfection. That, however, is only our supposition. There is nothing else that we attribute the failure of the spat to.

58,225. Do you think the high price of oysters is really due to the absence of spat since 1858 ?—Yes.

58,226. And not to the falling off of the grounds, the consequence of over-fishing ?—No, it is not from over fishing, it is over market. The market would take more than we can catch.

58,227. What proportion does the price of the native oyster bear to other oysters—say the Channel oysters ?—That is no criterion. Persons can buy the native oysters at 90*s.*, and make a living and profit out of them, when they could not make a profit out of the Channel oysters at 12*s.*

58,228. What is the price now of the Channel oysters ?—The last time I was in London I went on board a boat there which was selling Channel oysters or Cheney Rock oysters at 13*s.*, and even at that low price the people who bought them could not make anything out of them.

58,229. When your oysters are selling at 40*s.* and 50*s.* a bushel, what is the price of the Channel oysters then ?—They would not fetch more than 6*s.* a bushel then.

58,230. Then the Channel oysters have also gone up in price, but not in anything like the same proportion that yours have ?—I suppose the native oysters rule the market generally ; if they are cheap they do not care to buy common ones scarcely at all ; but if they go up to an enormous price the buyers will take Channel oysters and common oysters.

58,231. The Channel oysters are much larger and coarser oysters ?—Yes, but there is no number of them in a bushel, and when they have got them they cannot sell them for less than a penny each. Thus they get very little for them, and in addition the Channel oysters are generally very coarse oysters.

58,232. Is there much ground besides the ground off Whitstable that is fit for converting into oyster-beds ?—At Faversham they have ground adjoining ours outside, and the Sea Salter ground is a very good ground.

58,233. What is the size of the Faversham ground? —Near about the size of ours.

58,234. Do they supply the market with as many oysters as you do ?—No, they do not speculate ; they only get what falls on their own beds, and that will not supply their trade.

58,235. Have you found any limit as to the quantity of oysters you can fatten for the market upon your ground ?—No.

58,236. Supposing you have a very good spat indeed and a vast quantity of brood on your own ground, and from other beds also, will they all come to perfection at the same time ?—Yes, all the same, no matter whether they fall on our ground or on the flats, all come to perfection at the same time.

58,237. They will all fatten to a certain point when they are laid on your ground ?—When they are laid down together they will fatten together. All will be alike, so that you will not be able to know one from the other.

58,238. Have you found any limit as to the quantity that will fatten when you lay them on the ground ?—No, all of them do about the same.

58,239. When you have a very good spat will it supply sufficient young oysters for three or four years, or do they all come to perfection about the same time and go off to the market ?—The best spat that ever fell on the ground that I remember, provided oysters for sale which lasted 11 years, including the spat that we obtained from the flats at the same time.

58,240. Were you enabled to extend the sale of them over so long a period by keeping them in stock, and only removing a certain portion to lay down on the fattening ground ?—We kept them generally on the ground and sorted out about half a mile. The ground which we selected for fattening ground would hardly be half a mile. We spread the spawn of the oysters and sold to the market from that. That would be sufficient to last the season.

58,241. Do you spread the oysters you intend to supply the market with rather thinner over the ground than those you keep on the store ground ?—No, we reckon them to lie as near as they can but they will not lie two or three one upon another. The thinner they are the better the oysters will do.

58,242. How long do you recollect the oyster-fishing here ?—About 50 years.

58,243. During that time, how many good spats have you had ; can you give me any information upon that point ?—No, I do not know that I can call to memory just now how many good spats we have had. I remember that we had one in 1818 and then another in 1822, and a third in 1827. It went on somewhat in that way.

58,244. At intervals of some years ?—Yes, there

WHITSTABLE.

J. H. Nichols.

4 March 1865.

was not a good spat every year, but there was generally five or six years between.

58,245. Have you often had five or six years when you have had no spat at all?—Yes, there have been some years when there has not been any to be seen.

58,246. During the 50 years with which you have been acquainted with the oyster-fishing here, have you often had an interval of five or six years when you have had no spat at all?—Yes, and there were 16 years once.

58,247. An interval of 16 years without any spat?—Yes.

58,248. Have you found the same difficulty in getting spat from a distance as in obtaining it here?—No, we could always get a supply from Essex in former years; we could always obtain from their grounds whatever we wanted.

58,249. Then has it been during the last five years that the Essex supply has failed for the first time?—We have had more brood from Essex, I should say, during the last 10 years, than was brought from there for 40 years before.

58,250. I understood you to say that the supply from Essex had fallen off during the last few years?—Yes; we cannot buy them there now, but formerly we could go there year after year, and buy 5,000 or 10,000 bushels in any year. Now this year I do not suppose we could buy two if we took with us all the money we could carry.

58,251. Do you think that the spat you find on what you call the flats, is the brood of the oysters lying on the Whitstable bed, or is it the produce of oysters lying scattered over the flats themselves?—It is more likely to be from the oyster-beds here, as there are only here and there oysters lying over the flats from which the brood could be obtained.

58,252. You think the spat you get from the flats has drifted out from the Whitstable beds?—Yes, out or in.

58,253. In looking at the chart of the ground, I see there is a spit of sand that stretches out from the shore close by Whitstable?—Yes, for a mile.

58,254. Do your beds lie mainly within that spit?—Yes, on the western side of it.

58,255. Have you any ground that lies outside of it?—Not to the eastward of it.

58,256. Then between that and the ground granted by Act of Parliament to the Herne Bay Company there is another space?—Yes.

58,257. And you are making an application to Parliament for a grant of that?—Yes.

58,258. Is it with a view of using it for fattening beds or to enable you to have the exclusive right of taking the spat there?—If we can get a grant of it we shall make the best use of it we can. If there is not sufficient room on our own ground to hold the quantity of brood we could get we should then put some there.

58,259. What do you value the property of the Whitstable Company at?—I can hardly answer that question.

58,260. Have they got a considerable stock of oysters?—Yes; we have got a very good stock, but it is lying over such an extent of ground that it would be a mere guess to say anything about the value of it.

58,261. You have been able to supply yourselves with spat for the last year or two, although at a considerably enhanced price?—Yes.

58,262. And I suppose you expect that the great increase of the price of the fat oysters will make up for it?—Whatever our oysters go at in the market, whether it is a high price or a low price, it rules the price of the brood we have to buy.

58,263. Do the Whitstable oysters fetch a better price than any of the other oysters about here?—I believe they do.

58,264. Can you tell what proportion of the supply of the market they form?—No; the oysters we send to the market are from all parts, they are all mixed up together, so that we do not know whether they are from the flats or from the Essex coast or where.

58,265. Can you give us a return of the quantity of oysters you supply every year to the market?—I can for the last few years.

58,266. Is there any great difference in the quantity you sell one year as compared with another?—Some years we sell a great many more than in others. Last year we sold about 20,000 bushels. The year before we sold very nearly 40,000. It has been about 20,000 bushels for some few years, and then down as low as 10,000 bushels.

58,267. Is there any regulation which you could recommend generally for the oyster-fishing, which in your opinion would be advisable?—Well, I do not know that I can say anything further than I have said respecting it. I believe if the oysters were not sold in the market for eating purposes in the close months, it is very possible that there might be more spat got than there is now. I recollect when I myself went as a boy to Jersey in 1816, that that year was the first year they went to work to the south of Jersey Island catching common oysters for companies here. There were seven or eight companies who were supplied year after year with those common oysters, up to within the last four or five years. Now there is not a single company that goes there. At the time I am speaking of they could always get plenty there. Some had 20,000 bushels, some 10,000, some as high as 30,000, to lay on their beds for stocking the ground; but after they began to work and to sell the oysters in the summer months, from that time the quantity began to decrease until they came down to none at all. I do not know whether that is the cause of the falling off or not, but at any rate it is in our opinion.

58,268. Were you in the habit, in those days, of laying down a considerable number of Jersey oysters?—Yes, a very great quantity.

58,269. Were they as good as the native oysters?—No, but they were the best common oysters we could get. They were superior oysters of the common sort.

58,270. Were they better than the Channel oysters?—Yes, they were worth three or four times as much as the Channel oysters.

58,271. Of what size did you buy the Jersey oysters?—They would run somewhere about four inches.

58,272. Did you buy the spat of those oysters?—No, it was full-grown oysters that we got.

58,273. Were they laid down for a few weeks here?—Yes, in the months of April and May.

58,274. You did not buy the spat?—No, nothing but full-grown oysters, and they were all sold off our beds again before Christmas.

58,275. Were you in the habit of buying the oysters during the close season?—No, not in the close months. We used to go there in the latter part of February and send the oysters home until the last day of April, then the season was shut up.

58,276. Then I understand you to say that you think that the selling of the oysters during the close months for the market was a bad thing?—I believe it was a bad thing.

58,277. Was it done with the Jersey oysters?—Yes, it was done with the Jersey oysters. It has been done ever since that time.

58,278. Were they brought here and laid down on beds?—Yes, they were brought across to Shoreham, Southampton, and other places, and sent from there into the market.

58,279. You are aware that for many years, oysters were allowed to be taken in Jersey during the whole of the year without reference to any close months?—It has only been for a few years that they have been sold during the close months. If they were taken in the close months, it was not for the market.

58,280. Are you aware that until five years ago oysters were allowed to be taken from the Jersey beds, and in the Channel generally, during the whole of the year?—Yes.

58,281. And that the close months have only been strictly observed during the last five years?—Yes;

companies would take them themselves for a certain time, then they would leave the island, and the Jersey boats would bring them across.

58,282. That was during what are now close months?—Yes; to Southampton and other places.

58,283. Then the enforcement of the close months has not done much good to the Jersey beds?—No, I believe not.

58,284. (*Mr. Caird.*) I think you stated that one objection you have at present is that some persons sell oysters during the close time; you consider that an injury is sustained in consequence of that?—Yes.

58,285. Who is it that does so?—They do.

58,286. Who or where?—They are what we call the local buyers, individuals who go into various places to buy oysters. They are not the companies, but some of the companies do sell them.

58,287. Is that from the beds in the Thames?—Yes, they do so at Milton and Queenborough, and send them into the London market.

58,288. Are the oysters they send native oysters?—They send all sorts, but principally common oysters.

58,289. In your experience, which has extended over a considerable number of years, have you found that you are able to supply a larger quantity of oysters in the year to the London market now than you did in former years?—Yes.

58,290. From your own company's beds?—Yes.

58,291. Is the quantity you are able to supply progressively increasing?—No, there is a decrease now.

58,292. What was the largest quantity you ever supplied to the London market?—40,000 bushels.

58,293. Of native oysters?—Yes.

58,294. What is the smallest quantity you have sent within the last 10 years?—Somewhere about 10,000 bushels.

58,295. You say the quantity is decreasing?—Yes, it is decreasing again now. 40,000 bushels were sent away a year or two back. Last year we sent only 20,000 bushels, and this year we shall not send quite so many.

58,296. Have the oyster-beds belonging to other parts as well as to the company increased in extent in recent years; has the cultivation of oysters as a matter of business increased?—We have not been able to buy or purchase so many oysters. The stocks have not been so large. The prices have gone up so much, and are now so high, that the trade will not take the quantity they did when they were cheaper. It is impossible for everybody to eat oysters now at the price.

58,297. The question I put to you is, whether you are aware that the number of oyster-beds cultivated as a matter of business is increasing within this district of the Thames?—No; the oyster companies have not increased. On the contrary, they have rather decreased. At Rochester the fishery has gone right out altogether. I believe that they have not laid any oysters down at Rochester for the last two years.

58,298. Was Rochester formerly a good place for oysters?—Yes, it was formerly considered the very first ground.

58,299. Had it been for many years a good oyster ground?—Yes, it had been very good for many years.

58,300. Has it ceased to be a good oyster ground now?—I don't know anything of it now. They have not been putting oysters upon the ground for the last two years.

58,301. Can you speak of your own knowledge of Rochester having ceased to be a ground for yielding oysters?—I know it does not yield oysters now. It hardly ever did yield any of itself. They were in the habit of getting their supply from other places; their brood was brought from other places.

58,302. And do they not any longer do that?—No.

58,303. Is that in consequence of the scarcity of spat?—No; I think they have failed somehow in their money matters, and they have broken up.

58,304. Has anybody else taken the business there?—No.

58,305. Have you observed in the course of years that the ground has become a better fishing ground? I mean that by constantly cultivating it, has the same ground improved in the course of years?—We believe that ours has improved.

WHITSTABLE
J. H. Nichols.
4 March 1865.

58,306. It has become a richer feeding ground?—Yes.

58,307. Do the oysters become of a better quality?—They do generally.

58,308. Do they sooner fatten?—Yes; every year now oysters are got very good, which formerly would not be good above once in six or seven years. They would not become a good fish regularly.

58,309. What is the cause of that; is the water richer for the oysters?—I cannot tell whether it is in consequence of the cultivation of the ground or not. We cultivate the ground more now than we did formerly, there being such a number of us. We can now work all over the ground in a week, whereas when I first went to sea we did not go to work in the summer months at all.

58,310. Do you think the feeding ground on which the oysters are fattened is much better for being worked over backwards and forwards?—Yes, I think it must be on account of the cultivation. I do not know any other cause for the improvement of the oysters. It is the same ground it always was.

58,311. Has the sewage or filth turned into the River Thames in any way influenced the feeding grounds?—It has had no influence upon our ground.

58,312. Not that you are aware of?—No.

58,313. Have you ever observed any change in the appearance of the water?—No, except in consequence of gales of wind.

58,314. You stated that you leave off fishing for the market at the beginning of May, and begin to catch oysters again on the 3rd of August?—Yes.

58,315. Do you begin to supply the market on the 3rd of August?—Yes, we send them to Billingsgate.

58,316. That is now in the close-time, is it not?—Yes, it is now in the close-time provided by the Convention between England and France, but we are not on that side of the land. It does not affect the oyster fisheries in Kent.

58,317. Then the oyster-fishing in Kent begins in the month of August?—Yes.

58,318. (*Mr. Lefevre.*) When the season first begins, I understand you to say that you do not supply the natives to the market, but only send oysters which you obtain from a distance?—Yes, there are just a few customers who want them, and the oysters we send are sent to supply them.

58,319. But what you supply are oysters from a distance; what you call Channel oysters or common oysters?—Yes.

58,320. (*Mr. Caird.*) I think you stated that the time for the spat was in May and June?—In June and July generally.

58,321. Have you noticed whether the common oysters which you bring in are as early in spatting as the native oysters?—Quite so.

58,322. Are they as good oysters for sale in the beginning of August as the natives are?—They are generally more fit and better for the market in the early part of the season than the natives are.

58,323. In the early part of the season, I suppose, the demand for the natives is not so good?—No.

58,324. It is not so good a season for selling them?—No, it is not.

58,325–6. Then do you reserve the natives, they being a better quality of fish, for the last part of the season?—Yes.

58,327. Is there any large proportion of the whole catch of oysters during the season that consists of common oysters?—No, only just for a month.

58,328. The first month?—Yes.

58,329. Then these common oysters you must have fished and brought from the sea, and placed on the ground during the previous close-time?—We get them from now until May.

58,330. You never allow them to lie longer than a

WHITSTABLE.

J. H. Nichols.

4 March 1865.

few months on the beds?—We begin now at this time, and we finish placing them upon the beds towards the latter part of April. We begin to sell them in August. We do not touch anything for the purpose of selling in the close months, either with regard to the common or the native oysters; nor do we buy any commons to lie down on the ground in the close months.

58,331. I think you stated that the common oysters would not stand the winter here?—No, the common oysters would not.

58,332. Have you any reason to give us for that?—Where we obtain them they are got out of deep water, and when they come here to lie in the shallow water, the frost and snow have so much effect upon the water and make it so piercing cold, that it kills them. The oysters are weakened very much in that way, and in addition gales of wind stir up the sand and frequently choke and disturb a considerable quantity of the oysters.

58,333. You find that you cannot keep them with advantage during the winter?—Yes, we have found that to be the case. Upon two occasions we tried it and failed. We obtained three cargoes from Wales on one occasion, and at another time we had two cargoes from Scotland. They were not exactly such fish as we wished for the market at that time, and our people here said, "Let them lie; we will keep them "there until next year, as they will not fetch anything "now. We will keep them until they will fetch more." We did keep them, and the winter killed every one of them. Whole boatloads were destroyed.

58,334. Were not the native oysters destroyed at the same time?—No, the weather will not kill them, they stand the winter.

58,335. What part of Scotland did you get the oysters from?—From Edinburgh, Leith, and thereabouts.

58,336. What time did you bring them in from Edinburgh and Leith?—About this time.

58,337. During the open fishing season?—Yes, they leave off on the last day of April.

58,338. From what part of Ireland did you obtain them?—From Arklow.

58,339. (*Mr. Lefevre.*) Do they lie upon your ground during the whole of the close season?—Where we push them over there they lie until we want them in August. After laying them down we do not disturb them while they are growing.

58,340. Do your own men during the close season go to fish for the brood of oysters?—Many of them do.

58,341. On the flats about here?—Yes.

58,342. You mentioned that you have sometimes paid four guineas a bushel for brood?—That is being paid now in Essex.

58,343. That is the price at present?—Yes.

58,344. For oysters obtained from the flats?—No, the price of oysters is not so high. The oysters from the flats are inferior now.

58,345. Is that price of four guineas paid to any person who has the right of selling oysters, or to the persons who catch them?—They are obtained from private grounds.

58,346. Then is the price paid to the proprietors of private grounds?—Yes, and it is also paid for oysters obtained from other parts of Essex, where everyone goes to work the same as we do here on the flats, and gets what he can. They are not, however, of quite so good a quality, and we only give 4*l.* a bushel for them.

58,347. In that case do the men who catch them get the money for themselves?—Yes.

58,348. That is chiefly done by your own men, is it not?—No, it is all done by Essex people. There are 300 or 400 of them engaged in it.

58,349. From what part of Essex do you get this brood?—From between Brightlingsea and Bradwell.

58,350. All up the rivers?—All round the island of Mersea.

58,351. Are there any got on the Maplin sands?—No.

58,352. Are there any oysters on these outside sands—the Maplin and Dengie flats?—No, I never saw any there; but I never saw an oyster on the sand at all.

58,353. At what age do you consider the native is fit to be sent to market; when is it in perfection?—We do not want to send them to the market when they are less than four years old.

58,354. Do I understand you to say that they grow to the size of half-an-inch in the course of a month?—Yes.

58,355. What size will they grow to in four months?—They grow very fast for two years. The first two years they grow a good deal more than the next two, and after the fourth year they grow very little at all.

58,356. Do they then improve in condition and fatness?—They grow thick after the fourth year and become deeper.

58,357. Do they become prime then?—Yes, after the fourth year. During the first two years they grow broad and thin.

58,358. Can you tell the age of an oyster after four years?—Not very well. Some people fancy that they can do so, but I do not think they can tell whether an oyster is six years old or eight.

58,359. Do they go on improving as they get older?—Not after six years of age. After that they begin to grow a shell at the heel. They get what we call open-heeled and the shell gets thicker.

58,360. Do you send the oysters to London by rail or by boats?—By boats.

58,361. Do you send the whole of them by boats?—Nearly all. Perhaps a few may go by rail.

58,362. Are there any other shell-fish found on this shore?—Yes, mussels and cockles.

58,363. Are they in great abundance?—Yes, there are plenty of them.

58,364. Are they fished for the market?—This year they have been very fine indeed.

58,365. Which, cockles or mussels?—Mussels.

58,366. Are they sent to the London market?—We only send very few away. We allow the poor people to go down on the shore and pick them up for food.

58,367. Is there any large quantity obtained?—Thousands of bushels.

58,368. Where are they sent to, to what market are they sent?—They sold about 500 or 600 bushels a short time ago to a person at Southend, who came down and bought them for laying down on the south shore.

58,369. Are they sold for food or bait?—For food.

58,370. Is that a trade that is increasing here or otherwise?—I should suppose that it increases, but there are many mussels now coming from Holland and other parts, which makes it worse for the parties hereabouts who have mussels themselves.

58,371. Does it lower the price?—Yes, they cannot get as good a price as they used to do, because the market is sometimes glutted with them.

58,372. Does the oyster fishery interfere with the mussel fishery, or the mussel fishery with the oyster fishery?—No.

58,373. The two do not come into contact?—No.

58,374. Does the cockle fishery interfere with the oyster fishery?—No.

58,375. I see there are fish weirs marked on this chart?—Yes.

58,376. For what object are they?—They are put there to catch plaice, herrings, and any fish that swim up and down that may get into them.

58,377. To whom do they belong?—To individuals along the coast. There is one at Sea Salter. I believe there are three weirs between this place and Faversham, but one of them is an old one.

58,378. Do they catch any salmon in them?—I never saw them take salmon.

58,379. Did you never see salmon caught in these weirs?—No, I have seen mackerel caught in them, and sometimes herrings and sprats.

58,380. Is there any shrimping carried on here?—Yes, there is a great deal of shrimping carried on here

sometimes, but there was very little last summer. There were only very few shrimps indeed got then.

58,381. Are there any sprats caught here?—There has been a good quantity of sprats caught here five or six miles off.

58,382. Do you allow the sprat fishers to come on your oyster-beds?—No, not on the oysters.

58,383. Do you not allow anything to pass over the oyster-beds?—No, nothing that would damage them.

58,384. Nothing that would in any way damage the bottom?—No.

58,385. That would be injurious to the fishery?—Yes, anything of great weight passing over them would injure the oysters.

58,386. Or anything that would pick up the oysters?—Yes.

58,387. It would do no harm to the oyster-bed if it did not disturb the oysters?—No, a net or a rope would not do any harm, but anything heavy or made of iron, or anything of that sort would.

58,388. You go over the oysters yourselves when you are cleaning them?—Yes.

58,389. Have you any difficulty in preventing people from dredging for oysters on your ground?—No, nobody comes here to attempt that at all, unless they do it in the dark, and we are not able to see them.

58,390. Of course you are a powerful body yourselves?—We should not do anything in the way of lynching anybody. We should not use any physical force, but if anybody came to take the oysters we should go through the proper forms.

58,391. Have you any powers under your Act to prosecute people for dredging upon your beds?—Yes.

58,392. How would you deal with them?—We should take them before the civil courts.

58,393. Does the Act give you power to do so?—Yes, we can appeal to any civil court in Kent.

58,394. I believe that until recently you claimed the right of preventing people from anchoring on the ground?—Yes, on the oyster beds.

58,395. Has that been decided in your favour or not?—The case that was decided was not in reference to the oysters. It was a piece of ground in the bay where we used formerly to dredge, but now since there have been so many ships coming here we have given up a certain portion of the ground, and allowed the ships to ride there upon receiving an acknowledgment of a shilling from them for the accommodation.

58,396. (*Mr. Caird.*) You watch the ground, I suppose?—Yes.

58,397. (*Mr. Lefevre.*) Do the mussels on the ground interfere with the oysters at all?—If we got mussels among the oysters, they would very soon smother them.

58,398. Do you take any means for destroying them?—I will tell you what means we did take. Some time ago a bed of mussels fell upon the oyster ground. It was some years ago, but still it was in my time. We set all our fleet of boats and every man we had to work in taking them up and destroying them when they were only as large as peas or beans; but with all the work we could do they grew faster than we could catch them. The result was that we could not reduce them at all. We then thought among ourselves, knowing that what we call "five-fingers" are as destructive to mussels as they are to oysters, that we had better go upon the flats and look out for a bed of "five-fingers," and put them on the mussels. While we were talking that matter over, some few "five-fingers" came in and settled on the mussels. They formed a bed, and very soon cleared out the whole of the mussels. By that means we got rid of the mussels. We could catch the "five-fingers," but not the mussels.

58,399. Although the "five-fingers" are enemies of the oysters, they are still greater enemies of the mussels?—Yes, they will eat mussels before oysters.

58,400. Then you keep the mussels down by using a certain number of "five-fingers"?—Yes, but the mussels do not often come upon the oyster-beds. That is the only occasion on which I remember their doing so.

58,401. Are you much troubled with "five-fingers"?—Not on the ground now.

58,402. You are constantly working to keep them off?—Yes, there is so much working upon the ground that they will not stop there after they get on.

58,403. Do you employ any labour besides that of the members of your company?—No, not upon our grounds.

58,404. Is it entirely confined to the sons of members?—Yes.

58,405. Do the widows remain members if they marry again?—If they marry away from the company, their right as widows goes with them.

58,406. I think you said that the oysters they find on the flats now are of a fair size?—Yes, there are large oysters there.

58,407. Are they good for the market?—They are good oysters, but they cannot be sold at first-rate prices.

58,408. They will not fetch so good a price in the market as your fattened oysters?—No.

58,409. But still they do fetch a price in the market?—Yes, they are a good second oyster.

58,410. Are they found in any number?—No, only in very small quantities.

58,411. Are they found for any great distance over all this ground that I see marked on the chart; is there much ground besides the Whitstable ground fit for enclosing and converting into private property for the purpose of oyster-fishing?—It does not appear like it. It is nearly all so much clay ground.

58,412. Parliament has already granted a considerable extent of ground to the Herne Bay Company?—Yes.

58,413. If Parliament were to proceed in the same direction, and to make grants to other people, what would be the effect upon the trade here?—It would cost a deal of money to bring the ground into cultivation.

58,414. Would it in any way interfere with the supply of spat to the different companies which are now in existence?—Yes, it would interfere with us in this way. For instance, if any portion of the brood was to fall upon the Herne Bay ground now we should get none of it.

58,415. Suppose Parliament were to make grants of a greater portion of the foreshores in the estuary of the Thames to different companies for the purpose of converting them into private oyster-beds like yours, do you think it would interfere with your business?—It would interfere with the interests of the public generally. The oyster-beds would not be so good.

58,416. In what respect?—I do not think they would be so good.

58,417. Do you think it is better that all this ground should be left open?—I believe that we shall get a better supply from it as long as it is left open.

58,418. The only supply which you get from it at present is the small oysters and the spat?—It is all of it taken to our grounds, and nursed, and brought to perfection.

58,419. But if this ground were converted into a private ground, you would still have the spat falling upon it?—Yes.

58,420. It would then become the property of the persons on whose ground it fell?—Yes.

58,421. And the consequence would be that you would not get so much of it without paying for it?—It would not do so well for us.

58,422. (*Mr. Caird.*) Is the shore, and other parts of the ground along here not so well fitted for the cultivation of oysters as your ground?—It is not so well fitted for the cultivation of oysters at present. It would require a good deal of attention to be paid to it, in preparing it, and rendering it fit, if indeed it could be made fit at all.

58,423. I think you stated that a sandy bottom is quite unfit for the cultivation of oysters?—Yes; sand is quite unfit for the cultivation of oysters.

WHITSTABLE.

J. H. Nichols.

4 March 1865.

58,424. Is a clay bottom also unfit for the cultivation of oysters?—No; the only thing about clay is that you hardly ever find good fish if they have been lying on clay.

58,425. What is the cause of that?—I do not know from what cause that arises.

58,426. (*Mr. Lefevre.*) Do you ever find the young spat there?—Yes; but when we find it upon clay we have it taken away and placed upon our own ground, so that it may be cultivated.

58,427. Is there not every reason to suppose that the spat deposited there, and which you remove in that way, would grow up and become large oysters?—Yes, it would do so, if it was not destroyed before it had time to become large.

58,428. Do you mean that it is destroyed by vermin or carried away?—It is both destroyed by vermin and carried away.

58,429. Does not the spat lie upon shingle?—Yes; it will lie upon anything that is clean to receive it, either shells or little stones, or large stones, or anything of that sort.

58,430. When your men are dredging on the flats for spat, do they carry away everything?—No.

58,431. Do they throw the stones back again?—They pull up the stones with the spat attached to them. They pick out the brood and throw the stones back again.

58,432. Has there not for some years been a trade carried on here, in dredging up stones for cement?—Yes, there have been thousands of tons dredged up on these flats, between Herne Bay and this place, by thousands of people.

58,433. Are they stones to which spat has been found adhering?—No.

58,434. Then that has not done any injury to the oysters?—No.

58,435. Has it made no difference to the oyster ground?—No, the oysters generally fall better upon small stones or shells.

58,436. What other beds are there besides the Faversham bed and the Rochester bed on the south side?—Do you mean the south side of the Isle of Sheppey?

58,437. No, south of the Thames?—They are all on the south side, except those in the Lea.

58,438. What beds are those?—The Cheney Rock bed is one.

58,439. Does it belong to a company?—No.

The witness withdrew.

S. Kemp.

STEPHEN KEMP called and examined.

58,440. (*Mr. Lefevre.*) Are you an oyster dredger in Whitstable?—Yes.

58,441. Are you a member of the Whitstable Company?—Yes.

58,442. How long have you been a member of the company?—Ever since I was 17 years of age.

58,443. Do you agree with all the foreman of the company has told us?—I agree pretty much in what he has said, but I think there are several things which might have been stated to you a little more clearly.

58,444. Can you mention any point to us in which you differ from the statements which have been made by Mr. Nichols?—I am not aware at this moment of anything very essential. With respect to the brood, it appears to me to be the object of the commissioners to ascertain what means can be taken for preventing the oysters from becoming extinct; or to create a larger supply than can be obtained at present. Much has been said about the flats, or the oyster brood obtained on the flats, and likewise from Essex. We have stored our grounds principally from the flats and from Essex, and until late years our young men were able to earn a great deal more money by going upon the flats and catching the brood, than in working upon their own ground. The spawn very frequently falls upon the flats. You have asked what is the cause of the brood falling, and you have also asked how the oysters spawn. Now that used to be a great mystery to almost everyone. We have watched the oysters in the summer, when the spat has been falling, and we have found that that operation has generally taken place in very hot, still, sultry weather, and particularly we have noticed that it has taken place on warm nights.

58,445. (*Mr. Caird.*) That is what the previous witness told us?—Yes, he told you that in effect. When the spat falls, it comes upon the surface of the water. It does not grow upon the surface, but it is driven about by the tide until it assumes a certain consistency, and it then settles itself upon any suitable object that may present itself. If there is a favourable bottom, such as stones or shells, or things of that sort, it will adhere, and grow, but if not it becomes destroyed.

58,446. (*Mr. Lefevre.*) Will you point out on the chart what you call the flats, and explain what the extent of ground is?—What we call the flats extends from the sands to the shore.

58,447. (*Mr. Caird.*) Close inshore?—Yes, from the Spaniard buoy to the shore. With regard to the brood obtained from a distance, there are very many persons who have an idea, that the brood by being brought here, and laid down on our own oyster ground, become natives. They think that, let it come from where it will, if it is only laid down on the flats for a certain length of time its character changes, and it grows into natives. That is altogether a wrong impression. It will do no such thing. If it is not destroyed by vermin it would grow into large oysters, quite out of proportion as compared with natives, and would really become common oysters.

58,448. Would any brood got upon your side of the river or upon the Essex side become natives?—I cannot answer for the Essex side of the river, but that which is got on our side certainly would not become natives. The principal part would not, but would become large overgrown oysters.

58,449. (*Mr. Lefevre.*) That would be the result if it were left on the flats?—Yes, provided that it escaped its enemies, which are legion.

58,450. Do you think the native character of the oyster is due to its cultivation?—Certainly I do.

58,451. From the place in which it is deposited and laid down on your beds, and where it fattens?—Yes; but it must be deposited on a certain place on these grounds, or upon the Essex coast.

58,452. Then a young oyster on the flats, if it remained in its native place, would not become a native?—No.

58,453. But when transferred to your beds it would?—Yes.

58,454. Is it also the case with regard to the oysters which are brought from a distance, from Ireland for instance?—No.

58,455. The brood, after being laid on your beds, is converted into native oysters, is it not?—No, that is not so. The public think it is so, but it is not the case. They have an idea that by making an oyster-bed at Herne Bay, and bringing spat from Scotland and Ireland to stock it, they will produce native oysters; but it is no such thing. On the contrary, all they will do will be to take these flats away, and they will be likely to produce a contrary effect, by limiting the supply of brood, and causing native oysters to be dearer.

58,456. Can you tell me the extent of ground on which you are able to fish for spat upon these flats?—The ground will be about eight or nine miles in extent.

58,457. Eight or nine miles, by what in width?—Say three miles.

58,458. Three miles broad?—Yes, in a rough estimate.

58,459. What makes you think that the spat never

comes to perfection on the ground?—We have evidence of that.

58,460. What evidence have you?—All the brood that is left there becomes overgrown.

58,461. Yes; but it grows up to be large oysters in the end?—It would never have substance enough. Those oysters, if they were left there for two or three years, would not gather substance, but would continue growing.

58,462. Upon being removed to your beds do they fatten and become better?—Yes.

58,463. I presume, that if they were left upon the ground, they would fatten and come to the market, but that they would not be so good as your native oysters?—Yes.

58,464. Then you do not agree that they would fall victims to five-fingers and other vermin?—Yes, I think they would. I say they would grow large, provided they escaped the vermin. Our system of doing business is to buy all the brood we can buy of everyone who offers it, and to give the market price for it.

58,465. Can you recollect the time when all over the flats there was a considerable supply of large oysters as well as of brood?—There was never any great quantity of large oysters. I have hardly ever known them able to catch what we call a London bushel, perhaps they may have got a small quantity when they have been catching whelks.

58,466. Do you not think it possible that the failure of the spat is due to an insufficient number of oysters being left on the flats for the supply of brood?—I do not think that is the cause of it.

58,467. You think the brood that does now grow upon the flats is deposited there by the oysters lying at Whitstable, and not from the oysters left there?—We are inclined to think so.

58,468. You believe that the spat that does fall there comes from the private beds inshore?—Yes, that is our opinion.

58,469. Do you think it possible that the flats may have been over fished, and that there is no brood there, because there is no supply of oysters to spawn there?—There are no oysters on the flats to speak of now.

58,470. Do you think there can be no spat, unless it happens to drift away from your own beds?—Yes, I will try to illustrate what I mean by the Faversham beds, to the east end, as we call it. They are hardly ever without a spat of brood. Whenever the spat falls it is sure to be at the east end. Those beds are situated to the north-east corner of our ground. The tide runs in an eddy for a considerable time, both ebb and flood, and during the eddy, the brood swings about, and a portion of it falls, I think.

58,471. But the tide may carry it away to a place where it cannot do any good?—Yes, all along the shore, as it has done frequently.

58,472. Do you not think it possible, that by constantly fishing upon these flats, you have denuded the beds of large oysters, so that there are now no oysters to provide natural spat for the ground itself, and requiring the ground to rely upon the casual spat which is drifted upon it by the tide from the private beds?—I think it is much better to take care of the brood when young, than to let it take its chance and be killed.

58,473. Where the flats are most worked, do you find most brood?—We can account for that. It is because the soil is cleaner.

58,474. But is it so?—Yes, it is so, although we have a great spat of brood very seldom, there is generally, if I may so term it, a limited supply afterwards. For instance, for a year or two after a heavy fall of spat, a small quantity of brood falls in the season.

58,475. (*Mr. Caird.*) After a good spat year?—Yes.

58,476. Where do you suppose the spat comes from? From what place does it find its way to the flats?—My opinion is, that it drifts from the oysters on our beds. As I have said, it then acquires a certain consistency, and falls. You may see it with a microscope.

58,477. The small oyster?—Yes.

58,478. Have you ever yourself examined the spat?—Yes.

58,479. Where do you suppose it comes from?—From the oyster itself.

58,480. But from what particular part of the coast do you think it comes from? Does it come from your cultivated beds?—Wherever there are most oysters, there is likely to be most spat; and our beds are always replenished with oysters.

58,481. Is there not a good place for spat off Herne Bay, and is there at present any cultivated bed near that?—No, at present there is no cultivated bed near that.

58,482. But is there not brood to be found there?—I have known when there was none along the shore to speak of, and when it has been covered with it at other times. At times it has been carried all along the shore for miles. That, however, is according to the way in which the tide carries it.

58,483. Then, according to your experience, the quantity of brood does not depend on the quantity of mother oysters lying upon the ground?—No, oysters are so prolific that they will produce a great deal of spat, if the season is favourable for it. Perhaps I may be allowed to say, that there is some difference of opinion among the fishermen as to what constitutes the brood. When I was a young man, I had an idea that the spawn of the oyster was not the brood.

58,484. (*Mr. Lefevre.*) Do you think that there would have been a better spawn in the last few years if there had been more large oysters left on the ground which you call the flats?—No, I do not think so.

58,485. Have they been so cleaned off the ground, that at present there are no parent oysters on the ground at all?—No, that is not the cause of it. I believe the sole cause is the want of suitable weather. There is always brood every year, if the weather is favourable for its preservation. I told you just now that when I was young I had an idea that the spawn of oysters was not the brood; but after the most strict investigation, I have come to the conclusion that the spat is the brood. We have it every year, but the last year in which we had it when it was successful was in intense hot weather. I never knew it hotter than it was for some days in that season.

58,486. And it resulted in a satisfactory spat?—It did.

58,487. What was the year you refer to?—It was in 1858. There was no spat last year worth speaking of. There was only a bit here and there.

58,488. Have you sometimes had a good spat for three or four years running?—Occasionally there has been spat for as many as three or four years running. But, generally speaking, the first year is the best.

58,489. When do you think that the oysters begin to breed? At what age are they when they spawn?—We find them sick as soon as the warm weather comes on. The reason why, when I was young, I fancied the spawn was the spat, was that I have frequently killed brood with what we call the milk in them.

58,490. Of what size would they be?—Not much larger than an inch and a half across.

58,491. What age would they be?—They would not be more than two years old. It was a long time before I could divest my mind of the impression that these oysters had not arrived at sufficient perfection to enable them to breed.

The witness withdrew.

EDWARD JOHNSON called and examined.

58,492. (*Mr. Lefevre.*) I believe you can give us some information as to the ground on which the brood of the oysters is found here?—Yes. Here (*pointing to the chart*), in what is called Whitstable Street, is where our ground is enclosed. The last time we had a good spat of brood, as you have already been told, was in 1858. That fell all in the fish weirs and away down along the beach in the Copperas Channel, at Cliff End, and underneath the Hook Spit and the Gore. All along there was covered with the young brood.

58,493. (*Mr. Caird.*) That was in 1858?—Yes.

58,494. That was a very good year for spat, and was the last favourable year you had?—Yes, both in 1858 and 1859 the spat fell in the places I have mentioned, and extended right down as far as Margate. I believe that oysters were caught after that fall of spat right down the South Channel.

58,495. Do you think that the whole of that spat came from the oysters upon your beds?—Yes, that was our opinion. There were no other oysters upon the ground from which it could have come.

58,496. Was it carried down from your beds by the tide, and deposited in the places you have mentioned?—Yes.

58,497. (*Mr. Lefevre.*) In other years upon what part of the flats did you find the spat?—Sometimes we have found it out here by the Pansand ground and down through the gat ways over by Spaniard Sound.

58,498. Have you observed that it falls in any particular depth of water?—No, I have not observed that. It has been found all over these places in the channels.

58,499. It has not been found in the main channel?—No, not in Prince's Channel or in Queen's Channel, because the water is deeper there, but it is found in different parts of the small channels which are formed under the lee sand.

58,500. Is it found between the main channel and the sand?—Yes.

58,501. Upon what kind of ground have you generally observed it?—Principally upon ground formed of sand and shells.

58,502. Are they found on sand?—It is a peculiar sort of sand.

58,503. You do not mean fine sand?—No, it is not a sand like that upon the Maplin sands for instance. No oysters would live there, but it is a sort of sand with blue clay mixed with it.

58,504. Not stiff clay?—No, it is blue clay; a kind of slubby clay.

58,505. Does the spat adhere to stones and shells at the bottom?—Yes, but in places up here by the Pollard there is rather a shifting soil, which is slubby, muddy, and soft. It sometimes comes down and covers the oysters so that they cannot be laid down there on that part of the coast.

58,506. (*Mr. Caird.*) Is the whole of the ground capable of being covered with oysters?—No, all along this part (*pointing to the chart*) there is a great deal of copperas stone. Wherever that is we find that the oysters do not succeed so well as in other places. They become stunted in their growth and the shells get full of little worm holes.

58,507. They do not grow there very well?—No.

58,508. Is that upon the ground recently given to the Herne Bay Company?—Yes.

58,509. Further down, how is it?—I should say that it is the same here (*pointing to the chart*) down the Gore Channel.

58,510. Are there not oysters at present laid there and cultivated?—No, but there are oysters there which are uncultivated.

58,511. They are not taken care of in the same way that the oysters on the ground off Whitstable are?—No. When the fishermen go down there to catch whelks they catch oysters at the same time. The oysters there grow up large fat oysters.

58,512. They do not become natives?—No, not a bit of it. They are the worst sort of oysters we ever get.

58,513. Where are they obtained?—Upon the Pansand ground.

58,514. Are there any oyster-beds cultivated about the Isle of Sheppey?—No.

58,515. Is not the ground there suitable?—No, but up above there is suitable ground.

58,516. Are the oysters found upon that ground much of the same kind as those at Whitstable?—I cannot say. I do not know anything of them at all.

58,517. Is there anything on this part of the ground (*pointing to the chart*) that is likely to prove disadvantageous to the cultivation of oysters?—I cannot say. It is principally yellow clay, I believe.

58,518. What, in your opinion, is the best description of ground on which to establish an oyster-bed?—That is a very difficult matter to say. You require a little piece of ground, and you want to have it placed in a right situation.

58,519. What should be the situation?—It should be near the mouth of a river where the fresh water and the salt water join. It should also be in such a position that you can work it continuously and keep it clean. Then, again, it is necessary that it should be sheltered as much as possible from heavy seas. Heavy seas rolling in upon the oyster-beds would do them a considerable amount of injury.

58,520. Should the ground itself be gravelly clay or sandy?—A composition of blue clay and sand is good ground for the oysters.

58,521. Without stones?—Shells are very good for the brood to fall on. Of course it is necessary to have a proper bottom before you can cultivate an oyster.

58,522. Are your oyster-beds always covered at low water?—Yes, they are always covered at low water.

58,523. Is that necessary for breeding-beds?—Yes, I think it is absolutely necessary.

58,524. It must never be quite bare of water?—No.

58,525. For what reason?—Because in the winter the frost would kill the oysters.

58,526. Then the tide never leaves your oyster-beds?—We have occasionally had very extraordinary tides when the whole of the shores have been left dry. But that only happens once or so in the course of 20 years.

58,527. Has no damage been done to the beds in consequence?—No, because it did not happen to be frosty weather. If it had been freezing hard at the time or snowing the oysters would have been injured.

58,528. What depth of water is there upon the beds at low water and high water?—I believe the soundings are all marked upon the chart. The depth varies from four feet to five feet and seven feet.

58,529. Then are the whole of your oysters, as a rule, from four to six feet under water at the time of low water?—Yes, in ordinary spring tides. Perhaps in extraordinary spring tides there would not be more than three feet of water over them.

58,530. Is the ground to the west of this as well adapted for oysters as your ground?—I think so, but it is shoaler water.

58,531. It has the other advantages of a mixture of fresh and salt water which your ground possesses?—Yes.

58,532. Your ground is equally good for feeding as for breeding oysters?—Yes. There is a very remarkable thing in connexion with our ground which I will mention. Our people can go off after oysters in a fog, and they will be able to tell where they are by the description of oysters they dredge up.

58,533. They can tell that from the appearance of the oyster itself?—Yes.

58,534. Your oysters here are considered very good?—Yes, there are no better oysters grown than those we get down here.

58,535. Do you agree with the opinion which has been expressed to us by another witness, that oysters will not become natives, unless they are placed upon

such a bed as you have here?—Do you mean our oysters?

58,536. What I mean is this, are you of opinion that oysters taken even from the Essex coast, if left on the flats instead of being cultivated on your beds, are a different description of oyster when they come to the market from those which are placed on your cultivated beds?—Yes, quite different.

58,537. Are you able to say what is the cause of that?—I suppose it is occasioned by the cultivation which the oysters get after they are placed on our beds.

58,538. Do you suppose that there is anything in the character of the deep water towards the centre of the river, as compared with what it is here in the estuary of the smaller river, which in the one case leads to the production of a coarser description of oyster, and in other of a finer?—I do not think that there is anything in the character of the water to cause the difference. I think it is rather in the character of the soil. The same water, it is evident, must flow over the oysters there as here.

58,539. Is the difference so great within half a mile of the oyster-beds?—Yes, even on our little piece of ground here we can go off, as I told you just now, on a foggy day and heave out the dredge and tell where we are from the description of oyster we take up.

58,540. I suppose that the oysters you might dredge up of a different description from those on the regularly cultivated beds would be good oysters?—Yes, but you can see a difference in the growth of the oysters.

58,541. Upon which part of the ground do the oysters grow best?—They grow faster about here (*pointing to the chart*). They grow larger and faster.

58,542. If you were to form an oyster-bed to the eastward of this, further to sea, and work it in the same way as the Whitstable beds, could you not get native oysters there also?—I do not think we could. That ground is well worked now and always has been.

58,543. Then it is not the working upon the ground that has anything to do with the production of native oysters?—I believe that the working upon a bed of oysters improves them very much indeed.

58,544. But is there not something in the nature of the ground itself?—Yes, to begin with, and no working in the world would make native oysters of the oysters that grow down there. That is where the copperas stones are.

58,545. Over what extent of the bed of the Thames do you obtain a supply of native oysters for the London market?—There are no native oysters sold from anywhere except the companies' grounds. There are our company, the Queenborough Company, the Faversham Company, and the Rochester Company, but they do not sell any now, I think. Then there is the Sea Salter Company; the Pollard ground is where they send from, and they do not send away many now. A good many are also sent over from Essex. In point of fact, that is where the principal part of the native oysters come from.

58,546. Then the native oysters are found on both sides of the river; both on the Essex coast and the Kent coast?—Yes, decidedly.

58,547. But they are confined to certain small localities on both sides of the river?—Yes.

58,548. Is that dependent upon the character of the soil upon which the spat is deposited, and upon there being a mixture of fresh and salt water?—I believe it is dependent both upon the soil and upon a mixture of salt and fresh water. The nearer you get to the Thames the better the oysters are on both sides of the river. Those obtained from Burnham are far better than those obtained further down on the coast.

58,549. Are the oysters better at Sheerness than at Whitstable?—No, I think not.

58,550. That is further up the Thames?—Yes, but we have the Swale which comes down here as well as the Thames, and there is not the same favourable kind of soil at Sheerness.

58,551. Is there any extensive ground on which native oysters could be cultivated which is now unoccupied?—Yes, a large extent of ground.

58,552. Is there any ground still unoccupied which might be advantageously cultivated with oysters?—Yes, this piece here (*pointing to the chart*) might be cultivated, or at any rate some parts of it.

58,553. Has the culture of oysters been extending within your experience?—Yes, I think so, decidedly.

58,554. Then is the supply at present larger than it used to be 20 years ago?—No, on the contrary, I think it is less than it has been within recent years. Perhaps, speaking of 20 years ago, it may be larger than it was then.

58,555. Are there not more capital and more labour applied to it now than there were 20 years ago?—Yes.

58,556. And is not the high price which oysters have attained likely to spur up the people here to greater endeavours to increase the supply?—Yes, they are doing so now.

58,557. Is the cultivation of oysters extending now?—No, but that is the result of a scarcity of brood. No brood to any extent has fallen for the last six years.

58,558. But suppose you had a good year for the brood such as you had in 1858, what would the consequence be?—It would make a great many more native oysters for the market if it were taken care of, as it was in 1858. If the native brood fell here under favourable circumstances and was caught up, laid on private grounds, and taken care of, it would give a supply of oysters for another six years.

58,559. Would the present extent of private grounds be sufficient to take all the brood an excellent spat season would yield, or would it be proper to make preparation for receiving the brood which would be supplied by such a good spat season?—I think that if we could make sure of another spat like that of 1858, and if all the companies already in existence were to purchase brood and lay it down the same as was done at that time, we should not require any more space. The grounds we have now would be quite sufficient without anything additional. The more grounds you make the dearer the oysters will be, because it makes so much more competition in the market.

58,560. Just explain that to us, because that is not in accordance with the usual principle of increasing the supply?—What I mean is this,—Over in Essex, for instance, we should have been able last year to have purchased brood for 18*s.* a wash, but the Herne Bay people went in and offered 1*l.* per wash. That of course makes the oysters dearer to the market.

58,561. The competition you refer to is a competition between the buyers of brood and not between the persons who sell the oysters?—Yes. It is the price of the brood that regulates the price of the oysters. If I give 1*l.* a wash for the brood I cannot sell the oysters for the market at less than 90*s.* per bushel on account of the loss which will occur from death. We are sure to have deaths. Some portion of the oysters will die whatever care we may take in laying them down.

58,562. If there is a good spat season there is a great increase in the quantity of brood for sale?—Yes.

58,563. And you can then obtain it at a very low price?—Yes.

58,564. You are therefore able to stock your grounds more largely?—Yes.

58,565. Would the present extent of ground cultivated be sufficient to receive that increase of stock from a fortunate spat season?—It always has been hitherto.

58,566. Is not the demand for oysters increasing?—I do not think that it is. It may be over in France. I believe that there is at present a greater foreign demand, but that is all.

58,567. Do you sell many natives that are taken

WHITSTABLE.

E. Johnson.

4 March 1865.

away to France?—Yes, and also to Belgium. We have sent some away this week.

58,568. To Belgium or to France?—To Belgium.

58,569. Were they sent away direct from here?—Yes.

58,570. In your own boats?—Yes.

58,571. Where were they sent to?—To Ostend.

58,572. Is that a new trade?—No, we have had it for five years and more.

58,573. Do they pay a higher price for the oysters than you can get in the London market?—No, they pay the same price. They give the same price here. If they buy them when the price is 90*s.* a bushel in London they get them at 88*s.*, but they have to pay the carriage.

58,574. Do you send oysters to France?—No.

58,575. Do they not go to France?—Yes, but we do not send any to Dunkirk. They come here, however, to buy them.

58,576. They also go to Ostend, and are distributed over the Continent?—Yes.

58,577. Is that foreign trade a trade that is increasing?—Yes.

58,578. When did it begin?—It sprang up about six or eight years ago.

58,579. Has it been increasing every year since?—Yes.

58,580. To what extent is it carried on now as compared with your whole trade; that is to say, what proportion do you think of the whole of the oysters caught in a year on the grounds of your company is sent away to the foreign market?—Perhaps a tenth part. I am not certain about the figures, as it is a matter I have not calculated. It would be necessary to examine the bills we keep in reference to the oysters sent abroad in that way, in order to ascertain the real quantity.

58,581. But, speaking at a rough guess, you think you send away one-tenth of all the oysters you get in the course of a year to the foreign market?—Yes.

58,582. Has this foreign demand, to a certain extent, operated in increasing the price in the home market?—It has. There is not the slightest doubt of that. It has operated not only in increasing the price of oysters in the market, but in increasing the price we pay for the brood.

58,583. You pay more for the brood in consequence of the increased demand for oysters to go abroad?—Yes. The same persons who buy our oysters for the foreign market, go to Essex and buy their half-ware and stuff which we used to buy.

58,584. For what purpose do they buy that?—To take over to their own ground. They want small oysters for that purpose.

58,585. They purchase what you would otherwise buy for laying down?—Yes,

58,586. Then in that way it operates as a double injury to you?—Yes, it does.

58,587. By depriving you of what you want for food, and also of what you want for laying down on your grounds?—Yes, and that is one of the principal causes of the increase in the price of oysters.

58,588. (*Mr. Lefevre.*) What is the size of the oysters that are taken away to be laid down on foreign beds?—They are very small.

58,589. Are they an inch and a half in diameter?—Yes, perhaps they will be about that.

58,590. Are they laid down on beds abroad?—They are not laid down upon beds, but they have a sort of pit in which they put them.

58,591. Are they placed there for feeding?—They do not feed them, but the sea comes in upon them.

58,592. Are they put there in order that the oysters may fatten?—No, they are already fattened before they go there. The people who take them will make two or three or four voyages, put the oysters together and lay them in those pits. They send them from those pits to the market for sale. They cannot keep them there for any length of time.

58,593. (*Mr. Caird.*) Are they kept there fresh?—Yes.

58,594. They are not put there for the purpose of enabling them to grow?—No, they will not breed or grow there; they would never come to anything there.

58,595. You say that the taking of oysters for the foreign market has been injurious to you?—Yes, I believe that that has been the principal cause of the scarcity of oysters down along this channel.

58,596. It has affected the price?—Yes, it is one of the things that have affected the price.

58,597. (*Mr. Lefevre.*) Are not those small oysters laid down abroad for the purpose of growing into big ones?—I believe not.

58,598. Have you told us of all the private beds on the south side of the Thames, when you mentioned Queenborough, Rochester, Faversham, Whitstable, and the beds immediately adjoining?—Yes, Herne Bay and Pollard.

58,599. And Sheerness?—Yes.

58,600. I think you said that 1858 was the last year in which you had a good spat?—That was the first year of the good spat. There was spat more or less for a year or two afterwards.

58,601. Did you begin to take up the young oysters the year after, namely, in 1859?—Yes.

58,602. How long did that last?—We kept on catching the spawn for three years more or less. The first year, however, gave us the greatest quantity of spat.

58,603. The spat lasted for two or three years?—Yes, in 1858 they discovered it, and then they found that there was spat or brood on the flats. They went to work on the flats, and they found the ground covered all over with brood.

58,604. When they began taking it, what size was it?—About the size of a shilling. Some would be less than that.

58,605. I suppose they took it until they exhausted the ground?—They worked at it as long as they could for the weather, until the winter set in, when we would not purchase it for fear it would die. There was then no other chance of catching it until the spring came. When the spring came they went at it again, but they found that what had been left all along the ground was all dead.

58,606. What had been the cause of that?—It had been killed by the five-fingers settling upon it and destroying it. They left nothing but the shells.

58,607. By 1862 were you not able to find any at all?—There has always been a little to be found here and there.

58,608. There was a question I put to the last witness, which I will repeat to you. Is it not possible that the whole ground upon the flats has become exhausted of oysters, and that there are no parent oysters left to breed?—I do not think that that has anything to do with it. I do not think that the spat that falls upon the flats ever comes from parent oysters upon the flats. There never has been anything there of any account. The flats have always been worked by the flatsmen, and every oyster has been caught off the ground that could be found upon it. There never was any quantity found on the flats.

58,609. Were there never any large oysters there?—No, the flats always depend for a supply of oysters upon the grounds adjoining. When the weather is suitable for a good spat, the sea becomes entirely filled with spawn; not from our grounds alone, but from all the grounds on the Essex coast as well. The estuaries of the Thames become filled with spawn.

58,610. (*Mr. Caird.*) That is in a good spat season?—Yes, in 1858 there was a general spat over the grounds in this country and in France. That was the year that M. La Coste obtained his success with the tiles. He has never had success with them since. I know that many people say that they have succeeded in raising spat, but it is not the case; they have not done so.

58,611. (*Mr. Lefevre.*) As the supply of beds here is somewhat limited, might not the tide carry away the spawn to places where it could not find anything

suitable for attaching itself to?—Very true; but whatever comes from those private grounds would go as it has done all over the flats, and that enables those persons who make their living by dredging upon the flats, to take it up and carry it away for sale to the owners of private grounds.

58,612. Do you believe that the flats were not worked more in 1858 than they were previously?—I do not think they were.

58,613. Then there is no reason why there should be less spat there since that time than there was before?—No.

58,614. In point of fact, you think that the spat from the private beds adjoining the flats falls so thickly in a favourable season, that it is quite sufficient to supply spawn to the whole of the flats, if all the conditions are favourable?—Yes, that is my opinion.

58,625. Would not those conditions be rather improved by planting private beds on other parts of the coast?—There would be more oysters laid in places where there are none now.

58,616. Would it not improve the chance of some of the spat finding favourable conditions, and by that means becoming preserved?—Yes, if oyster-beds were made there, and the soil was suitable, and there were shells there to receive it. In that case, no doubt, more of it, when it fell on such places, would be preserved.

58,617. Do you agree with Mr. Nichols, that if the spat were left on the flats it would never arrive at maturity, but would be strangled by the five-fingers?—Yes, I am very strongly of that opinion, and we have had it proved.

58,618. What ground have you for thinking so?—That has been the case when any of the spat has been left there. In 1860, when we had our last spat, some portion of it was left there in the winter time, when we could not go to work upon it, because if we had taken it away and laid it upon our grounds it would have been killed by the frost; we therefore left it lying upon the flats, and when we went for the purpose of taking it in the spring of the year following, we found that it had all been destroyed by five-fingers.

58,619. Did you upon that occasion find many five fingers upon the ground?—Yes, they came in like swarms of bees, completely filling the ground in a day. I never saw anything like it; we saw all the water filled with them.

58,620. Then it would be of no advantage to the fishery here if a large supply of oysters were left upon the flats for the purpose of breeding?—No, I think it would be of no advantage at all.

58,621. Then, for the same reason, it would be of no advantage to make regulations with regard to the flats for preventing oysters from being taken in the close-time?—No, it would not.

58,622. Are there any regulations as to the size of the oysters that are to be taken?—No, I believe that if you were to interfere in the matter, you would destroy all the fisheries entirely. It would also be injurious to enforce regulations preventing working on the beds in the close-time. The fact is, the more the ground is worked upon, and the cleaner it is kept, the better chance the spat has of adhering and coming to perfection when it falls. If the ground was not worked upon, every oyster would very soon become covered over with weeds. It would become coated all over with a kind of slimy weed, and the spat when it fell would not rest upon it.

58,623. Then you think it is a matter of very great importance that dredging should go on all through the summer?—Yes, I am strongly of that opinion.

58,624. Although there has been no fall of spat for the last two or three years under circumstances suitable for its preservation, do you think that that is any reason why the failure should continue?—No, but although there has been no spat the dredging has always gone on all the same for whelks. They continue dredging every year.

58,625. Dredging for the whelks would be sufficient to keep the ground clean and suitable for the fall of spat?—Yes, they do the same thing in catching the whelks as in catching the oysters.

58,626. Do you agree with Mr. Nichols in his statement that there is no considerable quantity of oysters brought from Ireland and the south coast, and laid down here?—There cannot be any large quantity, because they would not live over the year. Sometimes we had oysters on the ground which have now and then got mixed up with the natives, and have lived, but that is not often the case. If you take them as a body, you cannot get them to live over the winter time.

58,627. Then, I take it from your answer, that you do not wish to purchase oysters of less than $2\frac{1}{2}$ inches in diameter, except from the flats and the Essex coast?—Just so. We do not require oysters of a less size than that from a distance.

58,628. Then no advantage would result to you from a regulation to prevent oysters of less than $2\frac{1}{2}$ inches in diameter from being taken in the Channel, or on the Irish grounds?—No; but I think it would be a good law if some regulation were enforced for prohibiting the sale of oysters during the close season for eating. It would, however, be a good plan to allow people to catch them in the summer months for the purpose of stocking their grounds.

58,629. Would you have the Whitstable Company prohibited from selling their oysters in the four months, commencing with May and ending with August?—It would make no difference to us; we never do so.

58,630. I thought you sold oysters in the month of August?—It is only the common oyster that we sell then.

58,631. Then would you restrict the close-time to the months of May, June, and July?—Yes.

58,632. Then would you make a special exception with regard to the supply for the London market in August?—Yes.

58,633. You would limit the close-time to three months?—I think so. If the oysters have not spatted by the month of August, I know that it would be of no use their spatting afterwards. They ought to spat in May or June.

58,634. Would you prevent any oysters whatever from being sold during the month of May?—Yes, I would not allow any oysters of any kind to be sold for the market in the month of May.

58,635. Not even Channel oysters?—No.

58,636. You are aware that at present a considerable quantity of Channel oysters are sold during the month of May?—I know that that is so.

58,637. Do you also know that they are in the best state during May?—I do not think that they are best in May.

58,638. (*Mr. Caird.*) The Channel oysters that are sold in May are not caught in May?—I am speaking now of catching them in the Channel itself in May.

58,639. (*Mr. Lefevre.*) The oysters I am speaking of are caught in the Channel before May. They are laid down on beds in the neighbourhood of Shoreham, and the market is supplied with them from Shoreham during May and the early part of June. Would you put a stop to that?—Yes, I would not allow any oysters to be sold during three months; namely, May, June, and July.

58,640. That would suit the Whitstable people, I suppose?—I do not know that it would suit us more than other people.

58,641. (*Mr. Caird.*) You must understand that these oysters are not caught in May and June; they are oysters that are caught in the Channel and placed on beds to fatten at Shoreham?—Yes, I believe that is done.

58,642. They are allowed to be sold off those beds at any time, because they are not breeding oysters?—Yes.

58,643. Then what harm would that do?—They will bring in oysters from the Channel that are breeding oysters.

58,644. But nothing can be brought in from the

WHITSTABLE.
E. Johnson.
4 March 1865.

deep sea after the beginning of May?—Then it could not make any difference. The common oysters on our grounds are of no use for spawning. All the oysters that we get from the Channel we have to supply the market with in the first part of the season, in August and September, before the natives come on.

58,645. We have been told by witnesses in other parts of the country, that oysters, which have been brought from their grounds and laid down on your beds, have become native oysters; is that so?—No, it is not.

58,646. The oysters which you call common oysters are, I suppose, deep-sea oysters?—Yes, some of them.

58,647. Do they improve in quality by being laid down on your beds?—Yes, I opened one yesterday. It was fat, and I could hardly tell the flavour from that of a native.

58,648. Had it become like a native?—Yes, so far as the flavour goes, but it was not like a native in the shell.

58,649. Would the common oysters taken direct from the sea, from the deep sea, bring as good a price in the month of August, as the common oysters taken from off your beds?—No, I believe they do not fetch quite as much. When ours will fetch 12*s*., theirs will only fetch 9*s*.

58,650. Nine shillings a bushel?—Yes.

58,651. Then the common oysters improve by being laid down on your beds?—Yes.

58,652. From the experience which you have had as an oyster fisherman, can you offer any suggestion to us by which you think the supply of oysters to the London market might be increased, I mean the annual supply of oysters; have you any suggestion to offer by which that could be increased?—I do not know any other way than by getting a good spat of brood.

58,653. Then you consider that the great matter is to secure a successful spat season?—Yes, that is what we require now.

58,654. Are there no artificial means which you are aware of by which the spat of every year might be to some extent economised?—I think not.

58,655. Is it not a fact that the oysters do spawn every year?—I think so.

58,656. But the spat does not vivify in some years?—No, it does not.

58,657. Are there not some means by which so rare an article as oyster spat might every year be brought to live?—I believe there are none.

58,658. Has it been tried anywhere within the estuaries of the Thames?—Yes, I believe that some of our parties here have tried it.

58,659. In what way was it tried?—I believe Mr. Gann tried something of that sort on his ground. He dug a pit, and put some oysters in the pit; he then had some pipes laid down leading from the bottom of the pit, as I have been given to understand; I did not witness it myself. By that means he kept up a continual supply of sea water, and, I believe, the men used to go with buckets to refill the water as it ran away from the pit. The pit was formed in a warm place, and the oysters were laid there with shells and one thing and another for the spat to fall upon.

58,660. What was the result?—Nothing ever came of it.

58,661. Then the attempt was a failure?—Yes. I believe he then had a sort of pit dug, and lined with faggots; it was on the flats, and in the shallow water, and he had some oysters laid there. That was also a failure.

58,662. That was an attempt artificially to create a season favourable for the oyster spat?—Yes.

58,663. And it did not succeed?—It did not.

58,664. Do you know of any instance in the Thames where a successful attempt has been made?—No, and I think the only way is the natural way; and Essex is the best place for receiving the spat when it does fall. The coast there is surrounded by little inlets, by which means the spat is sheltered when it falls in the sea in heavy weather. If the spat falls here, and there comes on a north-east gale, it would blow it all away and destroy it.

58,665. Then the Essex coast is naturally the best spawning-ground?—Yes, I think it is naturally the best spawning-ground there is in England; and all the artificial cultivation in the world would not secure us as good spat as that on our own coast every year.

58,666. It would appear from your evidence and that of other witnesses, that the line in which an improvement should be looked for is more by securing spat than by the cultivation of the oysters afterwards?—Yes.

58,667. You say that a great loss takes place if the character of the season is unfavourable to the spat?—Exactly so.

58,668. You also say that if by any means spat could be had you would have a good supply of oysters; that seems to be the origin of the whole difficulty?—If we could get the brood we could make the oysters.

58,669. As yet there has been no successful attempt to cultivate the oysters artificially?—No, there has not.

58,670. You have no suggestion to make in that respect?—No.

58,671. How many years have you been practically acquainted with oyster-fishing?—I was brought up in this place, but I was not much acquainted with oyster-fishing until the last three or four years.

58,672. Then cannot you speak of your own knowledge of the fishing 10, 12, or 14 years ago?—No.

58,673. Has the fishing ground improved as a fattening ground?—There is no doubt of that, the same ground makes better fishing now. We never had better fishing than we have had this year.

58,674. To what do you attribute it?—To the continual working of the ground. There are a great number of us, and there are a great number of boats. More oysters are laid down and moved about during the year, especially in the summer months, and that makes the oysters so much better.

58,675. You do not attribute it in any degree to the quality of the water in which the oysters are fed?—I believe the water has something to do with it.

58,676. It is notorious, as you are aware, that the sewage of the Thames has been increasing every year, and that in the course of the last 20 years the difference has been very great?—Yes, exactly so.

58,677. Do you think that that has had any influence in fattening the oysters, namely, the dirty state of the Thames?—No, I think not; we do not get much of the sullage of the Thames here.

58,678. (*Mr. Lefevre.*) Have you been to the French oyster ground laid down by M. La Coste?—No.

58,679. Do you ever find oyster spat attached to quite large stones?—Yes.

58,680. Would it be worth while to collect the stones and scrape off the spat as M. La Coste did?—Not in the early stage of spatting I think; not until the oysters are sufficiently large to remove. As soon as we can remove them without destroying the shell, it is better to remove them. The oysters are then growing shapeable.

58,681. Has the Whitstable Company tried putting down faggots or anything of that sort for the spat to adhere to?—No, and for this reason, there are weirs both above and below our grounds, and during the heavy spat of brood in 1858 we never found any spat of consequence upon those weirs, although those weirs were made just in the same ways as the fascines and faggots you are speaking of. They were made of wood, and formed in fact a regular hedge.

58,682. What is the best material for the spat to adhere to?—There is nothing like oyster and cockle shells. Oyster shells are better than anything, and we have any quantity of them on our ground.

58,683. Are there a large number of people engaged in fishing for whelks?—Yes, a great number.

58,684. What number?—I cannot say exactly; I

must say, however, that to my knowledge there are about 400 or 500 people fishing there.

58,685. Is it by trotting or dredging ?—Both.

58,686. Trotting for whelks is stringing crabs on little strings, is it not ?—Yes, and hanging them over the boat's side. The whelk feeds on the crab.

58,687. What is the principal ground for whelks ?—All over the flats; there are a great many down on the river side.

58,688. Are there many whelks on your Whitstable ground ?—We have got a few.

58,689. Do you allow the men to trot for them here?—It is not worth their while, there is not a sufficient number; nor do we allow it.

58,690. Are the whelks sold for bait ?—Yes, and also sent to the London market.

58,691. Are they eaten by the people ?—Yes, I think so.

58,692. Is there any sprat-fishing here ?—Yes, we got a good many this year.

58,693. What number of men are there fishing for them ?—There are a good many men from Essex, and some of our own people. There may be about 30 or 40 from our own place and from Essex. Most of the sprats caught off here are brought into this place and sold to the farmers. Some are sent to the London market.

58,694. Is there any shrimp-fishing here ?—Yes.

58,695. Are there many men employed regularly in fishing for shrimps ?—Perhaps there are 20 boats that go shrimping.

58,696. All the year round ?—No, only in the season.

58,697. What is the season for shrimping ?—In the summer.

58,698. Is there any trawling for flounders, and soles, and so forth ?—Yes, in the autumn and in the spring. There are a good many soles caught here, and also plaice and dabs.

58,699. Are many of the men belonging to the Whitstable Company employed in those fishings ?—Some of them are, but there are a great many men who make their living out of it entirely.

58,700. How many fishermen are there in this place independent of the Whitstable Company ?—I cannot say exactly, perhaps 200.

58,701. Do they mostly have boats of their own ?—Some of them have boats.

58,702. Are there many oyster-boats above the Nore, above Sheerness ?—I think not.

58,703. Or above Shoeburyness ?—I think there are at Southend and at Leigh.

The witness withdrew.

FREDERICK MONGER called and examined.

F. Monger.

58,704. (*Mr. Lefevre.*) You are foreman, I believe, of the Faversham Company ?—Yes.

58,705. That company was incorporated by an Act of Parliament passed in 1840 ?—Yes.

58,706. Of how many members does the company consist ?—There are 267 members at present.

58,707. Is the Faversham Company a company like the Whitstable Company, and arranged on the same plan ?—Yes, exactly the same.

58,708. Did it begin with any capital; had it any capital of its own to begin with, or did it borrow some ?—We have always, for a great number of years traded with borrowed capital.

58,709. What is the extent of the ground you have?—It is in patches. There is not one square piece like the Whitstable ground.

58,710. About what size is it ?—I cannot state the area.

58,711. Is it of about the same size as the Whitstable ground ?—I should say that it is quite as much in extent, taking it altogether.

58,712. Was that ground under cultivation for oysters before the incorporation of your company ?—Yes, oysters were got from it long before our company was established.

58,713. Did you originally buy it of somebody else, or did you lease it ?—I believe that for 800 years it has been worked by a company.

58,714. Has the company been in existence for 800 years ?—Yes, I believe so.

58,715. But it did not obtain an Act incorporating it until 1840 ?—No.

58,716. It was incorporated in that year ?—Yes.

58,717. Has the number of men who belong to the company been increasing since then ?—I think not.

58,718. Has there been any decrease in the number ?—No.

58,719. Then it remains about the same ?—Yes, I believe there is about the same number of men in the company now as there was 20 years ago.

58,720. Can you tell me what the earnings of the company have amounted to per man ?—It varies according to the spat of brood that falls upon the ground.

58,721. Has the company been doing well with the oysters lately ?—For the last year or two they have.

58,722. In your evidence before the Committee of the House of Commons last year, you gave returns of the quantity of brood you have brought from different parts ?—Yes.

58,723. And you also gave returns of the quantity you have laid down every year ?—Yes.

58,724. Are those returns correct ?—Yes; they were taken from our books.

58,725. Did you hear the evidence which has been given to us to-day by Mr. Nichols and the other witnesses who have been examined ?—I only heard part of Mr. Nichols' evidence.

58,726. Did you hear that of the last two witnesses?—Yes.

58,727. Do you agree with what they have told us ?—I quite agree with all they have said, and particularly with the last witness, Mr. Johnson.

58,728. Are there any circumstances at Faversham which differ from those in connexion with the oyster grounds at Whitstable ?—No, I think not.

58,729. Then are there no facts in connexion with the Faversham grounds which you wish to bring before us ?—No, not that I am aware of at present.

58,730. Have you at Faversham had any greater difficulty than the people here in getting brood ?—Yes, we are at a greater difficulty than the company here.

58,731. In what way; how does it arise ?—It is because we have a smaller fleet, we do not get so much.

58,732. Do your oysters fetch as good a price as the Whitstable oysters when you send them to the market ?—Not quite as much.

58,733. What is the difference ?—We are usually about 4*s.* under the Whitstable people.

58,734. Four shillings a bushel ?—Yes.

58,735. What is the reason of that ?—Our oysters grow larger and faster.

58,736. And for that reason are they not as suitable for the market; is that the case ?—Yes.

58,737. The Faversham oysters are slightly inferior to those obtained from the Whitstable grounds ?—We do not get quite so high a price for them.

58,738. Do they not fatten as well as the Whitstable oysters ?—Yes, they are equally as good a fish; but they are generally of a larger size.

58,739. And upon that account they obtain a lower price ?—Yes.

58,740. Are they not as choice for the public ?—Yes, I think they are.

58,741. Do the public not like them as well ?—Yes, I believe they do.

58,742. Then why should there be a difference in the price ?—Being a larger oyster in size than the Whitstable oyster, the number is not so great in a

WHITSTABLE.

F. Monger.

4 March 1865.

bushel, and when they are retailed by the score or dozen they do not bring as much money.

58,743. (*Mr. Caird.*) Where is your ground situated; is it to the west of the Whitstable ground?—Yes, the Faversham ground is to the west, and also to the north of the Whitstable ground.

58,744. Is it further up the Swale?—Yes, and it is more shallow.

58,745. You do not produce anything like the same quantity of oysters that the Whitstable men do?—No; but our company is not more than one-third in number as compared with the Whitstable Company.

58,746. (*Mr. Lefevre.*) What is the reason that you are not able to produce as many oysters as the Whitstable men do; is the ground not adapted for the cultivation of so many oysters as the Whitstable ground, or is the reason that you have not so many men to work it?—At the present time we have only 150 or 160 working men. That is all we have.

58,747. If your number was as large do you think you would have the same supply as the Whitstable men?—We should be able to obtain more oysters from the flats when they are to be got.

58,748. Do you have a spat on your own ground?—Yes, frequently.

58,749. Is that the case more frequently than upon the Whitstable ground?—I cannot say.

58,750. How long ago is it since you had the last good spat?—About six years ago.

58,751. (*Mr. Caird.*) Was it in the year 1858, when there was a good spat here?—Yes.

58,752. The spat was general in that year?—Yes.

The witness withdrew, and the inquiry was adjourned until the 9th of March, at London.

London, Thursday, 9th March 1865.

PRESENT:

Professor HUXLEY, F.R.S. (Chairman). | G. SHAW LEFEVRE, M.P.

EDWARD THOMAS FERNANDEZ, THOMAS SLADE, and JOHN DARK called and examined.

LONDON.

E. T. Fernandez, T. Slade, J. Dark.

9 March 1865.

58,753. (*Professor Huxley to Mr. Fernandez.*) Have you been a fisherman?—I have been manager of a fishing company.

58,754–5. You reside, I believe, at Barnstaple?—At Instow, about 2½ miles from Barnstaple.

58,756. And you are the manager of a fishing company there?—I am not the manager of a fishing company at present, but I was the manager of a fishing company on the coast of North Wales.

58,757–8. Are you now connected with fishing in any way?—No, not at the present time.

58,759. We understand that you and Thomas Slade and John Dark are deputed by the fishermen of that locality to represent their interests before this Commission?—Yes, we are.

58,760. By whom are you so deputed?—We were deputed by a public meeting held at Appledore.

58,761. By whom was that public meeting attended?—It was attended by fishermen.

58,762–3. From what places?—We cried it round Bideford and Barnstaple. If you please, I will hand you the report of the proceedings which took place at that meeting. The meeting was called in consequence of Captain Whyte having appointed persons as his own nominees to come up here to represent the fishermen of that district, and the fishermen there did not think that the persons whom he had chosen were the most fitting persons to represent them, so they called a public meeting, and we were chosen.

58,764. (*Mr. Lefevre.*) How many fishermen were there present at that meeting?—About 50.

58,765. Were those who were present substantially such as represented the whole of the fishermen of the district?—Yes, there were some from Bideford, some from Barnstaple, some from Instow, and most of the owners at Appledore.

58,766. Can you tell me how many fishermen there are in that neighbourhood, including Bideford, Barnstaple, Instow, and Appledore?—The fishermen altogether that get their living by fishing at Appledore alone are more than a hundred in number.

58,767. How many are there at Instow?—At Instow there were about 10 or 12.

58,768. Are there many in Bideford itself?—Several.

58,769–71. Can you specify the number?—From Bideford and the other towns in the neighbourhood, taking the whole fishing in the bay together, there are 300 men nearly employed.

58,772. (*Professor Huxley.*) And do you consider those 300 persons were fairly represented by those who attended that meeting?—I do.

58,773. That meeting of which you speak seems to have agreed with respect to the numbers of the boats and the men who are employed in fishing in the neighbourhood of Appledore, and they say that there are in Barnstaple Bay 17 or 18 trawlers, employing three men in each, is that so?—Yes.

58,774. And that there are in the port of Barnstaple 8 to 10 boats employing 40 men; Appledore, 18 boats, 4 men in each; Braunton, 8 boats, 32 men; Bideford, 4 boats, 16 men; Fremington, 2 boats, 8 men. The families of the men average five to a household. We may take that, I presume, as a fair representation of the number of fishermen employed there?—Yes, each number mentioned there was put to the meeting and carried by it. We thought it best to be quite safe, therefore everything that was mooted there was put to it and carried.

58,775. It is further stated that there are 20 boats employed in rod and line fishing?—No, that is a mistake, it is hook and line fishing which was spoken of, not rod and line.

58,776. What is the description of fish which is usually caught in that district?—We catch every description of fish there, except the red mullet.

58,777. Do you catch codfish?—Yes.

58,778. And haddocks?—Yes, and whiting, and bass, and soles.

58,779. Your fishing-ground extends, I suppose, down to the Bristol Channel?—Yes, it extends from Bideford Bay down to Lundy, that is where the trawl-boats go.

58,780. Are flat-fish caught there in considerable abundance?—Yes.

58,781. Is there any herring-fishing there?—Yes, at Clovelly and round the coast; but Dark can speak to that better than I.

58,782. Do you consider that there has been any falling off in the supply of fish there of late years?—No, except from extraneous circumstances, such as bad weather and so on.

58,783. Have you noticed whether there has or not been any falling off in the supply of haddocks?—No, the supply runs generally about the same as that of some years past, but there has been a falling off of fish inside the harbour, but that we attribute solely to the cutting of the sea-weed. I can recollect when the sea-weed there was six or seven feet high, but now there is not a bit left, in some places; they strip it all off the rocks, and the consequence is, that there is no shelter at all for any of the smaller fry, and what is there is carried away in the weed. It ought to be prevented, if possible.

58,784. You are not aware, however, of any falling off in the quantity of haddocks within the last few years?—The haddocks are not so plentiful as other fish there.—(*Dark.*) Haddocks do not come in until Christmas time, and then haddocks and ling come in together, but they do not continue long.

58,785. We will take your view of the matter presently. (*To Mr. Fernandez.*) You have not heard any report of the supply of haddocks having fallen off of late years?—No.

58,786. Is that the case with regard to cod also?—Yes, I think so.

58,787. You spoke just now of the cutting of the sea-weed. Is that a source of complaint by the fishermen?—Yes, and it is most monstrous that the practice should be permitted.

58,788. How long has that custom of cutting the sea-weed been practised?—Ever since Mrs. Cleveland pretended to own the foreshore, which she said she had bought of the Admiralty, but she could not prove her right to it, and consequently everybody who chooses goes and cuts sea-weed there.

58,789. What property does Mrs. Cleveland own?—She owns property on the Instow side. She is lady of the manor, and claims a right to that weed, but lately it has been proved that she has no such right, and everybody goes and takes it. Every bit of weed is stripped off, and there ought to be some measures adopted for preventing it. Slade says that he has seen 50 people gathering it there this winter.

58,790. They cut this sea-weed for manure, I suppose?—(*Slade.*) Yes, it is used for manure, and they cut it, carry it away, and sell it to the farmers. At present there is not a bit of weed there the length of my hand. Formerly, I have been out and got in one afternoon more than 200 saleable prawns, but now if you go out all day you cannot catch 100.

58,791. How many years has that been going on?—It has been going on several years. Mrs. Cleveland claims it, and says she bought it, and Mr. Ffennell, the Inspector of Salmon Fisheries, is urging upon the Commissioners of Woods and Forests the necessity of preventing it, and certainly it ought to be prevented, for as it is the fishermen lose all the fish which used to go there to feed. I believe Slade can bear me out that there never was a year when more fish came into the harbour than there did this year, but we cannot catch them, because the best time for catching fish there is when it is nearly low water, but now, there being no shelter for them, they all go out of the harbour before that time.

58,792. What kind of fish are there in the river?—Bass, and mullet, and soles, and so on.

58,793. How are they caught?—In different ways, with hook and line and nets, both.

58,794. Then what you complain of chiefly is, not that the quantity of bass and mullet has diminished, but that you cannot catch them?—We cannot catch them, because they do not come into the harbour.

58,795. But you do not think that the quantity of fish has diminished in that neighbourhood?—No.

58,796-7. You do not think that the cutting of the sea-weed has diminished the fish in quantity, but that they will not now come into the harbour because there is no shelter for them?—We know that we cannot catch them, and we know that codfish would come there because we used to see them grovelling their noses among the sea-weed seeking for food, but now that they can get none they do not go there. They just come in and look around, and then they go out again.

58,798. One source of complaint then which you have is, that in consequence of the cutting of the sea-weed in Bideford Harbour the fish no longer resort to that harbour to stop in it?—No, only at high water, and then they just come in, look around them, and go out again.

58,799. You are not aware, so far as your experience has gone, that the cutting of the sea-weed diminishes the quantity or supply of fish?—No.

58,800. (*To Mr. Fernandez.*) What other matters of complaint are there in Bideford?—That was the principal cause of complaint before Mr. Whyte took on himself to issue this notice, under the Commissioners of Woods and Forests, we suppose, by which the fishermen were not allowed to go out without they used nets with a mesh of $3\frac{1}{2}$ inches, and that they were not to sell fish unless they were from 12 to 16 inches. The consequence is, that not a fisherman has dared to go out since on this coast, and the men are in a state of starvation. We consider this Act obsolete, that it ought to be repealed, and a new Act framed, so as to allow fishermen to use a fair net.

58,801. Can you place the notice before us?—Yes; it is a notice issued by Mr. Whyte.

58,802. What authority has Mr. Whyte to issue this notice?—He has been appointed by the magistrates, and the fishermen say that they could not have appointed a worse man for them.

58,803. But under whose authority is he appointed?—He is appointed under the authority of the Salmon Fisheries Act as conservator, and the notice has arisen out of his having taken this obsolete Act up, and the men have not had any one to represent the matter for them in its true light.

58,804. He is appointed as conservator of what?—As conservator of the rivers Taw and Torridge, in 1861. He considers he is everything and everybody, and he has taken on himself to issue this notice.

58,805. Does his authority, as conservator of the Taw and Torridge salmon fisheries, extend over the harbour and estuary?—It extends over the harbour as far as the bar, I believe, only as far as the salmon fishery is concerned, but he has taken a great deal more upon himself, and has put a noose round the necks of the men engaged in fishing, the consequence of which is, they have been thrown entirely out of work, and the greatest distress has been occasioned. Here is Slade, who is here now, has a distress in his house at the present moment.

58,806. Where is the notice which Mr. Whyte has put forth?—It is here (*handed to the Commissioner*).

58,807. I had better read it, that it may be recorded:—

The attention of fishermen is called to 1 Geo. 1. cap. 18, which is unrepealed, and still the law of the land.

By sect. 4 it is enacted:—"That if any person or persons "shall use at sea upon the coast of England any trawl net, "drag net, or set net whatsoever, for the catching of any kind "of fish (except herrings, pilchards, sprats, and lavidnian), "which hath any mesh or moke of less size than three inches "and a half at least from knot to knot, &c., all and every such "person or persons so offending shall forfeit all and singular "such net or nets so used contrary to the intent and meaning "hereof, and also for every such offence the sum of 20*l.*; and "in default of payment of the said 20*l.*, or of sufficient distress, "the offender to be imprisoned in like manner during the space "of 12 months."

The moiety of such penalty goes to the informer.

By sect. 7 it is enacted:—"That if any person or persons "shall bring to shore in England, sell, offer, or expose to sale, "or shall exchange for any other goods, matter, or thing, any "unsizeable fish, that is to say, bret, turbot, brill or pearl, "codling, whiting, mullet, bass, plaice, soles or flounders, "which shall not be of the sizes following,—bret or turbot, "16 inches; brill or pearl, 14 inches; codling, 12 inches; "whiting, 6 inches; bass or mullet, 12 inches; sole, 8 inches; "plaice or dab, 8 inches; flounder, 7 inches,—all and every "person so offending shall, for every such offence, forfeit all "and every such unsizeable fish so brought on shore, sold, or "offered or exposed to sale, or exchanged, as aforesaid, to the "poor of the parish or place where such offence shall be com-"mitted, and shall also for every such offence forfeit and pay "the sum of 20*s.*," &c.

The Conservators feel called upon to make this known.

Have any proceedings been taken under this Act?—No; because every man is frightened. They do not dare to go out, knowing that there is no mitigation of the penalty. The fishermen wanted to get a case tried before one of the Superior Courts, but they could not raise the money among themselves, because they did not believe that this Salmon Fisheries Act applied to the harbour, and, moreover, that it was void, from so long a period having lapsed since it had been brought into operation. We thought it was of no force, but it seems that it is of force, because counsel's opinion has been taken upon it.

LONDON.

E. T. Fernandez, T. Slade, J. Dark.

9 March 1865.

58,808. (*Mr. Lefevre.*) You communicated with the Board of Trade on the subject, and they told you that it was still in force, and referred you to our Commission?—The Salmon Fishery Commission was referred to, but it refused to interfere, and handed over the letter to this Commission. There is no doubt whatever that the Act is in force, because the Salmon Fisheries Act of 1861 repeals certain clauses of this Act, which puts all the other clauses in force.

58,809. It is still in force, for although it has been suffered to become obsolete, it has never been repealed. It is quite obsolete in other parts of England?—The only places that we know of where it is in operation are those places in which it has been brought into force by Mr. Whyte.

58,810. What was the mode of fishing practised by the Bideford fishermen which brought them under the operation of this Act?—Mr. Whyte was appointed by the Salmon Conservators, and in his apprehension that, by the use of their ordinary nets, the fishermen might catch unsizeable salmon, he has issued this notice, which really prevents them from fishing altogether.

58,811. But what I want to get at is, what was the mode of fishing by the Bideford fishermen which brought them under the section. Tell me what kind of nets they use?—That is the kind of net they use (*exhibiting a piece of net to the Commissioners*). It is what is called a seiner's net.

58,812. Will you be good enough to describe the seine which is used?—Do you mean the size of the mesh?

58,813. Describe the character of the net generally?—It is a drag net from 60 to 70 feet long and from 18 to 20 feet deep.

58,814. Is that a kind of net which is used for seining in-shore?—Yes, it is for drawing in-shore.

58,815. It is the ordinary seine net?—Yes.

58,816. What is the size of the mesh from knot to knot?—(*Slade.*) We always used to fish with nets the meshes of which were $1\frac{1}{2}$ inches from knot to knot. Those are the nets which he has prohibited, because the Act says that the meshes of the net shall be $3\frac{1}{2}$ inches from knot to knot.

58,817. It will shrink a little, will it not?—(*Mr. Fernandez.*) No, a good twine will always come up again.

58,818. What description of fish would you catch by means of that seine net?—(*Slade.*) We caught bass, and whiting, and mullet, soles, and flat-fish. We used to catch a large quantity of soles.

58,819. That is to say that the fishermen of Bideford do endeavour to get a great many fish besides herrings, pilchards, sprats, and lavidian with their nets?—(*Mr. Fernandez.*) Yes, they have got their living by it.

58,820. And in consequence of the meshes of their nets being less than $3\frac{1}{2}$ inches this section of the Act has come into operation?—Quite so.

58,821. Then the practical effect of this has been, that under the impression that this section of the Act could not or would not be put into operation, the fishermen have been allowed to fish with nets having meshes less than $3\frac{1}{2}$ inches from knot to knot?—Not a man could fish there unless he had such a net.

58,822. How many of these seine nets have been habitually used about the neighbourhood of Bideford?—About 13 or 14, and from Appledore and Instow four or five.

58,823. Were they used frequently,—almost constantly in fact?—They were used almost every night. More particularly for the purpose of catching soles.

58,824. Used you to obtain considerable quantities of soles in that way?—Yes.

58,825. What would be the average yield of one of these nets,—I mean in point of value,—what would be the value of the fish?—During a month or a week do you mean?

58,826. Take it in whatever way you like; give us the average weekly value, if you like?—Well, the value of the yield has lately very much increased in consequence of the railway and the facilities of sending away the fish by steamboats.

58,827. Did you fish there last year, Slade?—(*Slade.*) Yes, the whole of last year. Each man would get about 1*l.* a week.

58,828. So that each net would yield probably 6*l.* per week?—(*Mr. Fernandez.*) Yes, and we do not count that anything very great.

58,829. There would be, speaking roughly, a score of these nets at work?—Yes.

58,830. That is a fair average yield of 20*l.* a week?—Yes.—(*Slade.*) That is in our own harbour, with Barnstaple, Bideford, and Appledore boats.

58,831. So that you may be fairly said to supply the country with 120*l.* worth of fish per week by the use of these nets?—Just so.—(*Mr. Fernandez.*) That is all inside the bar.

58,832. (*Mr. Lefevre.*) From the bar right up to the river?—(*Slade.*) It runs for about 14 miles, your honour, that is the rough calculation.

58,833. (*Professor Huxley.*) Along the Appledore shore there is a great pebbly beach. Do you get any fish there?—(*Mr. Fernandez.*) They get soles directly under there, but there is generally a great sea running there.

58,834-5. How many years has the fishing, by means of these seine nets, being going on?—(*Slade.*) My father was drowned in it, and my grandfather fished there before him.

58,836. At any rate it has been going on for the last three generations?—Yes, I know that.

58,837. Has the number of these nets increased or diminished during the time that you have known the fishery?—They have increased, and they are more valuable than they were in my day at first.

58,838. How many nets do you suppose there were 20 years ago,—I am speaking of these seine nets?—I do not believe there were more than 10 engaged at any time 20 years ago.

58,839. Do you think that within the last 20 years the number of nets has doubled?—Yes, especially since the railroads have been made and the fish could be sent away easily.

58,840. In your opinion, the quantity of fish which is taken per net, has remained about the same, it has neither increased nor diminished?—I see very little difference. I never saw more fish there in my life than I did last summer; but this winter I can say nothing about it, because we could not go out in consequence of this notice.

58,841. Then I presume that there has been no falling off in the quantity of fish which is taken per net during the last 20 years?—No, although at different times of the year it does fall off.

58,842. So that there being twice the number of nets, you get twice the quantity of fish which you used to get?—It is not exactly double the quantity, there might have been 13 or 14, I cannot exactly say.

58,843-4. But speaking generally merely, the quantity of fish taken has increased in proportion with the increase in the number of nets used?—Yes, there was no demand, no outlet for the fish in those days like there is now; there were no steamers and no railroads. In my opinion, and it is the public opinion there, that, in consequence of the sea-weed being cut away, we do not get as much as we ought to have. On one occasion, I counted 50 persons there in boats and craft of all descriptions taking the sea-weed right off. I stopped there, and saw them putting it into the boats, and I saw little fish by hundreds and thousands being taken away with the weed, carted up and sold for manure.

58,845. Where is that practised,—for what distance?—From nearly out to the bar from Middle Ridge buoy, as we call it. (Mr. Fernandez explained to the Commissioners the places from which the sea-weed was taken away as described by Slade, by a reference to the map. He said it was all round by the rocks up to the lighthouse, about a mile and a half.)

58,846. (*Professor Huxley to Slade.*) Mr. Fernandez said that, in his opinion, it rather prevented the

fish being caught than diminished the quantity,—is that so ?—If they carry away the weed, it must diminish the fish, for they will not come in when they can get nothing to eat. If bret and all kinds of small fish are prevented sheltering there by the weed being carried away, it stands to reason that the great fish will not come in there.

58,847. When you are soleing, do you get much small fish ?—We do not, because, from the size of the mesh, we could not take it.

58,848. What size sole will your meshes hold ?—A three-quarters of a pound sole will go through, they push as hard as anything I know of to get out through the mesh.

58,849. Do you believe, that if you used a net with a 3½-inch mesh, you could catch soles ?—No, a sole of 3 lbs. would go out through them.

58,850. Would a net of 3½-inch meshes be of any service whatever ?—None at all.

58,851. Might you as well give up fishing there altogether ?—We might as well knock up fishing altogether, and that is what brings us here. It was agreed at the meeting that it would be fair to all parties to have a smaller mesh.—(*Mr. Fernandez.*) If we could adopt one uniform mesh the men would use the same nets for the ordinary sea fishing which they use for the salmon-fishing, so as to wear out their old nets, for it is a great expense to put by a net which has been in use, and hang it up to rot all the winter while the seine net is in use, and which it would not be required to do if it were possible to have a net of one uniform size. It would be much better if that could be done.—(*Slade.*) At present we are bound to have a seine, and a salmon net.—(*Mr. Fernandez.*) They are obliged now to have two sets of nets, one for each boat.

58,852. Have you noticed whether you get any of the particular kind of salmon called sewin ?—(*Slade.*) No, they are called salmon peal there, but we have not caught any salmon peal for two years. I know where I could use to catch six or seven at a haul, but I do not think that there have been any caught for the last two years.

58,853. Would a 2-inch mesh suit you ? How large a fish would go through that ?—A salmon of 5½ lbs. would go through a 2-inch mesh.

58,854. What mesh are you restricted to by the Salmon Fisheries Act ?—We are restricted to using nets in which the mesh is two inches from knot to knot.

58,855. Two inches from knot to knot diagonally ?—No, on the square.

58,856. And yours is 1½ inches from knot to knot ?—Yes.

58,857. Suppose you were obliged to use a 2-inch mesh instead of 1½, would that suit you ?—That would be rather too large, we think, for our fishing. It is a matter which was put to the meeting.

58,858. Of course, it is easy to understand that a net with a mesh of 3½ inches would be perfectly useless to you, but we should like to know whether, if you were obliged to use a net with a mesh of two inches from knot to knot, the difference between such a net as that and the one you use being only half an inch, you could not catch soles in abundance ?—Mullet of 2½ lbs. would go right through, and soles of a very large size would get through, for they are a fish which presses itself twice as much as what its strength is when it is trying to get through the meshes.

58,859. But you would be able to catch fish with nets the meshes of which were two inches from knot to knot ?—We might, but they would be few and large. (*Mr. Fernandez.*) Great fish of 5 lbs. and more go through the salmon net easily.

58,860. Would that half an inch in the width of the mesh be so important that it would make all the difference between carrying on the fishing profitably or unprofitably ?—(*Slade.*) It would not be at all worth while to continue the fishing, for it would not answer to let soles of 2 and 2½ lbs. go through, and they would go through a net with a mesh of that size like nothing.

58,861. Have you ever tried sea-fishing with salmon nets ?—Yes, we always do.

58,862. I do not mean for salmon but for the other fishing ?—Yes, and we have never caught anything at all.—(*Mr. Fernandez.*) We have hauled in the same place as we have hauled with the other nets, but we have never caught anything.—(*Slade.*) I will leave you to judge, your honour, whether it is likely we could, when fish of 5 lbs. weight go through the salmon meshes.

58,863. Of course, the conservator's object is to prevent your getting salmon ?—But there is an Act in consequence of the operation of which we cannot catch salmon.

58,864. But, I suppose, if a salmon gets into your nets you keep it, you do not throw it into the sea again ?—Yes, I daresay that we should smuggle a little bit, if we could.

58,865. I suppose it not unfrequently happens that you do ?—Why, you see, your honour, the men are afraid, they are too well looked after to enable them to do it.

58,866. It would be too hazardous a process, and so you let them go ?—There is a man who goes alongside to look after them, and the police too are constantly on the look out, so that it would be rather too great a risk to run to attempt to smuggle the salmon.—(*Mr. Fernandez.*) There have been one or two of the men caught. There was one caught this year at Appledore, and fined 5*l.* The punishment is very heavy. Another man was fined 10*l.*, and if they do go out at all with an illegal net they are pretty sure to be fined there, and that is what makes them so afraid of going out after the notice.

58,867. How long has this police-watching been in operation ?—(*Slade.*) There are not policemen on the water, but two men who are employed by the conservators to come alongside and look after us.

58,868. Is that since the new Act passed ?—Yes.

58,869. Do they look very sharp after everything ?—They cannot look any sharper, for they stand alongside the boats to see that you do not put any in, and then the police overhaul the shore boats, so that it is not possible to smuggle anything.

58,870. Have you any knowledge of the extent to which the authority of the conservators extends under the Salmon Fisheries Act,—does it extend to the harbour ?—(*Mr. Fernandez.*) I presume it does to the harbour.

58,871. The grievance that you complain of cannot be touched without repealing the Act relating to the salmon fishery ?—(*Slade.*) If we had nets of what we consider a fit size, they might go out and watch as much as they pleased, but if we catch a salmon in a herring net now, we are obliged to let him go again.

58,872. Have you a copy of the Act with you ?—(*Mr. Fernandez.*) No, I have not, but it prohibits the catching of salmon in such nets.

58,873-4. The Salmon Fisheries Act prevents you from using your nets for catching salmon, but what construction would be put upon having salmon in your nets ? Would the fact of having salmon in your nets be taken to be evidence that you were fishing for salmon ?—Mr. Whyte puts all sorts of constructions upon it, and certainly constructions which cannot be found in any of the clauses of the Act. The men have gone out and thought it all right, because the Act says distinctly, that when salmon are taken in such nets they are to be returned to the water as quickly as possible.

54,875. (*Mr. Lefevre.*) There is no restriction, I suppose, in regard to these nets taking other descriptions of fish ?—(*Slade.*) No, neither is there any restriction with respect to taking salmon in such nets, except that we are bound to return them as quickly as possible to the water.

58,876. (*Professor Huxley.*) Then what is it that makes the conservators, for the purpose of preserving the salmon, interfere with this kind of net ?—(*Mr.*

LONDON.

E. T. Fernandez, T. Slade, J. Dark.

March 1865.

Fernandez.) I will tell you. Under the Salmon Fisheries Act, there is no power to raise any means to pay the constabulary and the watchers. It has always been done hitherto by voluntary subscription, but there has been a falling off in the subscription, because the people conceive that they have not received any, or at most very little benefit from the working of the Salmon Fisheries Act, consequently, the subscriptions having fallen off, they cannot afford to keep up the watchmen, and it is thought that they could do without them, if they can succeed in stopping every net from going out except such as salmon could not possibly be caught in.

58,877. Then this is an attempt, according to your theory, to put down all fishing, for the purpose of preserving the salmon fishery?—Yes, and there is another thing which operates very injuriously to us—the Act says that you may fish for salmon from the 2d of February to the last day in August, but the fact is, that we never get the salmon in our harbour till the middle of May, so that we have not four months' fishing, whereas the fish are in the best condition from June to October, and I have even known them to be good up to December, but at present we are not permitted to catch them, when they are more about than they are at any other time.

58,878. Do you know a good deal about the salmon fishery in Bideford Bay?—Yes.

58,879. Can you give us any notion of the yield of the salmon fishery there?—If I had known that you would have wanted that information, I could have given you the figures exactly, because one man buys all the fish that are caught there, all the salmon.

58,880. Perhaps you can give us a rough notion of the yield?—Last year it was a very poor one. We had 18 boats from Appledore, 2 from Bideford, 6 from Braunton, that would make 26, 5 from Barnstaple, and 3 from Instow, altogether there would be 34 nets, but it was a very poor year, and those nets did not yield more than about 25*l.* to 30*l.* worth of fish apiece.—(*Slade.*) One boat caught 70*l.* worth.

58,881. How many weeks were you fishing?—About 15.

58,882. And how much do you say each would get?—We always used, when we began in time, to be able to catch about 200*l.* worth a year each net, but now we are not able to catch more than 30*l.* or 40*l.* worth.

58,883. On account of the time being cut short?—Yes, and our river being so very late for salmon.

58,884. We do not wish to go into the question of salmon fishing, but we wish to know how much, under present circumstances, you consider a fair yield of salmon per net per week?—(*Mr. Fernandez.*) It is a subject about which I have written letters to the "Shipping Gazette." These men did not catch 25*l.* worth of salmon last year in each boat.

58,885. How long were they out?—15 weeks. That 25*l.* was to be shared among six persons.—(*Slade.*) It was a very bad year indeed.

58,886. We do not ask the question because we have anything to do with the salmon fishery, for we have not, but we ask it in order to compare the value of the yield of salmon with that of the yield of other kinds of fish. Which is the more profitable to the fishermen, supposing that they were allowed to do both?—They would sooner cut the salmon-fishing altogether than the smaller fishing, because the small fishing is the main support of the men for the whole winter season.

58,887. What is the value of the fishing with the sea nets, as compared with the value of the fishing with salmon nets?—I would sooner have the small fish catching than the salmon catching.

58,888. Does the salmon catching yield as much as the catching by the other nets?—I could not say but what it might.

58,889. Supposing that the alternative were put to you, would you rather have the salmon-fishing preserved in order that you might have the full advantage of it, or be allowed to fish in your old way of fishing?—We can only get a bit of bread when we are salmon-fishing, and the season is short. The smaller fishing is more valuable to us than the salmon-fishing.

58,890. Is there any other matter of complaint? You have mentioned the size of the mesh and the cutting of the sea-weed; we think you have said sufficient about that?—(*Mr. Fernandez.*) Yes, I think so, but we cannot speak too strongly about it, for it is taken up by all the principal people as well. It is not only an injury to the fishermen but to the harbour itself, because the sea runs in much heavier than it used to, and there was a much greater depth and calmer water in the harbour than there is now.

58,891. (*Mr. Lefevre.*) How many men are there employed in cutting this sea-weed?—It is all done in a very short time; they soon strip it off.

58,892. Is it used for manure?—(*Slade.*) Yes, it is run up the river in boats.—(*Mr. Fernandez.*) I have bought some myself, doing what everybody does. If all were restrained by Mrs. Cleveland or her tenants from doing it, the fishermen would not, but while everybody else cuts it, they do not see why they are not to earn an honest penny by doing it.

58,893. How long has this practice of cutting sea-weed existed?—(*Slade.*) About 15 years.—(*Mr. Fernandez.*) But it has been taken away more this year because Mrs. Cleveland took the matter up and other persons disputed her title.

58,894. Is it only taken at one period of the year?—Yes, that is all.

58,895. It is taken, I suppose, for manure for potatoes?—Yes, that is what it is taken for.

58,896. Your complaint is, that the fish do not come into the harbour so much as they did formerly, in consequence of the cutting of this sea-weed?—Yes, I have seen, I should think, hundreds of thousands of small fish of various descriptions taken up and thrown with the sea-weed into the boats, and they have been afterwards carted away into the country, and spread on the ground for manure.—(*Slade.*) Everything is cut away clean from the rock altogether.

58,897. (*Professor Huxley.*) Is there any other matter that you would like to bring before us?—The sea-weed is the main article,—that, and the size of the mesh.

58,898. (*Mr. Lefevre.*) Is the mesh which you have shown us the smallest that is used?—No, there are some people in the harbour that have got what we call wading nets, which are much smaller in the mesh.

58,899. Are there a good many of them used?—Yes, a good many. There are men at Instow, I think, who use them.

58,900. In what proportion are such nets used below the size you have mentioned?—Most of the Barnstaple men have them.

58,901. What is the average size of the meshes of those nets?—I believe some of them run down to a quarter of an inch, they range between that and three-quarters.

58,902. What size have you seen them, Dark?—(*Dark.*) I have seen them three-quarters.—(*Mr. Fernandez.*) I have stated in evidence that the average size of the nets used is 1½ inches from knot to knot, but, in my opinion, most of the Appledore men have nets with smaller meshes. I believe they have nets that will take fish of one pound weight.

58,903. (*Mr. Lefevre.*) Supposing that meshes the size you mention, 1½-inch meshes, were legalized, and it were made illegal to use smaller meshes, would it put a stop to a great many?—I should think it would stop the Barnstaple nets, most of them.

58,904. How many would it stop in the river, do you think?—Perhaps seven or eight.

58,905. I suppose we may take it that those nets take a very considerable number of the smaller fish in the river?—Yes.

58,906. Small soles and mullet, I suppose?—Yes.

58,907. Do they ever take any samlets?—I have seen a few caught, but very few.—(*Slade.*) They

wade in the river with them. I have myself caught a ton and a half of bass and mullet with such nets.

58,908. Where you are using a net of that kind 60 fathoms long, I suppose you would catch almost everything that was in the river?—Yes, no doubt.

58,909. (*Professor Huxley.*) Then would you not take a good many samlets?—No, the water would be too shallow for them, and if we did, we should be bound to take them out of the nets as quickly as possible, and throw them into the river again.—(*Mr. Fernandez.*) I have never seen any taken myself.

58,910. (*Mr. Lefevre.*) The men go out with the seines at night, I suppose?—(*Slade.*) Yes, that is the only time to catch soles.

58,911. If you were restricted from fishing during the night, it would be a considerable disadvantage to you?—Yes, the fishing that takes place in the daytime is considered very little good.

58,912. Do the men of whom you have spoken, the watchmen, go out at night to see that no salmon are caught?—Yes.

58,913. How many of them are employed?—Sometimes three or four. There are always two regularly employed. Last winter, when we have not been using these nets, one boat has been thought sufficient.

58,914. The winter before were there any watchers?—Yes, four or five.

58,915. Then the conservators of the river must have gone to considerable expense to ensure that the salmon should not be taken?—Yes.

58,916. Are the men employed during the open salmon-fishing season in fishing for salmon?—Yes.

58,917. They are all so employed?—Yes, they are all employed in that.

58,918. It is only during the close salmon time, then, that they are employed in fishing for these smaller fish?—(*Slade.*) Yes, and they use the smaller seines to get the smaller fish.

58,919. At night?—Yes, we go out at night.

58,920. Besides these seine boats, are there any trawling boats belonging to Bideford?—There are four or five.—(*Dark.*) Three at Bideford and one at Appledore.

58,921. Do they fish outside the bar?—(*Mr. Fernandez.*) Yes, but John Dark will speak more particularly in reference to the trawlers. There is another point that was mentioned at the meeting to which I have referred, and that is, that if the new Act was to be in operation, the fishermen thought it was but justice that they should not be treated in the same way as those engaged in the salmon fishery, that is, that if they were obliged to have new nets they should not be at the loss of the old ones.

58,921*a*. You think that the fishermen ought to be compensated for the loss of their old nets?—Yes, or else they ought to be allowed to use them till they are worn out. I may tell you that those which have been used in the sea-fishing will not last much more than one season.

58,922. It was, you say, the general opinion of the fishermen that there should be a legal size for the mesh, and that it should be $1\frac{1}{2}$ inches?—Yes, there is no doubt about that.

58,923. Is there any shrimping in this river?—There used to be, but it is mostly all gone since the sea-weed has been cut away. The hook and line fishermen were represented at the meeting, and one of them said, that up to the day when they commenced cutting the weed he used to catch 20 lbs. to 30 lbs. of fish a day with hook and line, but that directly the weed was cut and cleared up, he could not catch a couple of pounds.

58,924. (*Professor Huxley to Dark.*) Where is your residence?—I live at Bideford, and trawl for soles.

58,925. Have you ever been in the herring fishery?—Yes; line-fishing was what I was first brought up in, but for the last 15 years I have been at Bideford trawling in the bay constantly.

58,926. We have had it represented to us that there is a considerable number of trawlers working upon the south shore of the Bristol Channel, and that there are 17 or 18 in Barnstaple Bay?—About 18 properly. There are two or three from Appledore, four or five from Ilfracombe, four from over the bar, and six or seven from other places. Then there are pilot boats, which come in and trawl among us when they are looking out for vessels in the Channel, so that we generally muster in the bay about 20, 17 or 18 of which are regular trawlers.

58,927. Which is the trawling ground of these trawlers?—It is a very small ground, and very rough.

58,928. Do they work along the shore, or how far off the south shore do they work?—They lie rather on towards the north shore.

58,929. Quite in the bay?—Yes.—(*Mr. Fernandez.*) They are all in the bay.

58,930. You are all inside Lundy Island?—(*Dark.*) Yes, a great many miles.

58,931. You do not venture down to the Tenby trawlers' ground?—I have been out there.

58,932. But you do not work with them?—No; we are a great many miles apart.

58,933. Then you work through Barnstaple Bay, having your trawling ground to the southward?—We cannot go to the south, that would be Tenby men.

58,934. (*Mr. Lefevre.*) There is no ground south of Annisland Point?—No; there is nothing but a rough bottom.

58,935. How far north do you go?—Six or seven miles off land; there is no good ground after that, but rocks and rough bottom, and beyond that there is a very strong tide running there, which keeps the bottom quite clean.

58,936. (*Professor Huxley.*) You have not above seven miles to trawl?—We cannot have our trawl down more than half an hour, the wind hauls us up.

58,937. Is not the ground seven or eight miles across?—But we could not sail so long a distance as that; we could not drive a trawl beyond five miles.

58,938. How many miles do you actually trawl when you are out all together?—Not more than a mile or a mile and a half, and in some places not more than a quarter of a mile.

58,939. What size trawlers do you employ? What is their tonnage? You employ three men in one?—Yes; the boats measure six or seven tons.

58,940. Are they decked boats?—Yes, all decked boats.

58,941. What is the length of their beam?—About 33 feet; $32\frac{1}{2}$, that is the length of my beam.

58,942. Is that the general size for the trawlers?—No; there are not more than one or two of them of that size.

58,943. What would be the smallest size?—They may run down to 23 or 24 feet beam.

58,944. And they are all decked boats?—Yes.

58,945. Cutter rigged?—Yes, fore and aft.

58,946. How many years has trawling been going on there?—Ever since I was a boy; 35 years and more. There is a man living now who made the first trawl that was ever made in the bay, old John Whitefield.

58,947. Has the number of trawlers increased or diminished within the last few years?—They have increased within the last two or three years, but some of the boats have been sold lately.

58,948. At what place did that sale take place,—from what port?—At Ilfracombe; one of the boats has just been sold.

58,949. For what reason was it that the owner sold his boat?—Fish are very scarce in the bay; the water is shallow, and if we get a ground sea on, we can never get anything like good trawl-fishing. We cannot trawl in the winter for weeks together, and even in the summer we cannot trawl if the sea is at all disturbed. The water in the bay is so shallow, that when there is a sea on it is disturbed right to the bottom.

58,950. Apart from bad weather, has the quantity

LONDON.

E. T. Fernandez, T. Slade, J. Dark.

9 March 1865.

of fish in the bay remained the same, or has it diminished?—There were plenty of fish there last summer. I have trawled in the bay for 20 years, and they were as plentiful then as I have ever seen. We had finer weather, too, than what we have had for many years.

58,951. You think that, with reasonably fine weather, you could get as many now as ever you could?—Yes, as much as was ever known to be taken.—(*Mr. Fernandez.*) There was a man called Brown, who stated at the meeting that they made 5*l.*, 6*l.*, or 7*l.* a week.

58,952. Do you know Clovelly well?—(*Dark.*) Yes, very well.

58,953. How many years have you fished there?—Twenty years.

58,954. How many trawlers fished from Clovelly when you first knew it?—Five or six boats altogether.

58,955. How many 14 or 15 years ago?—There might have been then six or seven boats, of which two or three, perhaps, would be trawlers.

58,956. How many are there now?—There are eight at present.

58,957. Then has the number remained about the same all the time that you have known Clovelly?—It has rather increased than otherwise, but not much. They have not gone less, certainly.

58,958. I ask you the question particularly, because it has been stated to us that, 14 or 15 years ago, there were as many as 17 trawlers there?—(*Slade.*) That is in the whole bay. They all trawl off Clovelly; the trawling ground is just off Clovelly for nearly all of them, and the Clovelly men have got mixed up with the others.—(*Dark.*) You may depend upon it there were never more than eight or nine from Clovelly itself.

58,959. Do you think the number of trawlers in any one of the ports has increased or diminished?—Within the last 20 years they have increased.

58,960. Do your trawlers think that the seine men working in-shore do them any harm?—Not a bit, that I ever heard.

58,961. You never heard any grumbling by the Bideford men, that the seiners were destroying the fish?—Never.

58,962. You trawl through the middle of Barnstaple Bay, and get all you can there, and they work their seine in-shore?—Yes, they are in the harbour, and we are out in the bay.

58,963. (*Mr. Lefevre.*) They do not seine outside the bay?—No, in the harbour.—(*Mr. Fernandez.*) They go out just beyond Middle Ridge buoy.

58,964. Is there any seining beyond the bay?—(*Dark.*) No, the boats could not work there.

58,965. (*Professor Huxley.*) In working with your trawls, do you ever get up any considerable quantity of small unsaleable fish?—No, never.

58,966. Do you ever get up any fish spawn?—Yes, fish spawn, what we term squid. I have seen it all alive.

58,967. I mean the eggs of fish?—No; I never saw any fishermen who could describe the spawn. I think the water is too shallow and too much disturbed in the bay for any to lie there. I think the fish run out into deeper water to spawn,—perhaps 40 fathoms deep,—where the currents do not affect it.

58,968. At Clovelly, there is or used to be a great herring fishery?—Yes.

58,969. Is there much now?—Not so much as there used to be; we have had such a succession of rough weather there.

58,970. Do you think that the quantity of fish there has fallen off?—No, but the herring-fishing has not been so good since we have had such bad weather. Last season it was better again.

58,971. How many herring-boats are there now in the port of Clovelly?—I cannot say the number exactly. Some 10 or 15 years ago there were 70 or 80, but last year not above 30 or 40 put their nets in.

58,972. Is that because the supply of herrings has fallen off, or is it because of the bad weather?—The fish were plenty enough, but in bad weather they do not come into the bay. We have not had a good shoal of herrings in the bay for many years back till the last year, solely on account of the bad weather.

58,973. Clovelly is exceedingly exposed, is it not?—Yes, it is very shallow water there, with a ground sea. That has everything to do with fishing, because if there is a heavy ground sea we can get no fish whatever, but if we get fine weather then we can get fish of all sorts there.

58,974. The Clovelly fishermen, then, do not think that the quantity of fish has fallen off at Clovelly?—In my opinion, the fish there were more plentiful last year than ever they were before. We had a better shoal of whiting there than we have had for 13 years. The fish do not come into the bay as often as they used to, and so far they used to be more plentiful, but last summer and this winter they have been more plentiful than I have known them for several years.

58,975. Do you know Minehead?—Yes.

58,976. There used to be a considerable fishing and curing establishment there?—Yes, there used to be at the time when there was a good supply there.

58,977. How long ago is it since they have had a good supply?—Never since we have, because we always fish by them. All the fish we catch are going to the westward, and we fish at night right across their road.

58,978. Can you tell me how many years it is since they had a good supply?—They have never had a good supply of fish since the time when ours fell off.

58,979. How long ago is that?—Well, I might say 8 or ten years ago.

58,980. Then there has been no fishing at Minehead for the last 10 years?—No, not so much as there used to be.

58,981. Has there been any fishing there at all?—Oh, yes, there is fishing there, but the fish are not so plentiful as they used to be.

58,982. What is your great herring season at Clovelly?—We used to begin in August and to get what are called the summer shoals in the latter part of the summer.

58,983. How many years ago is that?—About 10 or 11 years ago.

58,984. Would they be in good season then? When would they become full?—They would become full of roe about Christmas.

58,985. As late as that?—Yes.

58,986. That would be then when you got the autumn fishing?—Yes.

58,987. But your general fishing now at Clovelly is in January or February?—Yes, in January and February. Long ago, we used to get the best fish in November. They were not quite so full after November as they were before.

58,988. What time do you commonly get fish full now at Clovelly?—About December.

58,989-90. But your regular fishing some years ago used to be in January, used it not?—No, we get no herring-fishing in January, all the fish then have shot their spawn and they get quite poor. We may get a little line-fishing. On towards Plymouth and the south side, that is the best time.

58,991. You never had a January fishing then?—No, it is so very rough then, and all the fish go out of the bay when the weather is rough. You may say that in January and February all the fish that we catch are caught by the hook and line, but for the most part the weather is so rough that the boats cannot go out.

58,992. When did you get your herring-fishing last year?—In September, October, and November. After that there were very few caught.—(*Mr. Fernandez.*) I think it was very bad during the last season, and the Clovelly people themselves had to buy fish.

58,993. Do you cure herrings at Clovelly?—(*Dark.*)

LONDON.

E. T. Fernandez; T. Slade, J. Dark.

9 March 1865.

Yes, for if the fishermen cannot salt a few herrings, it is as bad for them as it is for country people when they cannot put a pig into the salting tub for the winter.

58,994. Have you noticed any difference in the quality of the fish of late years?—No, a better shoal of fish or better sized fish never came in than came last year.

58,995. Have you much difficulty in sending away your fish from Clovelly?—No, but since Mr. Whyte stopped our fishing we have had no fish to send away.

58,996. What is the nearest railway station from Clovelly?—13 miles; it is at Bideford.

58,997. Have you found the railway station at Bideford of great use to you, in enabling you to send away your fish?—We have none to send away.

58,998. No herrings?—No, none come from there to London, and no other fish except salmon, and not many of them. You will find on inquiring that we have had rougher weather for seven or eight years than we had last summer, and more ground sea in our bay all the time I have worked at the fishing.

58,999. Then you ascribe the want of success in fishing to that, and not to any falling off in the quantity of fish?—The fish are as good as ever, and the fish are as plenty as ever, but as soon as the bad weather sets in they are gone, and all the fishing is over for the season.

59,000. (*Mr. Lefevre.*) What do you do with the fish which you catch by trawl-fishing?—They are mostly sold in Barnstaple and the neighbourhood.

59,001. Then it goes by the train?—Oh, yes, a long way by train.

59,002. What size mesh do you use?—I have the size with me, because here are pieces which I have cut off from my own trawl nets (*producing it*). They are of different sizes, but I have brought the largest and the smallest.

59,003. (*Professor Huxley, having measured them.*) The largest size is two inches from knot to knot, and the smallest will be 1¼ inch?—I think you will find that the general average is about two inches.

59,004. (*Mr. Lefevre.*) Did Captain Whyte threaten proceedings against the trawlers?—He did.

59,005. He considered that the trawlers' nets came within the restrictions of the Act as well as those of the seiners?—Some of the nets were sent to him, and at first he said that the meshes were not too small, because he thought they might be measured the short way, but afterwards he said that from knot to knot was only half the mesh.

59,006. (*Professor Huxley.*) From knot to knot is the square way?—Yes; but he would have it, at first, that it was the other way.

59,007. (*Mr. Lefevre.*) Did Captain Whyte threaten you with legal proceedings if you did not use a net three and a half inches the square way?—No; he said that he would write to your Honours about it.

59,008. Did he threaten you with legal proceedings if you continued to use nets with the kind of mesh which you have shown to us?—Yes.

59,009. And, in consequence of what he said about your nets, you have not been out since?—No; and the consequence is, that I have had to go about as I could, to pick up a living.

59,010. Have any of the trawlers been out since?—No, not any; because they are all afraid of this old Act being brought into operation. He threatened to fine us 20*l.* apiece, and there is no mitigation, so we should be sent to prison.

59,011. Then there has been no trawling at all in the bay this winter?—Not since this notice was issued, I believe.

59,012. And has there been much distress in consequence among the trawl fishermen?—Very great distress, because, if men are not allowed to work, and have nothing but what they work for, they must feel distress.

59,013. Are the trawl fishermen ever engaged in seining?—Sometimes they are employed in seining about Clovelly, but they never own seines.

59,014. What do they do at other times?—They are engaged in the herring-fishing, spilliard-fishing, and hook and line fishing.

59,015. You are an owner, I believe, yourself?—Yes, I own a boat called the "Wesleyana."

59,016. How do you pay the men?—They are paid by shares. The trawl gets a share, and each man a share. There are five shares.

59,017. Do the Tenby men ever come over your ground to trawl?—Very seldom.

59,018. You attended the meeting at Appledore yourself, and were deputed by that meeting, with the other witnesses, to give evidence before us, for the purpose of representing them?—Yes.

59,019. Have you any reason to believe that any number of fishermen engaged in seining or in the salmon-fishing approve of this proceeding of Captain Whyte?—I do not think that anyone agrees with it, neither the men themselves, nor the inhabitants of the towns and villages, because they have felt the loss of the fishing very much indeed.

59,020. Has there been any public meeting called by the conservators of the rivers Taw and Torridge, with reference to what sized meshes ought to be allowed to be used?—No, sir. I have been up to the magistrates, at the Townhall of Bideford, and they recommended me to write to the Deep Sea Fishery Commissioners. I did so, and had an answer from you.

59,021. (*Mr. Lefevre.*) In consequence of the meeting at Appledore you wrote a letter to the Commissioners?—Yes, I would have sent the letter to the Commissioners before, but I heard that Captain Whyte was appointing men to attend here.

59,021*a*. Your letter is as follows:—

Bideford, March 4th, 1865.

To the Honourable Sea Fishery Commissioners.

Honourable Sirs,—In October 1864, I transmitted to your Honours one of two printed bills which had been handed me by Captain Whyte, one of the Conservators of River Fisheries for the Taw and Torridge Rivers (Bideford being on the Torridge).

The printed bill recited an almost obsolete Act passed in the reign of 1st of Geo. 1., cap. 18, which is unrepealed and still the law of the land, and at the same time I craved your advice for my future guidance.

I am the owner of a small fishing craft, which I have used in Bideford Bay, and have been a fisherman for the last 20 years, using a trawl net with meshes from 3 to 4½ inches in length for catching soles, turbot, plaice, dabs, hake, gurnet, and abundance of thornback, and I was threatened by the said Conservator, that if I acted contrary to the provisions therein recited that he would prosecute me for the penalty of 20*l.*, or the alternative of 12 months' imprisonment. The intimidation, therefore, has had the effect of frightening your complrinant from pursuing his humble calling of fishing in the bay ever since, to the great privation of myself and family. I received an answer from your Honourable Board, dated the 15th of October last, wherein I was informed "that in the course of the "winter the Royal Commissioners will hold an inquiry at "Bideford (of which due notice would be given), for the pur-"pose of taking evidence on the subject of the Sea Fisheries in "that neighbourhood, and of hearing any complaint that may "be made in reference to them."

I omit the next passage. Your letter then goes on to say, that a meeting was held in consequence at Appledore, and proceeds as follows:—

The meeting was highly pleased to hear my correspondence read by the Chairman, and will anxiously await your reply to this letter, as, I humbly trust you will inform me the exact meaning of the Act 1st Geo. 1., cap. 18, with respect to the three inches and half from knot to knot, the knotty question which has laid up so many fishing crafts and nets, for so many months past; viz., "Wesleyana" (my vessel), "William and Jane," Prance, and "Gem," Prance, all of Bideford, and "Three Friends," of Appledore, principally belonging to their several masters. There has also been laid up 12 skiffs, with 36 men, at Ilfracombe and Clovelly, all through, I presume, the river Conservator's circulating the said handbill and misinterpreting the meaning of the dimensions of the mesh for trawling purposes, which he insisted that three inches and a half from knot to knot would be seven inches in length, although I carried a piece of net to his house at Instow and showed him; but the real meaning, as explained by old John Whitefield, of Clovelly, who knit the first trawl net ever known to be cast in Bideford Bay, is from

LONDON.

E. T. Fernandez, T. Slade, J. Dark.

9 March 1865.

knot to knot, the whole mesh, whilst the Conservator's mesh would let a 20-foot shark pass through it as clean as a whistle.

Thus, the poor fishermen's enemy has been condemning lawful nets, as are used at Plymouth and Bideford, of his own accord, without having, I suppose, been appointed Conservator of sea fisheries; and it would grieve your Honours to know the lamentation and starvation caused by an uncalled-for ignorant enthusiast, among so many fishermen, their wives and families; and who ought to be prosecuted for the injuries done to so many industrious men and deserving families.

59,022. The passages I have read from the letter represent your feeling and wishes on the subject?—I believe, if you go to Bideford Bay, you will find that every man interested in the fishery there will hold up his hand in support of what I have stated in the letter. At present, all are fearing the prospect of starvation and distress, both those who buy the fish and those who are employed in catching them.

The witnesses withdrew, and the inquiry was adjourned until the 11th March, at Brightlingsea.

Brightlingsea, Essex, Saturday, 11th March 1865.

PRESENT:

J. CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

BRIGHTLINGSEA.

H. S. Goody.

11 March 1865.

HENRY SIDNEY GOODY called and examined.

59,023. (*Mr. Lefevre.*) You are clerk to the Corporation of Colchester?—No, I am not, but I am clerk to the Colne Fisheries Company.

59,024. The oyster grounds in the Colne have been vested in the Corporation of Colchester from time immemorial?—The soil has.

59,025. By virtue of a grant which goes back as far, I suppose, as Magna Charta?—It goes back a very long way, but I cannot say how far back. I think the original grants have been lost in some cases, but there is no doubt as to the Corporation being entitled to the soil of the river.

59,026. In addition to the Corporation, is there not a body called the Colne Fisheries Company?—Yes.

59,027. They were established here, I believe, by an Act of Parliament passed in the reign of George II.?—No; they were noticed by that Act, and, if anything, they were confirmed by it.

59,028. In 1827 they made rules for the purpose of carrying on the fisheries?—Yes, but they had rules previously. Those were the last rules that were made.

59,029. By virtue of those rules and of the Act of Parliament, the right of fishing in the Colne is limited to Colchester and eight parishes adjoining the river Colne?—No, I should hardly say that the right is given by that Act. The right goes far beyond that in date.

59,030. At all events, that Act of Parliament confirms the ancient charter?—I would rather not enter into a discussion with regard to the legal question.

59,031. We have no desire to enter into the questions which are in litigation between the Corporation of Colchester and the fishermen, but I presume we may take it as a fact that there are disputes between the Corporation and the dredgermen, as to the right of licensing the fishermen—is that not so?—Yes, there are disputes as to the question of licensing.

59,032. Can you tell us what number of men have been in the habit of receiving licences from the Corporation?—The number has varied from time to time. At present it is about 400.

59,033. Are those licences limited to men inhabiting Colchester and the eight parishes adjoining the river Colne?—Yes.

59,034. And those men who have been apprenticed to the work?—Yes.

59,035. For some time past there has been a sum of two guineas charged by the Corporation for each of those licences?—Yes.

59,036. Has it ever been the practice to grant licences to the public generally?—No.

59,037. It has not been the practice to grant licences to people living beyond Colchester and the eight parishes adjoining the river?—No, not to my knowledge.

59,038. Can you tell us what is the area of ground over which the right of the Corporation extends?—No, I only know that it is the river Colne.

59,039. From the mouth of the river Colne?—Yes, up to Westness.

59,040. Has the number of licences granted by the Corporation been increasing of late years?—Yes, the number has been gradually increasing.

59,041. Can you give us the comparative numbers,—say at the present time and 20 years ago?—I should imagine that during that time they have probably increased about 100. I am speaking, however, without anything like accurate data, but I think the increase would have been from 100 to 150.

59,042. I see that the rules which we have here before us, and which were set out in 1827, have not been altered since?—No.

59,043–6. The fisheries are now worked under those rules?—Yes.

59,047. How are the fisheries managed?—The fisheries have been managed by a jury of management.

59,048. How are the jurymen appointed?—They are appointed in the Admiralty Court.

59,049. By the dredgermen themselves?—They are appointed by a return of names, from which a number is selected by ballot.

59,050. And dredging is prohibited from the 1st of August until such a day as is appointed by the foreman and jury?—I daresay that is the fact; whatever is down there forms the rules in existence.

59,051. Is there a day fixed every year for the close of the fishery?—There is no certainty with regard to the day on which the fishery shall be closed, but there is a deed of arrangement entered into between the dredgermen and the Corporation.

59,052. Does the date at which the fishery closes vary from time to time?—Yes.

59,053. There are also other rules to prevent oysters below a certain size—$2\frac{1}{4}$ inches—from being taken. Is that not so?—Whatever it says there, is no doubt correct.

59,054. It says here $2\frac{1}{4}$ inches; oysters below $2\frac{1}{4}$ inches are not to be taken?—No.

59,055. There is also another rule to prevent culsh or spat from being carried away from the ground?—Yes.

59,056. And there is another rule, to the effect that all five-fingers and mussels caught in the water shall be destroyed?—Yes, these rules were made for the general protection of the fishery.

59,057. Is there an officer appointed by the Corporation or dredgermen to see that the rules are carried out?—There is a water bailiff appointed by the Corporation.

59,058. Has the water bailiff the power of seeing that the rules are properly carried out?—His powers, whatever they are, are mentioned there.

59,059. Are there any watchers appointed besides

the water bailiff?—There are watchers appointed, but they are appointed by the Company themselves.

59,060. Are there any statistics kept with regard to the quantity of oysters taken from the river?—There are accounts kept, I believe.

59,061. Can you supply us with them?—I have not got them, and I do not know if my knowledge on the subject would be sufficient to enable me to give you any information on that point. The Company, I believe, have books showing a debtor and creditor account, from which statistics might be obtained.

59,062. The rules give the dredgermen certain powers of borrowing money for the purpose of laying down spat?—Yes.

59,063. Have those powers been exercised?—Yes.

59,064. Do they lay down spat every year?—I hardly understand what laying down spat is.

59,065. Have they raised money under these rules?—Yes.

59,066. Do they do so every year?—No.

59,067. When was the last time that they raised money?—What I mean to say is, that they may raise money every year by overdrawing their banker's account. In one sense, that is, raising money, and they do that every year, I believe.

59,068. Then do they not carry on operations on the oyster ground as a company?—Yes, they carry on operations there as a company; but when you speak about depositing spat every year, I scarcely understand what you mean. That is a thing which we wish we could deposit.

59,069. What I mean is this,—do you buy spat every year, for the purpose of laying down on your oyster ground?—The oyster spat is a thing we could not buy. The spat itself is very small, but it goes from spat to brood.

59,070. Then take it as brood. Do you buy brood?—No, not every year. If the season does not happen to go against us, the oysters in the river will provide spat themselves.

59,071. But, in a season when there is not much brood in the river itself, do you buy it from other places, and lay it down?—No.

59,072. Have you done so sometimes?—They have bought some at times, but it has been a question whether, on the whole, it has proved profitable. I think it has not proved profitable.

59,073. How is the money repaid?—It is repaid when the river turns out favourable; that is to say, when the season improves.

59,074. How is the money raised,—is it done at the dredger's individual responsibility?—No.

59,075. Do they each contribute towards the whole?—No.

59,076. Then how is it raised?—By a certain number of them putting their names to a security.

59,077. Supposing that they borrow from their bankers 3,000*l.* or 4,000*l.*, how is the money recovered from the dredgermen, in order to repay the bankers?—When the money is received from the oysters, it is repaid.

59,078. Does each of the dredgermen contribute in proportion?—He does not do it so as to place himself under a responsibility.

59,079. Is there no legal means of raising money for the purpose of paying off advances?—Only as the money comes into the hands of the fishers.

59,080. Does the money received for licences go towards repaying advances made to the Company?—The money paid for licences goes to the Corporation.

59,081. Does each dredgerman have what he dredges up, for his own advantage?—No.

59,082. Does it go into a common stock?—It goes to the Company. The fisheries are under the management of a company, and every one participates equally, but every man does not dredge for himself, or take away oysters for himself.

59,083. The take of oysters is put into a common stock?—Yes.

59,084. And the profits are divided amongst the dredgermen?—Yes, they all share equally. But, in addition to the dredgermen, there are widows and others who have an interest in the profits.

59,085. (*Mr. Caird.*) As I understand, it is a common purse?—I do not know what you mean by that.

59,086. You said that they overdraw their banking account for the purpose of obtaining money to purchase brood. That is done, I suppose, on the general credit of the whole incorporated body of dredgers?—It is paid out of the proceeds, whenever there is a return.

59,087. Then there is a common purse, both for the expenditure and the receipts, and I presume that the whole of the dredgermen participate in the profits realized?—Yes.

59,088. Are the profits equally divided amongst the dredgermen?—Yes, equally.

59,089. Do you sell brood at all here?—No, never.

59,090. Does the Corporation of Colchester, in return for the licences, do anything in the way of preserving the oyster ground here, and of cultivating the oyster ground?—No, nothing.

59,091. They make no outlay whatever for the cultivation of oysters?—No.

59,092. Has the quantity of oysters increased on the oyster grounds in the Colne within the last ten years?—That is a matter which from year to year must vary. Some years there may probably be a large supply on the oyster ground, and before ten years shall have elapsed the supply will be greatly diminished. That, for instance, is the case at the present time.

59,093-4. But, taking the average of years, are you able to say whether the general supply of oysters to the public from the river Colne has been increasing, stationary, or decreasing? Can you say what has been the sale during the last ten years?—The supply has decreased for the last six years. But this is a question which the water bailiff would be able to answer better than myself.

The witness withdrew.

EDWARD STAMMERS called and examined.

E. Stammers.

59,095. (*Mr. Caird.*) You are the water bailiff?—Yes.

59,096. How long have you been water bailiff?—I have been water bailiff 24 years.

59,097. Can you tell us whether the quantity of oysters taken here and supplied to the general market has increased in the period during which you have been water bailiff?—It has fluctuated. They have been decreasing during the last ten years.

59,098. Decreasing?—Yes, on account of the want of spat. We have had none for the last six years.

59,099. How has it been during 20 years? Can you give an average of the last 20 years without confining yourself to good or bad years? Would the general average supply of oysters from the oyster ground during that period show an increase or diminution?—In 1842 we were just about the same as we are now; we had none whatever.

59,100. You had no spat?—No, we had no spat.

59,101. That was in 1842?—Yes.

59,102. Can you tell us what the supply was in 1843?—I cannot say, my memory will not serve me.

59,103. What was it in 1852?—I cannot say, I have not kept any account of these matters, but I know that the supply has been decreasing for the last six years.

59,104. When was the last good spat year?—Six years ago.

59,105. In 1858?—Yes.

59,106. Had you a very good yield of oysters in 1858?—We had a large quantity of spat in that year.

59,107. What was the result of that?—The result

RIGHT-LINGSEA.

E. Stammers.

1 March 1865.

has been that we have been selling the remains of that spat ever since, and we are selling it now.

59,108. Had you a good oyster season in the year following 1858—the year after that good spat?—I cannot say.

59,109. When did the advantage of the large spat in 1858 begin to manifest itself in an increased quantity of oysters supplied to the market?—About two years ago, and this year and last year also; we have since that time been receiving the profits of it.

59,110. Have the oyster grounds here, excluding this year, been yielding largely, as compared with the yield in previous years?—No, they have been decreasing in the quantity of oysters for the last two years.

59,111. Has the number of men engaged in the oyster fisheries—the dredgermen—increased or diminished since you became water bailiff?—It has increased very largely since I have been water bailiff. When I was first appointed there were only 280 dredgermen, and now there are 407; that was the number of licensed dredgermen last February.

59,112. Have they increased equally in their prosperity?—Are they making as good a trade of it as they did when you began your work as water bailiff?—I think the oyster trade is generally better now, on account of the higher prices which the oysters fetch.

59,113. But not on account of there being an increased quantity?—No, the quantity has fallen off.

59,114. Do you think that the river has been more carefully cultivated for oysters of recent years?—Yes, the ground of recent years has been well managed and well cultivated in every respect.

59,115. Have you any artificial system of cultivation here?—No, we are not so foolish as to attempt that.

59,116. What care do you employ in endeavouring to increase the yield of oysters?—We work the river and keep it clear by dredging.

59,117. Do you not lay down brood in certain places?—No, we have not bought any brood for 10 or 12 years.

59,118. Have you sold any?—No, we never sell brood here, in point of fact we are not allowed to do so, as we are obliged to keep up a certain size, which is two and a quarter inches in diameter. Any oysters below that size are not allowed to be taken at all.

59,119. Then you do not allow any fishing for brood in the river at all, or permit any to be taken from the river?—We have a preserve down the river, where we lay down the brood. We take them from one place and another and lay them down at Pipelet.

59,120. Is there any good spat ground outside the river, on the banks in the neighbourhood?—Yes, there is a very good spat ground outside the river.

59,121. Do you not take the brood from that ground and lay it down in the river?—Sometimes we have bought some, but not lately. People who have their private grounds buy it.

59,122. Has there been none to buy of late?—No.

59,123. Could you not have obtained it, even if you had had a desire to buy it?—No, we could only have got very little.

59,124. Is there plenty of room in the river to lay it down, if you were able to get it?—Yes, there is plenty of room in the river.

59,125. Then you might have increased the quantity of oysters materially, if you could have obtained brood for the purpose of laying down?—No, we should have done no good with it.

59,126. Would it not have been of advantage if you could have obtained the brood?—No, we could not get it; there was none to be had.

59,127. It was not to be had at all?—No, not anywhere.

59,128. Were you able to obtain none off the coast at all?—No, nowhere.

59,129. Not any from a distance?—No, it has been the same at Jersey, and everywhere else. There has been no brood anywhere.

59,130. Then you know of no means by which you can increase the quantity of oysters here, except nature gives you a good spat?—If nature will only give us a good spat, we have nature's carpet here spread out for it.

59,131. In the course of your experience, have you discovered any means by which you think it probable that an increase in the supply of oysters might be occasioned? Is there any means by which you can utilize the ground here and increase the supply?—I cannot tell of any means, except there is a good spat. Last year, unfortunately, the spring set in cold, and if we get cold weather in May and June it is fatal to the spat. That is my opinion about it.

59,132. In what months of the year do you generally look for spat?—At the latter end of June—in June or July.

59,133. Is it regular in June and July?—Yes, I have seen it on the 16th June; everything was covered with spat; it was just like pepper; every oyster was quite covered on the 16th June with very small spat.

59,134. Was that a good spat year?—Yes, splendid.

59,135. Is it generally a good spat year when you have an early spat?—Yes, I think so.

59,136. Is it at all attributable to warm weather or the state of the water?—Yes, we require to have the water at a certain heat in June.

59,137. The water?—Yes, it is necessary to have the water at a certain temperature, in order to mature the spat. The spawn floats about until it obtains a certain consistency, and then it sinks.

59,138. Is it generally the case that a warm season is the most favourable for spat?—Yes.

59,139. And if there is an early spat it is in consequence of a warm season?—Yes, but sometimes we have an autumn spat.

59,140. In what interval of years do you have a good spat, does it come regularly?—No, we have generally five, six, seven, or eight years between.

59,141. Does it sometimes come every year?—Yes.

59,142. In a good spat season will there be such a supply that there will be far more oysters than sufficient to stock all the grounds?—Yes.

59,143. Is there any means by which you can preserve that supply for years in which you have a deficient spat?—Yes, by care; we have to take care of it.

59,144. What care do you take?—Sometimes we put the oysters into pits on the marshes. We have pits dug for the oysters, and then we remove them to different places where we know they will live.

59,145. Where they live and gradually grow?—Yes.

59,146. Do you remove the brood in the next year?—No, not until they get to a certain state of maturity.

59,147. How long does it take before you think it safe to move them?—We lay the brood down in November, and take it up again in March, and put it on the oyster beds.

59,148. You spread it over the oyster beds?—Yes.

59,149. When you have a good spat year, do you prepare for a succeeding crop of oysters?—Yes.

59,150. You always have done so?—Yes, that has been the custom.

59,151. In other years which are unfavourable, does not the spat come to brood?—In some seasons there is no spat at all.

59,152. Do not the oysters spat every year?—Yes, I know they do. We can see it.

59,153. Then what becomes of the spat?—We can not tell,—no one can tell.

59,154. Does it disappear?—Yes. I was many years concerned with spat for Mr. Carlisle of Cambridge. There were several experiments made with it, until at last he said, he could not tell me anything at all about it. I tried various experiments by his advice, but nothing come of them.

59,155. It is only when the season is favourable for the growth of the spat into brood that you are able to

obtain it for your oyster beds?—We are entirely dependent upon nature.

59,156. Do you think that you cannot assist nature?—Yes, I think we cannot.

59,157. Except by laying down the brood in the way you have mentioned, in pits?—Yes, in order to preserve it.

59,158. You cannot do that if the spat does not come to brood at all?—No.

59,159. And in certain seasons it does not come to brood?—No, it does not live. I could give you several instances, if necessary.

59,160. It does not mature sufficiently to become brood?—No; in Horne Bay I have known many large spats, and we have taken a large quantity from there, and in the next spring all has been killed by the five-fingers. I have known, on three different occasions, three different spats served in that way.

59,161. Is there any ground on the coast here which is favourable for spat?—Yes.

59,162. Will you describe to us where it is?—It is in the Blackwater.

59,163. Then it is not in the open sea?—No, it is the river just off this.

59,164. Here (*pointing to the chart*) are the Dengie Flats; is there any of the ground there that is good ground for spat, or any of the grounds just outside the Blackwater?—There is spat there at times.

59,165. Is there any good spat ground in the open sea down east of Brightlingsea, taking it from the point of land?—No.

59,166. Do you find that the spat succeeds best when it is within the mouth of the river, and not in the open sea?—It will succeed anywhere. I have known spat all round this coast, and all down on the north coast.

59,167. Is there any part of the coast where spat or brood is taken up for sale at present?—No, there is none to be had. Six years ago we could buy very nice brood at 6*s.* a wash, and now we cannot buy it for a sovereign.

59,168. Will you describe the ground in the Colne where the oyster beds are now situated?—From Aldborough Point to Colne Point.

59,169. Is the ground all cultivated?—Yes, we remove our stock to Pipelet,—that is our preserve. The oysters are taken from there in the spring, and brought up here to be laid down. They are caught in the winter to supply the market with.

59,170. The red mark on the chart comes to where the oyster beds are, at Pipelet Channel?—Yes.

59,171. Are not the oysters cultivated further up than that?—No, there is only a narrow and muddy creek beyond that.

59,172. How do you keep the ground clean?—By working over it.

59,173. By dredging it?—Yes, there are 300 or 400 men at work there nearly every day in the season.

59,174. During the season you are dredging the oysters?—Yes.

59,175. During the close time for oysters do you work on that ground?—No, the fisheries are generally closed in July, and opened in August.

59,176. Do you fish the ground in all months of the year, except July and August?—No, we shall leave off fishing now very shortly. In the month of April they fish up there (*pointing to the chart*), and bring oysters from there to this place, where they leave them to mature until next season.

59,177. Are the oysters you get on that ground natives of the best quality?—Yes.

59,178. And they bring the best price in the London market?—Yes.

59,179. Have you ever brought oysters from a distance?—Yes.

59,180. From the Channel Islands, or outside the river here?—Yes, years ago.

59,181. Do you not do it now?—No, we have not done it for the last 10 years.

59,182. For what reason? Was it that it did not answer?—No; we always lost money by buying oysters.

59,183. Do you find that the oysters change their character at all,—I mean the oysters brought from the deep sea and laid down in the river?—If they fatten, they do improve and become better.

59,184. You have not found it profitable to continue that system?—No.

59,185. You do not do it at all now?—No.

59,186. (*Mr. Lefevre.*) Do you find oysters over the whole of that ground marked red on the chart?—Yes, all over there.

59,187. All over it?—Yes, we can get a few all over it.

59,188. Are there any portions of that ground on which you find them in great abundance?—They are taken from there and laid down at Pipelet.

59,189. Do you find that portion of ground far up the river the best for fattening?—No, Pipelet is the best place,—up as far as it is marked red.

59,190. In the good season for spat, do you find the spat all over the ground?—Yes, we find spat everywhere in large quantities.

59,191. Do you in some seasons find the spat laid lower down when you do not find it in the upper part of the river?—No, if we get it in one place, we get it in another.

59,192. In a good season for spat, do you ever have a good supply of spat outside and none in the river, or do you have a good supply of spat in the river and not outside?—It is generally the case that we get it in the river, and get it outside also.

59,193. Do you ever find the spat outside the river when there is none inside?—No.

59,194. You have never known that?—No.

59,195. I think you said that the close season began in May?—The oyster season closes on the 12th of May, but we do not often have sufficient to carry it on until that time.

59,196. How long do you go on generally?—We commence in the latter part of August, and leave off when we have sold the lot.

59,197. Is there much difference year by year as to the day on which you close the close season? Do the dredgermen fix the time every year?—No, the Corporation come down and close the fishing. They ask the Company first what day would suit them. It is a mere ceremony that is gone through.

59,198. Is there much difference in different years?—Sometimes it is in July, and sometimes I have known it take place in August.

59,199. What is it regulated by?—By a proclamation.

59,200. But is it with reference to the fatness of the oyster?—No, it is a mere ceremony, that is all.

59,201. It is a mere matter of convenience?—Yes.

59,202. What do the dredgermen do during the close season? Are they engaged in dredging elsewhere?—They have to do as they can. We have 110 smacks, and they are insured for half their value at 18,000*l.* All of them are employed in the deep-sea fisheries.

59,203. Are they all the property of the dredgermen?—Yes, they belong to this place. They are large smacks, that can go where they please. They are insured for 18,000*l.*, which represents 36,000*l.* as their full value. They go away at this time of the year; but if they were allowed to go out in May and June, I think it would decrease the price of oysters to the public, and be a great benefit to the fishermen.

59,204. What is the complaint? Is it that they are not allowed to dredge in the Channel in the summer?—Yes.

59,205. Is that on account of the Convention Act?—Yes.

59,206. Do not your dredgermen get a licence to dredge in the mouth of the Thames outside your grounds?—They do dredge.

59,207. During the close season?—Yes. I have

BRIGHTLINGSEA.

E. Stammers.

1 March 1865.

been to the Board of Trade in reference to the matter, and they have drawn a line across from the North Foreland to Dunkirk. Upon the last occasion that I went to the Board of Trade, Mr. Henley, who was then President of the Board of Trade, told us that on this side we were free from the Convention.

59,208. Where does that line run from?—From the North Foreland to Dunkirk.

59,209–13. Do your men, in point of fact, dredge in the close season north of that line?—Yes, we consider that we have a right to do so, and we have an action in the matter pending now. We gave a challenge to the Government to send a vessel out against us.

59,214. I thought you said that they have power to dredge in the North Sea?—It has not been tried yet.

59,215. Is there not a form of licence granted by the Board of Trade or the Customs which enables the fishermen to dredge on the flats during the open season?—They always are licensed, but they are not allowed to dredge during those months.

59,216. Are they not allowed to dredge for spat on certain portions of ground called the flats?—Yes, all round the coast, within three miles of the coast.

59,217. But not outside the three-mile limit?—No.

59,218. During a good spat season, is a good deal of the time of the fishermen taken up in dredging for brood on this ground?—Yes, that is their sole employment.

59,219. That has fallen off during the last three years, in consequence of there being no spat?—Yes, there has been no spat for the last five years.

59,220. During the open season, is the whole of the time of the fishermen taken up in dredging in the Colne?—No.

59,221. How much of their time is so occupied?—There are only a small number of licensed men employed there. There are about 270 licensed dredgermen in this parish, and there is a population of upwards of 3,000.

59,222. I thought you said there were upwards of 400 licensed dredgermen?—So there are, but they do not all live in this parish.

59,223. Are they all engaged in dredging in the river Colne during the season?—Yes, all the men are; but there are some who receive a portion of the profits of the Company who are widows.

59,224. Is there any limit to the quantity of oysters that may be taken out of the river?—Yes.

59,225. How is that arranged?—It is done by stint.

59,226. What is that?—When they go to work, the foreman states the quantity of oysters he wants caught. He says, "catch so and so," one wash, two wash, or three wash, as the case may be.

59,227. Then is the catch regulated by the foreman and the jurymen?—Not by the jurymen, but by the foreman of the Company.

59,228. Is it done after a consultation with the jurymen?—If the trade sends an order for 300 or 400 bushels, the foreman will tell the men to catch two wash or more, according to the quantity required.

59,229. The oysters caught in that way go into a common stock, and are sold by the officers of the Company?—Yes, they are sold by the foreman.

59,230. He divides the produce among the fishermen?—Yes, so much a wash is paid, and the rest goes into the common exchequer to pay different expenses.

59,231. Is any surplus that may be left divided amongst the dredgermen?—Yes, when there is a profit.

59,232. I suppose the price paid for dredging each stint varies from year to year?—Yes.

59,233. According to the scarcity of oysters?—Yes, and the quantity caught.

59,234. I presume that the quantity of oysters which the foreman orders the dredgermen to dredge up is regulated by the quantity of oysters he knows to be in the river?—No, it is regulated by the demand.

59,235. Take the present year, when you have not had any spat for six years, I suppose the supply is rather small?—Yes.

59,236. Then would he not limit the quantity of oysters to be sent to the market?—They have to go three days now for a wash.

59,237. Does the foreman regulate the take with reference to the scarcity of the oysters with the view of keeping oysters for the purpose of breeding?—No.

59,238. You do not think it is necessary to keep a supply in the river for the purpose of breeding?—We always have a supply, if they will breed.

59,239. But could not they all be dredged up by the fishermen?—No, we are under certain rules. We dare not do that. We cannot take oysters below a certain size.

59,240. But after a want of spat extending over six years, I suppose the oysters are almost all of the same size?—Yes, nearly so.

59,241. What regulation have you to prevent all the oysters being dredged out of the river?—We have no wish to do it. We want some for another year.

59,242. How does the foreman regulate it?—He is bound by the jury. They give him certain orders to work in certain places. He is not allowed to go down below a certain place. All up here (*pointing to the chart*) is our stock ground. No one is allowed to go there.

59,243. Then may I take it that the jurymen regulate the quantity to be sent to the market, and to be dredged by the dredgermen, with reference to the supply that there is in the river?—No, it is not that.

59,244. Is it only regulated by the demand in the market?—Yes, it is according to the demand in the market. If you wanted a wash to be caught, he would order a wash, and if two were wanted, he would order two.

59,245. During the close season, you also employ men in removing oysters from one part of the river to another?—Yes. We commence in April, and we remove them from one part of the river to another.

59,246. How do you pay the men on that occasion?—About 5*s.* a day.

59,247. Do you pay them according to the work done?—Yes.

59,248. Do you pay any fishermen who choose to work at it?—No, only the licensed dredgermen or their apprentices.

59,249. How many apprentices is each dredgerman allowed to have, or is he limited at all as to number?—He is limited.

59,250. May each dredgerman have one?—Yes, if he is the owner of a boat.

59,251. How many dredger boats are there?—About 100.

59,252. So that the number of apprentices is somewhat limited in that respect, by each owner of a boat alone being able to have an apprentice?—Yes. There were 407 licensed dredgermen on the last court day.

59,253. During the close season, I think you said that the dredgermen go outside, and dredge for brood and spat within three miles of the coast?—Yes.

59,254. Do they take up in the dredges a considerable quantity of large oysters during that time?—No.

59,255. Has the ground been so cleaned of large oysters that there are none there at all?—No. The men often haul a dredge perhaps five times for oysters without finding a single one.

59,256. When there has been a good brood for two or three years, and the fishermen have been dredging on that ground for brood, do they take up any large oysters?—No, there are no large oysters at all.

59,257. From what oysters does the brood come? Is it from oysters that have been left on the ground?—I cannot tell.

59,258. Do you think it possible that the ground outside may have been so exhausted, that there have not been parent oysters enough left upon it to supply spat for brood?—It was always the case during my time. The supply of brood to be found there has always fluctuated. Sometimes there is a considerable quantity to be found, and sometimes none at all.

59,259. You say that the ground has been so cleared that there have been no large oysters left there. If that is so, where does the spat come from?—I cannot tell.

59,260. Do you think it impossible that the ground can have been so cleared of oysters as not to leave enough of the parent stock there to supply spat for brood?—My opinion is, that five oysters could stock our river with spat if all the spat from them was to live. I suppose they would yield eight or nine millions each.

59,261. Do you think that the spat found upon the flats outside is the produce of oysters laid down in your river which has drifted with the tide in that direction?—Yes, I have often thought so. It has always been my opinion that the common grounds have been stocked from the private grounds.

59,262. Or do you think that the brood which you have found there has at any time been the produce of a few oysters left on the ground which have escaped the dredging?—No, I think that it comes from the private grounds.

59,263. Is there a considerable extent of the ground outside on which the fishermen find the spat and brood?—Yes.

59,264. Where is it?—There is all the Blackwater. I have known a considerable quantity of spat found there, and also in the Swin.

59,265. Does this map now before us fairly represent the ground on which you find the spat and brood?—I think it does.

59,266. Is there any other ground besides that further out?—In some years we have the spat everywhere. We find it all along the coast, and all over the ground outside.

59,267. What is the nature of the bottom of the sea there; is it gravelly?—It is composed of shells and stones, and sand, and so on.

59,268. Is there any dredging carried on there for copperas stones?—They dredge lower down for copperas stones.

59,269. Do the fishermen ever find spat where the copperas stones are obtained?—Yes.

59,270. Does the spat adhere to the copperas stones?—Yes, it will adhere to anything.

59,271. Then do you think any damage has been done to the oysters by removing the copperas stones?—No, I think not.

59,272. Is there plenty of culsh to which the spat can adhere?—Yes, there is plenty of stuff for it to adhere to.

59,273. What is the nature of the bottom of your own river?—It is chiefly mud and clean shells.

59,274. Is the regulation about removing the culsh strictly observed?—We do not remove it, only for the purpose of making improvements. During this time of the year some of the larger culsh may be taken away and placed upon another part of the ground, in order to improve the ground itself.

59,275. Is the object of removing it, that it may receive the spat which is to come?—Yes.

59,276. Is there not a good deal of your ground that might be used for fattening oysters?—No, I think it is all used that can be used.

59,277. Then you do not think that any good could be done by vesting in the Company greater powers of borrowing money?—No, decidedly not.

59,278. Do you think that your ground is at the present moment turned to the greatest use that can be made of it?—Yes, we have at this place nature's carpet spread out for us, if a good spat only comes.

59,279. With the exception of the removal of the oysters from one part of the ground to another, is there no dredging carried on during the close season for the purpose of cleaning the ground?—No, there is no dredging after the close season once sets in, until the season becomes open again.

59,280. Would it not be of advantage to you to dredge for the purpose of cleaning the ground during the close season?—No, if it could be of any advantage to us we should have done so long before this.

59,281. At what time of the year is it that no dredging at all takes place on your ground?—Generally about the end of April, and from then to the latter part of August.

59,282. That is a period of nearly four months?—Yes.

59,283. Is there any deposit of mud or weeds on your beds?—Not during the summer season, but we get it after a hard winter.

59,284. You do not think any disadvantage arises to your ground in consequence of its not being dredged upon during those four months?—No.

59,285. You are aware that upon other private beds they are dredging all the year round?—No, I think they are not.

59,286. Take the Whitstable beds, for instance; they dredge there all the year round?—No, they do not.

59,287. They do not dredge for oysters, but they dredge for the purpose of cleaning the ground?—They are generally later than we are. I do not suppose that they finish shifting their stock until the end of June, or the beginning of July. Theirs is a more extensive business than ours.

59,288. They told us at Whitstable, that they are constantly dredging over the beds during the close season in order to clean the ground, and for the purpose of removing the oysters from one part to another?—Perhaps so; the same as I just described.

59,289. I understand that you only occupy a certain portion of the close months in doing that, while they go on dredging the whole of the year?—No, they do not.

59,290. (*Mr. Caird.*) Do I understand that during the close time you do work the grounds on which the oysters are?—No, we do not, as a general rule, but if they require it, then we do.

59,291. You do not find it necessary to work over the ground regularly during the close season?—If there are five-fingers, or anything of that kind, the watchmen who are employed to watch the grounds would at once go to work in clearing them away, and the foreman would have discretion to appoint other people to go to work, if necessary.

59,292. Is there no deposit of mud that makes it necessary that the ground should be constantly dredged during the summer season?—No, there is not.

59,293. (*Mr. Lefevre.*) If the foreman perceives five-fingers upon the ground, does he send out the dredgermen?—He can, if he likes.

59,294. Do you think that dredging during the spatting season is a bad thing for the young oysters, or not?—No; I think it is beneficial rather than injurious.

59,295. In what way is it beneficial?—By keeping them moving about.

59,296. Then you do not think that any harm is done to the young spat by the process?—No.

59,297. Do you think that the spat is so small that it practically escapes all injury?—No, I do not believe in that theory at all. The Blackwater is worked during the whole of the year round, and I have seen an enormous spat there.

59,298. Then do you not think that working on the ground when the spat has fallen has interfered with the supply of oysters afterwards?—No; I believe it is beneficial.

59,299. In what way is it beneficial?—It keeps the ground clean.

59,300. Then no harm would be done by allowing dredging to be carried on upon the open ground?—

BRIGHTLINGSEA.

E. Stummers.

11 March 1865.

No; on the contrary, I believe it would destroy the enemies of the oyster. For instance, the five-fingers will suck them off as fast as they come, if they are not destroyed.

59,301. What would be the effect if the provisions of the Convention Act were carried into force on the common grounds off this coast?—It would be beneficial, if we had two months more for dredging, namely, May and June.

59,302. What I mean is this, would it be detrimental to the interests of the dredgermen here, if the provision of the Convention Act was carried out, prohibiting dredging during the close time beyond three miles from the coast?—Yes, it would be fatal; we should be able, in that case, to get no stock at all. There would be no oysters to be got at all, if that regulation were carried out to the letter.

59,303. There would be no stock?—No; there would be no oysters whatever.

59,304. Will you explain that?—The oysters will not mature on the grounds outside. We have to get them, and place them on our private grounds.

59,305. The Colne Company does not buy any of the brood?—No; but it is sold to others who have private grounds.

59,306. Then may I take it that a great deal of your profit is made by selling the brood, which you get outside, to private companies?—Yes, and also to individuals.

59,307. Do you think that if the trade were interfered with it would be very detrimental to the interests of the fishermen here?—Yes, I am certain that it would.

59,308. You do not think that any prospect of an addition to the stock of oysters, by allowing the beds outside to remain unworked during the close time, will make up for the injury?—No, I do not.

59,309. Then will you explain to me why it is that you practically lay down a different rule for your own grounds from that which you lay down for the public grounds? Upon your own grounds you prohibit dredging, and do not allow the young oysters to be removed; but upon the open grounds you think it would be detrimental to the fishermen if they were prohibited from dredging during the close time?—It would not be detrimental to remove the young oysters from one place to another on our grounds during the close time. On the contrary, it is of benefit to our stock to remove them from the Colne up to Pipelet. If we did not buy our common stock during the summer months, we should not have any.

59,310. (*Mr. Caird.*) I thought you said, in answer to a question of mine, that you did not bring any stock from outside, to place upon your grounds?—The stock I refer to is laid down upon private grounds.

59,311. Then you make a distinction between private grounds and the Company's grounds?—Yes.

59,312. Where are the private grounds you allude to; will you point them out on the chart?—They lie here (*pointing to the chart*); these are all private grounds, belonging to the lords of the manor, and are in the hands of private individuals. They are about 80 yards each in extent.

59,313. Not more than that?—No.

59,314. And they obtain their stock from you?—Yes; they get the stock which we obtain on the outside during the summer months, and they deposit them there on those private beds. They take them up in November. They generally put them in pits on the marshes, in order that they may mature.

59,315. Is it a breeding ground?—No, a feeding ground.

59,316. Are oysters also got from those private grounds, and sent to the London market?—Yes.

59,317. There is a difference in the mode of managing those private grounds, as compared with that adopted upon the public grounds?—Each person manages his own ground as he pleases.

59,318. They adopt a different system to that which is adopted on the Company's ground? You say that they bring the brood from the outside, and lay it down upon the private grounds?—Yes.

59,319. But I understand that that is not done on the private grounds?—It is not done on the ground belonging to the Colne Company. We have done so in former years, but it is not the practice now.

59,320. If it is found profitable by private individuals to carry stock to these private grounds, would it not also be found profitable to do the same thing upon the ground belonging to the Colne Company?—No, it cannot be done there.

59,321. Will you explain the reason why it cannot be done?—On account of the expense.

59,322. Will you explain what you mean by that? Would it be of more expense to do it on the Colne ground than upon the private grounds?—Yes, the expense would be tenfold.

59,323. How does it arise?—The Colne Company is a very large body. Every man would expect a share of the money to be earned in that way, and it would involve a large expenditure of money; whereas in regard to the private grounds, an individual can obtain all that is necessary for them for laying upon his grounds by the expenditure of a very small sum of money.

59,324. Then am I to understand from that, that where individuals have their own interests to attend to they are able to adopt means for increasing the supply of oysters, but that in reference to the public grounds, the purse being a public purse, the same individual enterprise is not brought to bear?—Oh, yes, it is.

59,325. Is there anything in the nature of the ground belonging to the Colne Company which would make it different from the private grounds up St. Osyth's Channel, and render it less adapted for increasing the supply of oysters?—Yes, there is.

59,326. What is it?—We do not want to buy anything for stocking the Colne ground, because when there is a spat we always have the lion's share of it.

59,327. But those who have private grounds continue to supply their grounds with brood when you do not do it?—We cannot do so, because we cannot buy any.

59,328. But you have told us that those who are interested in the private grounds do buy brood from outside for the purpose of laying down on those grounds at the present moment?—Yes, they do so when they can, but there is none to be had now.

59,329. Would not the parties who are interested in the Colne grounds do so equally with those who have the private grounds?—Of course they would. There is nothing to prevent them, if they choose.

59,330. But at the same time they do not do it?—No, they do not.

59,331. Why do they not do it?—It would not pay them to do it.

59,332. Why would it not pay them?—Because the expense would be too much in moving the whole body of men belonging to the Company about, so that they should have their share of the money earned.

59,333. You mean that the body of men is so large that the collective interest would be difficult to meet?—Yes.

59,334. There is nothing in the character of the ground which prevents it from being done?—No.

59,335. It is quite practicable for the same plan to be carried out in reference to the ground belonging to the Colne Company, as in reference to the private grounds?—Yes, quite so.

59,336. (*Mr. Lefevre.*) Is it not to some extent the difficulty of raising money and repaying it that interferes in the matter?—Of course, that is the difficulty.

59,337. (*Mr. Caird.*) If the Colne grounds were in private hands, do you think you would be able to increase the supply of oysters more than you do at present?—No, we should not be able to do that.

59,338. Do you find that the private grounds are better adapted for laying down oysters ?—Yes.

59,339. Is there a greater depth of water on the Colne grounds than upon the private grounds to which you have referred ?—Yes, most of the grounds in the creek are dry at low water. We can walk over them.

59,340. Are grounds that are dry at low water more prolific of oysters than those which always have water upon them ?—No, they would not breed oysters, but we buy oysters for the purpose of laying down upon them.

59,341. The grounds that are dry at low water ?—Yes.

59,342. Then they are not breeding grounds at all ?—No.

59,343. Are you able to say whether they are profitable grounds ?—I cannot say that they do much.

59,344. I think you stated that you fish your grounds according as the order may be given by the foreman ?—Yes, we fish the Colne.

59,345. According to the order you get from the foreman ?—Yes, according to his order, and that depends upon the demand.

59,346. Has the demand for oysters upon this coast gone on increasing ?—Yes.

59,347. Has it increased in recent years ?—Yes.

59,348. Have you always been able to supply the demand as it increases ?—No, not this year; we cannot supply it now.

59,349. You stated, in answer to a question put to you, that whenever the foreman receives an order, you endeavour to fulfil that order by fishing the ground to the extent he desires ?—Yes.

59,350. Has it ever happened that you have not been able to fulfil an order ?—Yes.

59,351. At the present time ?—Yes, I have known it happen repeatedly, but sometimes we have more than is sufficient for the demand.

59,352. Have you always worked for them when you have had an order ?—Yes.

59,353. Has that been the case lately ?—It happened one season; it happened three years ago. It is when they are not fished.

59,354. What do you mean by not fished ?—They are not marketable or good.

59,355. You said that 110 smacks are engaged in the deep-sea fishing here ?—Yes.

59,356. What description of fish do they fish ?—Oysters and sprats.

59,357. Are the sprats caught by the stow-boats ?—Yes.

59,358. Are the stow-boats chiefly used in the sprat-fishing ?—They are for the sprat-fishing.

59,359. At what time of the year is the sprat-fishing followed ?—It commences in November.

59,360. How long is it continued ?—Up to now.

59,361. Has it increased or diminished of late years ?—This year has been the best I have ever known. I was stow-boating for 10 years, and there were no fish then.

59,362. How many boats are engaged here in stow-boating now ?—About 60, I think.

59,363. Is it a fishery that is increasing ?—It has increased this year.

59,364. Has it increased much ?—Yes to a very great extent.

59,365. You said it was a great hardship that the smacks could not go to the oyster-fishing in the deep sea in the quieter months of April and May, but that they were obliged to go in another season ?—They do not go in May and June.

59,366. That is the close time ?—Yes.

59,367. Do you think it would be a great advantage, if the boats were permitted to go then ?—Yes, decidedly.

59,368. Would you have a sale for the oysters then ?—Yes, they are in a better condition than they are in now.

59,369. The deep-sea oysters ?—Yes; they do not spawn until about July and August.

59,370. Would you put them on your grounds to feed, or send them direct to the market ?—We have a large quantity on our private beds.

59,371. Would you lay all those oysters on your private beds ?—Yes.

59,372. Would they then get into condition for the London market ?—Yes.

59,373. Would it contribute very much to the prosperity of the fishermen here, if such a licence were given ?—Yes.

59,374. That would be the case if the deep-sea fishing for oysters were extended to the months of May and June ?—Yes.

59,375. Do they not go out now ?—They go out somewhere, but they only get a few.

59,376. Do not some of the boats on this coast go off the French grounds opposite Shoreham, to fish during the summer season ?—I do not know.

59,377. Do none of your boats go to the south of the Foreland to fish for oysters during the summer season ?—I believe that some do so, because they have been taken by the cutters; that is evidence that some go, but I do not know where they go to.

59,378. (*Mr. Lefevre.*) What are the private beds you were speaking of just now ? Are they parts of the Colne ground ?—No, they belong to the lords of the manor and private individuals.

59,379. You do not allow members of your own body to mark out grounds for themselves ?—No, they are hired the same as a man hires a farm.

59,380. You do not set apart your ground for that purpose ?—No.

59,381. The dredgermen go into the Channel, dredge up oysters, bring them here, and lay them down for the purpose of supplying the London market during the close season in May, June, and July ?—Yes, but they are only allowed to go out until April.

59,382. They are only allowed to dredge the oysters during the open season ?—Yes.

59,383. They bring them in and lay them down to supply the London market during the close season ?—Yes.

59,384. How long does that supply to the London market go on,—does it go on during May, June, July and August ?—Yes, if they were allowed to go in May and June there would be a greater supply.

59,385. Is the stock they are able to lay in during the close season not sufficient to last throughout the whole of the open season ?—No.

59,386. Do you supply the market with an abundance during May and June at present ?—No, I believe there is not a supply at all of any kind of oysters.

59,387. (*Mr. Caird.*) What do you mean by that ? I mean that there is not a sufficient supply.

59,388. (*Mr. Lefevre.*) They do their best to supply the market by laying up a stock in the open season ?—Yes they do their best, it is to their advantage to do so, and to get a supply.

59,389. Have you known many other occasions when you have had bad spat seasons ?—Yes.

59,390. Have you had bad spat seasons for several years together ?—In 1842 it was as bad as it is now.

59,391. For how many years together did you have a bad spat ?—I have known it on several occasions.

59,392. For several successive years ?—Yes, but but not for so long as at present.

59,393. A good spat will last you three or four years ?—We have had to make this last five or six years.

59,394. Is this the first year you have found your beds beginning to be exhausted ?—No, for the last five years they have been exhausted, and we have had to make the best of them we could; we have collected the oysters together as much as possible.

59,395. When you have had a good spat, and the ground has been covered with brood, have you found it of advantage to remove the brood to other parts of your ground ?—If we find spat on places where it would not live in the winter, we remove it.

BRIGHTLINGSEA.

E. Stammers.

11 March 1865.

59,396. Does it ever happen that the brood is in such abundance that it lies too thick on the ground, and it is an advantage to thin it?—We do so.

59,397. You remove enough to supply the beds for fattening?—Yes.

59,398. Does that leave more room for others to grow into large oysters?—We remove them up to a certain size.

59,399. (*Mr. Caird.*) You say that if you have a good spat this year, the result would not tell on the supply of oysters for the next two years?—No, not for three years to come.

59,400–2. Then the prospect of a scarcity of oysters for the next two years seems imminent?—Yes, I am quite certain of that.

59,403. At what age do you consider the oysters are fit for the market?—They are better at five years than they are at three.

59,404. I suppose you use them at three years?—Occasionally we use the largest.

59,405. (*Mr. Lefevre.*) What is the age of the oysters you are taking up now?—They are six years old, I think.

59,406. Have they begun to fall off from age? Is there any age at which they begin to fall off?—Yes, some of the old ones decrease in size.

59,407. At what age do you consider that that takes place?—I do not know. We have got some six or eight years old, that were small things not more than two inches across.

59,408. (*Mr. Caird.*) Have you ever fished oysters in the deep sea?—Yes, in the English Channel and in Jersey too.

59,409. Have you found it the case, that when you have had a bad spat in the shallow waters, you have also had a bad spat in the deep sea?—I have never observed that.

59,410. You cannot say whether it is so or not?—No.

59,411. Do you think it possible, if the fishermen were permitted to fish for oysters in the deep sea during the summer months, they might supply the deficiency which results from the bad spat in shallow waters?—I think so.

59,412. Is there any other way in which you imagine the deficiency is likely to be supplied?—No, there is not.

59,413. Is there any suggestion you can make to us as the result of your experience?—No, I cannot entertain the idea of breeding oysters by artificial means.

59,414. Is there no suggestion you can offer to us, from your long experience in connexion with the oyster fisheries, by which you think the supply might be increased?—No, except by granting those two months; I think that would increase the supply.

59,415. Two months extra for fishing in the deep sea?—Yes.

59,416. To what market do your oysters chiefly go?—Most of them go to Ostend.

59,417. Do you send none to London?—We do not send them directly to London, but persons come here to buy them for London.

59,418. Oyster merchants?—Yes, ours is like a wholesale shop. Persons come and take them of us, and they do as they please with them, but there are vessels that take them direct to Ostend and Dunkirk.

59,419. Is the largest part of the oysters caught here sent to foreign markets?—Yes, the largest part is sent to Ostend.

59,420. Is that a trade which has sprung up of recent years?—No, it has been established as long as I can remember.

59,421. Then has the Colne never at any time sent many of its oysters to London?—Yes, we used to have a salesman at London, but that is done away with now.

59,422. Do you find a better market in Ostend?—Yes, that is our best market.

59,423. Do you get a better price there?—No, but they go in larger quantities, and the money is always safe. There is also less expense attending them.

59,424. (*Mr. Lefevre.*) Does the foreman of the Company sell all the oysters taken in the Colne?—He superintends the selling of them.

59,425. Does he fix the price?—No, that is done by the jury of twelve. They meet once a month and manage that business.

59,426. They fix the price?—Yes.

59,427. Are those jurymen chosen out of the body of the dredgermen?—Yes.

59,428. By election?—I make a panel as water baliff, and put down 30 or 40 names, which I present to the town clerk. The names are all put in a hat, and the number drawn by ballot.

59,429. You choose the most intelligent among the fishermen?—Yes.

59,430. You make a panel of 20?—Yes, 20 or 30.

59,431. And the Corporation take 12 of them?—Yes.

59,432. (*Mr. Caird.*) Do the oysters from the private beds, also, chiefly find a market at Ostend?—No, they are principally sold to the Kentish Companies, but they have been sent occasionally to Ostend from the private beds.

59,433. Then the Colchester oysters really go very little to London?—A good many go, but the largest quantity goes to Ostend.

59,434. Is there an increasing quantity compared with what used to be sent a number of years ago?—No, there is a decrease, I believe, in the London trade, but an increase in the foreign trade.

59,435. (*Mr. Lefevre.*) Is there not something given to the widows of dredgermen?—They are licensed the same as dredgermen. They each have what is called a half stint. If a dredgerman earns 15*s.*, a widow gets 7*s.* 6*d.*

59,436. Without going out?—Yes.

59,437. Then it amounts to this, that a widow has a pension after the death of her husband equal to half the wages he would have earned?—Yes.

59,438. Can you tell us what have been the average earnings of the dredgermen in this Company?—No, I cannot. I do not keep any accounts whatever.

59,439. Can you give us any notion of what a dredgerman will earn?—Not in the least.

59,440. How long is it since you were a dredgerman yourself?—I am one now.

59,441. Are you actively engaged in dredging?—Yes, but I keep no accounts whatever.

The witness withdrew.

J. Barber.

JOHN BARBER called and examined.

59,442. (*Mr. Caird.*) Have you been long acquainted with the oyster fisheries here?—Yes, for 30 years.

59,443. Are you engaged also in the stow-boat fishery?—Yes.

59,444. Is there any other fishing practised here?—No, only deep-sea fishing.

59,445. Deep-sea fishing for what?—For oysters.

59,446. There is no deep-sea fishing practised here for any other kind of fish?—No; I believe there is not a trawlerman out of this piece.

59,447. You have heard the evidence which has been given to us by the previous witnesses?—Yes.

59,448. Is there any suggestion you can make to us in addition to what they have already stated?—I think not.

59,449. I suppose you agree with the previous witnesses, that the oyster fisheries are all, at the present moment, suffering very much in consequence of the deficient spat of the last six years?—Yes, and I should like to make a strong remark in reference to the time at which we are prohibited from going out

with the dredges. I think that that regulation is one of the most ridiculous regulations that could be established, and the fishermen have suffered very much from it. Indeed, they have suffered more from the interference of the Government, with regard to the deep-sea fishing, than you can possibly imagine.

59,450. What have you suffered from their interference?—First of all, it seems to us that the Government, so far as we can understand the matter, have a wish to increase the quantity of oysters supplied to the public, but in order to do so, they have established a regulation which closes the dredging to us for four months in the year.

59,451. The object of the Government is of course to endeavour to increase the supply of oysters for the general consumption of the public?—Yes, but we do not think they take a proper course to accomplish that object. In two of the months which are closed to us, the want of dredging, instead of being beneficial to the fisheries, is most disadvantageous.

59,452. What months are those?—The months of May and June. During those months the bottom of the sea, like the land, is covered all over with grass. That is in the spring time of the year, and if we were allowed to work with our dredges at that time we should do a great amount of good. We ought to be able to work up to July, that being about the time when the spat begins to fall. If the ground were kept clean up to that time, I think it would be most beneficial to the fisheries and would increase the quantity of oysters.

59,453. Do you think the oysters are in as good a condition in the months of May and June as they are in the months previous to that?—Yes, I think they are, and better too.

59,454. You think they are in a better condition?—Yes, I think the deep-sea oysters are.

59,455. Have you any certain knowledge of the growth of grass at the bottom of the sea in the months of May and June, and of the fact that it injures the oyster-beds?—Yes.

59,456. How do you know that?—There is not a year in which the ground has not been tried, and the dredgermen have hauled up so much muck and slush in the entrance of the dredge that nothing could go into it.

59,457. Where have you been in the habit of fishing in the deep sea?—From here to the Dudgeon, and at Jersey, and all along as far as the Humber. I have fished in every part of the deep sea.

59,458. Have you not fished in May and June?—Yes, we have done it, but it is contrary to the law.

59,459. Who interferes with you?—We are interfered with in a thousand ways, notwithstanding that we had a guarantee from the Board of Trade that we should not be interfered with. We had a chart marked out, showing the line where we could fish, and we were told that we should not be interfered with anywhere north of that line.

59,460. Is that a line drawn between the Foreland and Dunkirk?—Yes.

59,461. You were told that you were not to be interfered with north of that line?—Yes; but directly we went out to fish, a French cruiser came to us and took our vessel into Dunkirk, and the fishermen were obliged to go into the Channel, or anywhere they could, and fish contrary to the law.

59,462. Were you yourself fishing at the time the French cruiser seized some of the English vessels?—Yes.

59,463. Where were you fishing?—Right off Dunkirk.

59,464. Outside the line?—Yes.

59,465. What distance from the shore?—I think, according to the evidence of the French pilot, that it would be about six miles from the shore.

59,466. Where are the best fishing grounds for oysters in the deep sea?—There are oysters to be got all up and down the Channel.

59,467. Anywhere you put the dredge down can you light upon oysters?—No, not always.

59,468. Are there any grounds which you have ascertained to be good, and which you can go to knowing them to be good oyster grounds?—Yes, there are very good grounds for oysters midway between Brighton and Dieppe and Havre.

59,469. South of the Foreland?—Yes.

59,470. Do the French fishing boats come on that ground along with you?—Yes.

59,471. Then do the English and French boats fish together?—Yes.

59,472. Have you ever found the French boats fishing in the months of May and June?—No, but there is a reason for that.

59,473. What is the reason?—The reason is this. Their boats are adapted for other kinds of work, which comes in about that time, and I think it is from that fact that our Government here have been induced to borrow their bad laws. The French have made a law which just suits their purposes, and we have copied it although it is very injurious to us.

59,474. What do the French boats do at that time?—They go long-line fishing, and mackerel-fishing, and after all sorts of things. We have endeavoured to follow in the wake of the French fishermen, although they know no more about oyster-fishing than a stone. English dredging and French dredging are two very different things.

59,475. Do you not adopt the same style of fishing?—Decidedly not. A Frenchman will leave his dredge out, and take up small and large oysters and soil, and everything else. He takes it all up together, turns it into his vessel, and carries it away with him to the harbour. Now the English cull the oysters they take up in their dredges, and the little ones they do not require they throw back again into the water. Their dredging, therefore, has a tendency to cleanse the ground and to make a regular nice soil of it. Yet, notwithstanding the advantage of our own system over that of the French, we are asked to try and imitate the French.

59,476. I think you said just now that you have fished on the Jersey grounds?—Yes.

59,477. Are you aware that those grounds do not yield so well as they did formerly?—Yes.

59,478. Have you been in the habit of fishing those grounds frequently?—Yes.

59,479. Then what do you imagine is the reason that they have ceased to be as productive as they were formerly?—I believe the French steamer being there was the great cause of it. Before that time the fishing vessels could go out and work upon that ground, notwithstanding all the cutters that might be sent after them, but as soon as the steamer came that was all put an end to, both to the injury of the fishermen and of the oysters.

59,480. Do you think that working on the ground is of advantage to the oysters?—Yes, decidedly; I am of opinion that the more the ground is worked, the more likely it is to produce oysters.

59,481. Do you think that the want of working the ground permits the accumulation of the grass and other stuff of which you spoke just now?—Yes; and it is quite feasible that it should be so. Then again, the style of dredging adopted by the French boats prevents the spat from coming to perfection on the ground. They take away all that their dredge brings up, and they take it all into harbour and destroy the whole, both small and large.

59,482. (*Mr. Lefevre.*) When did the falling off in the supply of oysters on the Jersey ground begin?—I think about eight or nine years ago.

59,483. Was it immediately after the enforcement of the Act to which you have referred?—I think it began directly after the close time began to be enforced. It lingered on for a little while after that, but now the supply has failed altogether.

59,484. Did the falling off begin about that time?—Yes. There was also a large hole of oysters found in the Channel about that time, and everybody went to it. That hole helped to put an end to working on the Jersey ground, and very much injured the oysters.

BRIGHTLINGSEA.

J. Barber.

11 March 1865.

59,485. Was it found more profitable to dredge in the Channel than on the Jersey beds?—Yes.

59,486. Then, in consequence of the dredging not being carried on so extensively, did the weeds begin to grow and the dirt to accumulate, until the ground became spoilt?—Yes. The ground ought to be as clean as possible in the month of July, when the spat is about to fall.

59,487. You have observed that the ground has become more dirty?—Yes, you can see in a minute that the ground has not been meddled with.

59,488. Do the Frenchmen dredge up both large and small oysters?—Yes, and the soil, and everything else.

59,489. They do not cull the oysters?—No, not on the spot.

59,490. Then is it disadvantageous to the beds to take them away without culling them?—Yes; sometimes it is nearly all small that they take away. Some of them are not bigger than the top of this inkstand.

59,491. Do they lay them down on beds for fattening?—No.

59,492. I suppose they could lay them down on beds for the purpose of increasing their size and fattening. If they did that, would it be of any advantage?—They do not take the trouble to do it. All the small they take up in that way are spoilt. They are turned out with the dirt, and lie in great heaps in the harbour as big as a house.

59,493. Have you ever observed them throwing the small oysters away at Dunkirk?—No.

59,494. Are you sure that they do not lay them down on beds, in order that they may fatten?—No, only what the women cull out. The women take out the oysters they require, and those they deposit on their beds.

59,495. Are they small oysters?—Yes; small and large too, or such as they require.

59,496. They lay them down on beds, in order that they may fatten?—Yes.

59,497. Is there any demand on this coast for small oysters from the Channel, to lay down on beds to fatten?—We never fatten the small oysters, that is, if they are very small.

59,498. Have you never tried to do so?—We should be glad to do so. They would be worth almost any money, if we could find them, but I never heard of any small brood being found there.

59,499. Have you heard of small brood being found lately in the Channel?—No, not for the last six years.

59,500. Has there been the same want of spat in the Channel as there has been in the mouth of the Thames?—I do not doubt it.

59,501. Before the last six years, were you in the habit of taking up a considerable quantity of small oysters, as well as of large, in the Channel?—Yes.

59,502. Have you found that there has been a falling off in that respect of late?—Very few have been got lately.

59,503. Have you found no small oysters in the Channel lately?—Only very few.

59,504. Then do you think that there is also a falling off of the oysters in the Channel?—I have no doubt of it.

59,505. I think you said, that if you could get small oysters now for laying down they would be worth any money?—Yes.

59,506. Would you permit the take of small oysters in the Channel?—Yes.

59,507. Would you allow small oysters, below an inch in diameter, to be taken?—Yes; I would allow anything to be taken which we could lay down here to cultivate.

59,508. It would be an advantage to permit oysters of that size to be taken?—Yes; they would then be in the best state for culture that they could be in.

59,509. Are any means adopted for enforcing the Convention Act in the Channel?—They do take means, but they do not know much about it. They get into a dreadful state of confusion. I never saw such a mess as they are in about it.

59,510. Will you describe it?—The commander of one cutter will come on board a vessel, and say, "You ought only to have oysters of such a size;" another will say, "You ought not to have a dredge on board;" a third, that we ought not to be here; and the next, that we ought not to be there. Another one says we have no business to go to Burnham for oysters; and what with all these different opinions, we never know what we ought to do. In point of fact, the interference to which we are subjected here has regularly paralyzed our trade.

59,511. Have you ever been boarded by the French and English cruisers, in order that your oysters may be investigated?—Yes.

59,512. Have they thrown overboard a good many, when they have found them below a certain size?—No, I never remember that.

59,513. Then what harm have they done to you?—They have stopped our dredging altogether.

59,514. I suppose the men that they have stopped were dredging in the close time?—Yes.

59,515. But during the open time have you been inconvenienced?—No, I never knew anything done in that way, except at Jersey, and the interference there did not seem to do much good.

59,516. Have you yourself dredged much for spat on ground off the coast within the three-mile line?—Yes.

59,517. Do you agree with what the last witness told us about the falling off of spat?—Yes.

59,518. I want to hear from you your views about it. Do you think that a stock of oysters has been left on the ground to supply the ground with brood?—What ground do you refer to?

59,519. The public grounds outside?—No; but that has nothing to do with it. The men will go out working as long as they can earn sufficient money to satisfy them. If a man goes out to work for 2*s.* 6*d.* a day, and he can only manage to get 2*s.*, in all probability he will go somewhere else where he can get 2*s.* 6*d.*

59,520. Do you think that the young oysters found outside are the produce of private grounds, or of oysters left on the public grounds?—I think it would be impossible to take all the oysters from any ground.

59,521. Do you think it would be impossible to take away the oysters so clean that there would not be sufficient left to supply the ground hereafter?—Yes, there will always be enough left for that purpose.

59,522. You think that is the case?—Yes; because there have been times and seasons when I have known heavy falls of spat in places where there were not supposed to be oysters to any extent. For instance, at the Dudgeon, 25 years ago, there was a heavy fall of spat. Where did that come from? We never knew. Previous to that time there were no oysters in any quantity in that neighbourhood that we had any knowledge of.

59,523. Where is that ground?—Off Foulness, on the Norfolk coast. No doubt, there were a few oysters on the ground. As I have said before, I do not think it possible to catch every one of the oysters.

59,524. Were you dredging last summer for brood on ground off this coast?—Yes.

59,525. Did you find any at all?—Very few indeed. They were very scarce indeed.

59,526. Were there any large oysters amongst them?—What we did dredge were large. They are all six years old.

59,527. But there are very few of them?—Yes.

59,528. Do you think there are enough there to stock the ground with spat, in the event of a good season for spat coming?—I do not see any ground for fear on that matter.

59,529. You think that if a good year for spat came, the oysters on the ground, even though they were very scarce, would be sufficient to supply spat for brood?—I think that would be the case.

59,530. Is there a considerable extent of ground off the coast here on which you find spat?—Yes, there is a very extensive piece of ground.

59,531. What extent is it? How many miles long?—I think it will be 10 or 15 miles; it extends up to Harwich.

59,532. What is the breadth?—About two or three miles.

59,533. Then, what extent of oyster ground is there further south?—Oysters are found nearly everywhere. It would be next to impossible to tell where they are not to be found. They are found in nearly every spot lying between here and the French coast. Occasionally a very good hole of oysters is found in the Channel, and then all the people flock there after them.

59,534. How many boats are employed from this place in the deep-sea fishing?—110.

59,535. Are they all smacks capable of going into the Channel?—Yes, they could go anywhere.

59,536. How many men do they carry in each?—Six men.

59,537. Are they all dredgermen belonging to the Company here?—Not all of them.

59,538. How many oyster dredgermen are there here who are not members of the Company?—500 or 600.

59,539. 500 or 600 besides the Company?—Yes, perhaps there may be more than 600. I should say that there would be 700 or 800 here.

59,540. Are those men engaged in dredging oysters all the year round?—Yes, outside here in the sea.

59,541. I suppose that during the open season they go into the Channel?—Yes.

59,542. During the close season they are engaged in dredging up brood off here?—We do the best we can to get a living, but unfortunately the Government have taken so much advantage of us that our business has been almost paralyzed. We are obliged to act contrary to the law. If we did not, we should starve, or should have to seek some other mode of gaining a living.

59,543. What would be the effect, upon the men who do not belong to the Company, of carrying out the Convention Act on the coast off here?—All of them would perish. They have caught no oysters at all up to this time, and they have only a piece of a month to go through and a whole month next month. That is all they have for the year. Then there is another thing. It would cost me 30*s.* for work now which I could do in the month of May for not more than 15*s.*

59,544. Have your men gone dredging off Weymouth on the oyster beds there?—Yes, and off Falmouth too.

59,545. Have you dredged in Portland Bay?—Yes.

59,546. Do you know that the people there complain that the oyster dredgermen from the Thames carry away their oysters?—I think there are hardly half a dozen to be found there.

59,547. How many boats went from here to dredge on that ground?—Only two or three.

59,548. Did they take up the small oysters as well as the large?—There are no small and no large either. There were very few indeed to be found.

59,549. Do you lay down on private beds here the oysters you dredge during the open season in the Channel?—Yes.

59,550. In order to supply the London markets during June and July?—Yes.

59,551. How long does the supply to the London market go on?—As long as the oysters continue to hold good. As soon as they begin to turn sick, it is of no use sending them to the London markets, and we have to discontinue them. It would not answer to send them then.

59,552. Do the oysters that are sick remain on the ground until the following year to supply the market?—No, the sickness only lasts about a month.

59,553. Do you find, in point of fact, that the moment the oysters become sick the people in London refuse to take them?—Yes. And there is also this fact, that they would not live if we sent them. We cannot send them away from one place to another, because they would die.

59,554. When you have a stock of oysters to supply the London market during the close season, and you find them become sick, do you leave them there until the next season?—No, only until they get over their sickness.

59,555. And then you send them to the market again?—Yes.

59,556. (*Mr. Caird.*) Do the oysters here, according to the season, sometimes spawn later than at others?—Yes.

59,557. Did you notice last year whether any of the oysters spawned in the months of August and September?—No, they did not.

59,558. We had very warm weather in August and September last?—Yes, but it is best for us when we have a warm July. It has always been a kind of byword amongst the fishermen here, that if we have a particularly fine warm July we shall have a particularly good spawning season afterwards. I have noticed myself that in seasons when we have had wind or rain in July the oysters have fallen short in the spawning season.

59,559. A warm August will not make up for the want of a warm July?—No.

59,560. Do you, as a practical fisherman, think that in the deep sea the oysters spawn later or earlier than in shallow water?—I think they spawn much later.

59,561. Then when you lose the spawn from the want of a good season in July, might there not be a good season for spawning in the month of September in the deep sea?—Yes, that might be the case.

59,562. Then it does not necessarily follow that if you have a bad spawning season in the shallow water you cannot have a good season in the deep sea?—No, I cannot say anything to the contrary.

59,563. Then may not nature keep the supply pretty equal in that way?—It may.

59,564. Have you observed, while fishing in the deep sea, that you cannot make as good a fishing as you could six years ago?—No, I do not see much difference in that.

59,565. In fishing in the deep sea, have you noticed any falling off, as compared with former years, in the number of oysters you can take, leaving out of consideration the Jersey banks?—The sea is so extensive that it is impossible to know what there is in it. At the present time, when they find any particular spot in the Channel where there is a good supply of oysters, they go on working it, and do not try anywhere else.

59,566. Do you occasionally find a place that is very prolific?—We occasionally find one place better than another. I do not see that there has been any increase.

59,567. Has the supply in the Channel been decreasing?—Occasionally they get increased catches, and then they go on fishing that particular spot until it does not answer their purpose to remain there.

59,568. Do they then shift their ground?—They are continually shifting their ground. Another hole may be found in another place, and then they leave the ground they have been working and go to that.

59,569. Then is it not from any deficiency of spat that there has been a falling off in the deep sea?—No; we have not found that to be the case.

59,570. (*Mr. Lefevre.*) I thought that you told me you have not observed small oysters in the deep sea?—For the last six years I have not seen any quantity.

59,571. (*Mr. Caird.*) I believe you always lay your Channel oysters on your own ground before sending them to market?—Yes.

59,572. You never send them direct to the market?—No.

BRIGHTLINGSEA.

J. Barber.

11 March 1865.

59,573. Do they improve in quality, and get a better price, after they have been laid on your ground?—Yes; it makes a difference of fully half.

59,574. At Jersey, you say, the oysters have fallen off, since the steam cruiser came on the ground?—Yes.

59,575. The steam cruiser, I suppose, was more effective in maintaining the close time?—Yes, and the Frenchmen monopolize the fishing. They not only take up the biggest half of the ground, but they intimidate our fishermen from going on the other half.

59,576. I suppose the French cruiser was impartial in his treatment of the fishermen?—No; he protected the French fishermen, but not us.

59,577. Was that on the Jersey coast?—Yes; it is close to the French coast, and the line has been so divided there that the Frenchmen get all the oysters.

59,578. Then did not the steam cruiser prevent the French fishermen from fishing within their own line?—No.

59,579. Do the oysters on that ground still yield well?—There are no oysters there now, and there never will be on the Jersey ground, the same as there was formerly.

59,580. You say that the French cruiser permitted the French boats to fish within their own limits at the time they prevented you from fishing on the Jersey ground?—There are three miles reserved for each country; the fishing in the middle is free, and is public ground. What I said is that the French fishermen would not allow the English fishermen to go over to their side, and they intimidated them so that they were afraid to be within two or three miles of the limits.

59,581. Was the result of that that the French boats fished the ground when you did not?—Yes.

59,582. But you also said, that it is because the ground has not been fished that the fish have ceased to be found there?—I did not say that. I think it may have tended to produce that result, and I said I thought that was the beginning of it.

59,583. Does the French ground continue to yield, being continually fished?—No.

59,584. How is that?—It cannot continue to yield oysters, because the French dredgermen take everything away.

59,585. Then do you consider that it is over fished?—Yes. There are three miles of the coast on that side reserved for the French, and three miles on this side reserved for the English. Then, between those two lines, all in the middle is common ground, and wherever spat or brood is to be found the Frenchmen go with their dredges and sweep the whole away. There is no hope of there being a good fishery there again.

59,586. (*Mr. Lefevre.*) But you do that here, do you not?—No; there is an Act of Parliament against it.

59,587. I mean on the public grounds?—No; we use a thing like a knife, by means of which we pick out what we want, and we throw the rest back again into the sea.

59,588. I understood you to say that you take the small oysters?—Yes; but the French fishermen take away the soil and those things which the oysters adhere to. Outside here, a dredgerman might get his dredge full of culsh, which is just the thing for the spat to fall on. If there were nothing to prevent that, people would go and gather it up and carry it away.

59,589. Are the dredgermen compelled, when they are dredging on the ground off this coast, to throw the culsh back again?—Yes.

59,590. A regulation of that kind is observed generally?—Yes.

59,591. On the other hand, the French dredgermen do not observe that regulation within three miles of their own coast?—No, nor when they are on the common ground.

59,592. Do you think a good deal of damage has resulted to the fishing in consequence?—Yes; a good deal of damage has been occasioned by the mode in which the French fishing has been conducted.

59,593. Do you ever take your oysters into Ostend or Dunkirk at once?—No.

59,594. Do you think it would be an advantage, if you were able to take them there as a cargo?—Sometimes it would, when the wind and weather are bad. At present, we are not allowed to sell there, and, if the vessels cannot get away, we cannot sell oysters, unless it is for the purpose of buying food.

59,595. Are all the Channel oysters sold in the London market, or are they exported to France?—There is a great demand for oysters in France, which causes the oysters to go up to a high price. The Frenchmen have taken to eating common oysters, which they get from Newhaven, Shoreham, and so on.

59,596. Do you sell them to the French?—No. They are entirely for London and other markets here.

59,597. All the Channel oysters are used in supplying the English demand?—Yes.

59,598. Do the French obtain any brood from here, for the purpose of laying down on their own beds?—No, they never get any.

59,599. Is all the brood taken in the sea off this coast laid down on private beds here?—Yes.

59,600. Sold to the Whitstable Company, the Faversham Company, and private companies on this and the Kentish Coast?—Yes.

59,601. What private companies are there here besides the Colne Company?—They are too numerous to name.

59,602. Are there a great number of them?—Yes; I should say there are 100 small landowners who have private beds.

59,603. Are they engaged in buying the small brood?—Yes, and in cultivating oysters from the brood, until they become oysters fit for the market.

59,604. Do any of them possess ground on which they find brood themselves?—No, there is no such thing; it is entirely a process of cultivation which is carried on here. They buy all the brood they have.

59,605. Then, with the exception of the Colne Company, do none of them have ground on which the oysters spat?—No.

59,606. Where do these companies buy their brood from now?—They are adrift now. They have hardly been able to obtain any for a considerable time. Those who have been accustomed to obtain 500 bushels in a season, have not been able to get 50, and some of the smaller ones have not been able to get any at all.

59,607. Do they buy it from Falmouth and other places on the south coast?—They would do so, if there was any to sell, but I do not think there is any to sell, even there.

59,608. Then, with reference to the Convention Act, the alteration you suggest would be that the open time should be extended for two months?—Yes, if possible, or I do not know what will be the consequence this summer.

59,609. You do not think it would be desirable to do away with the close time altogether?—I think it is impossible that people can live for four months away from their business.

59,610. But you would not wish to see the whole of the year open time?—No, of course not.

59,611. Upon what ground?—Because, in the spawning time, the oysters, if we were to catch them, would not be good, and they would fetch no money.

59,612. But could you not lay them down?—Half of them would die, if we were to lay them down. Even in September we have to be very careful in getting them.

59,613. They require to be carefully attended to, even as late as that?—Yes.

59,614. The removal of the oysters would be attended by danger to them?—Yes, at that time.

59,615. (*Mr. Caird.*) In what month do you fish the Channel oysters now?—In every month of the year, except in the close months.

59,616. You are acquainted with the stow-boat fishing ?—Yes.

59,617. In what months of the year is that fishing practised ?—From November until February.

59,618. Has the quantity of sprats taken by the stow-boats been increasing of late years?—There have been very few got for a good many years until this winter. This year there has been an abundance.

59,619. Are they ever caught in such an abundance here as to be unsaleable, except for manure ?—No, there were a great many carried to the London market this winter.

59,620. Were there any sold for manure that could not find a market ?—Yes, when there is a necessity for it.

59,621. Were they found in such abundance ?—It was not through that, but on account of the time and the weather, and the day on which they were caught. For instance, it would be of no use to go to London with them for the Sunday. All that come in at a time like that would have to be sold for manure.

59,622. Do you ever find young herrings mixed up with them ?—No, it is a very rare thing indeed.

59,623. Are they almost all exclusively sprats ?—Yes, they are sprats as near as they can be.

59,624. Are there any regulations as to the mode in which the sprat fishery is to be followed here ?—No, it is quite a matter of perfect liberty.

59,625. Do the whole of the fishermen who are not connected with the Colne fish for sprats in the fishing season ?—Yes, every one of them.

59,626. Is there a large number of boats engaged in the sprat-fishing ?—There are 50 or 60 vessels generally, and sometimes 70 or 80.

BRIGHTLINGSEA.

J. Barber.

11 March 1865.

59,627. Are they the same vessels that go to the deep-sea oyster-fishing ?—Yes.

59,628. Are they the same people ?—Yes.

59,629. Do they get a good return from the sprat-fishing as a whole ?—They do the best they can.

59,630. Is it a valuable fishery to the fishermen ?—Do you mean the stow-boat season.

59,631. Yes.—It has been very good this winter, but in other winters it has not been so good.

59,632. Then I suppose this year would compare favourably with any season in your recollection ?—Yes.

59,633. There is no sign that the sprats have been fished out in any way ?—No.

59,634. Have you noticed when you have had a good sprat-fishing, that the coast is frequented by any other description of fish in the same year ?—No, I never saw such a thing.

59,635. Are there any flat-fish caught here ?—No, there are very few of any kind of fish caught here, except sprats.

59,636. Is there any line-fishing carried on here ?—No.

59,637. Or any sole-fishing ?—No, but it is the wrong time of the year for soles.

59,638. Is there no fishing on the flat grounds off here ?—There is, but it is not carried on by Brightlingsea vessels ; one or two small boats go out trawling for soles, I believe.

59,639. Did you ever know a steam-vessel to be used for catching oysters ?—Yes, I have seen it done.

The witness withdrew.

HENRY SIDNEY GOODY recalled and examined.

H. S. Goody.

59,640. (*Mr. Caird.*) You wish to add something to your evidence in reference to some Acts of Parliaments for private fisheries ?—Yes. Of late two or three fisheries have been appropriated by the Government to other purposes than a public fishery, and they have been brought under the consideration of the dredgermen of this neighbourhood. I allude to the fishery in the river Stour.

59,641. Is that near Harwich ?—Yes.

59,642. Above Harwich ?—Yes. The fishery there has been appropriated to other than public purposes, and we hear that that has been done with the sanction of the Government. Private individuals have been allowed to take up a portion of the fishing grounds for private purposes.

59,643. Was the ground which has been so taken up a public fishery ?—Yes ; and our friends here are very much disturbed about it.

59,644. Are you aware of that fact ? Do you know anything of the facts of the case ? Do you imagine that the ground to which you refer, and which has been so appropriated, was at any time used and productive as a public fishery ?—I have known it used and dredged as a public fishery, before this appropriation to a private company, and there is living testimony of that. The same thing has been done with regard to the Herne Bay fishery. In that case an Act of Parliament has already been passed, and the whole matter may be said to be over. There is now in this Session a Bill before Parliament for a similar object in connexion with the Roach River fishery. We understand that a company is about to be sanctioned there, which will take possession of grounds which have hitherto been public grounds, and that too, without putting up the grounds to any public competition. The object of the Bill now before Parliament is to enable certain persons to form themselves into a company in order to work the Roach River grounds, and persons round that neighbourhood and here are of opinion that such a course will do them great injury, and will deprive the public of a considerable portion of their rights.

59,645. When you speak of the Government, I suppose you refer to the Woods and Forests ?—Yes.

59,646. If the Woods and Forests had put these fishing grounds up to public auction, do you think there would have been no opposition ? Do you object that the grounds are being disposed of privately, or to their being disposed of at all ?—We object to their being disposed of at all, but we say, that if they are to be disposed of, then it ought not to be done without giving an opportunity to the public of competing.

59,647. Has your experience led you to form any opinion as to whether grounds of that nature can be fished with a better prospect of success and a large return by private enterprise, or by allowing the public indiscriminately to take possession of them ?—The only ground for opposing the conversion of these fisheries into private fisheries is that they are at present public grounds, which are now about to be passed over to private individuals, by which means the public will be deprived of the means of dredging upon those grounds ; and that also will be done without giving the public an opportunity of competing for the possession of the grounds.

59,648. Your objection is, that the public do not get an opportunity of competing ?—Yes.

59,649. You do not suppose that the establishment of these private companies will diminish the supply to the public ?—It will have a tendency to diminish the public use of the fishing grounds.

59,650. But not the supply of oysters to the public ?—Yes, I think it will.

59,651. Are not private individuals as likely to turn this ground to a good advantage in increasing the supply of fish as the indiscriminate use of it by the public ?—In establishing a company of this sort, with limited liability, they only run the risk of losing the amount of their deposit, and it is comparatively a matter of no consequence to them whether they stop or not. The case would be very different with a body of fishermen who have to get their living by the fishery, and who have to spend their whole lives at it. What the fishermen say now is, "You are doing

BRIGHTLINGSEA.

H. S. Goody.

11 March 1865.

"us a great injury by letting these mere speculators "come in, and deprive us of grounds we have worked "upon all our lives." It does appear to me that their complaint, on the face of it, carries considerable weight with it.

59,652. (*Mr. Lefevre.*) Have you known cases in which the Government have granted a lease of ground on which the public have dredged for oysters?—I understand that the Stour is a case of that sort.

59,653, The Government have no right, without an Act of Parliament, to grant grounds where oysters have been dredged for by the public?—So I say.

59,654. Therefore, where the public have been in the habit of dredging oysters, they will still have a right to do so?—Yes.

59,655. It is a different matter where an Act of Parliament has been passed?—Yes. In that case we can only call attention to the matter, and express a hope that the practice will not be continued.

59,656. Do your remarks apply to cases where Parliament has stepped in and converted grounds into private property?—Yes.

59,657. Do you say that they would be more productive if they were left open, than if they were converted into private property, with the view of making them a nursery for oysters?—I say that they are doing away with public rights.

59,658. Might not that argument be used against the Colne Company itself? By throwing the beds here open to the public, might not more good be done than by confining it to a particular class of men?—No, my experience is that you will not find any body of men better able to conduct the fishing than those men.

59,659. Is that not because they have the rights of private individuals over these particular grounds?—Suppose the Government were to take it into their heads to let off the Blackwater, it would do an immense injury to the fishermen.

59,660. Do you think that more profit is to be derived by the public generally from leaving the ground open, than by placing it in the hands of a private company?—I look at the matter in a wider sense than the mere catching of oysters. I have regard also to the maritime interests that are mixed up in the question. I think that considerable injury would be done to the public, if anything were done to deprive those men of the means which they have hitherto enjoyed of earning a livelihood.

59,661. You think it would interfere with the profits of the dredgermen living here?—Yes.

59,662. But would it not increase the supply of oysters to the public?—No, not at all.

59,663. Why do you think so?—I think that, while a body of men would be deprived of their means of subsistence, the public would not obtain a better supply of oysters, because I am satisfied that no other body of men could conduct the fishery better than it is at present conducted.

59,664. We are talking now of the open grounds, and not of the Colne Company?—Yes.

59,665. By incorporating a body of fishermen as the Colne fishermen are incorporated, for the purpose of obtaining oysters from the Blackwater, do you think a further supply could be obtained?—I do not think that the public could be served better than it is at present. The corporation of Maldon at one time sought to appropriate the ground in the Blackwater to themselves, and we fought the battle with them. I was never more satisfied of anything than I was that it was of the greatest public advantage that that ground should be open ground for the supply of spat and brood.

59,666. Is the ground in the Blackwater on which you find this brood larger than the Colne ground?—Yes, it is twice or three times, or four times, as large.

59,667. I understand from you that you never found on that ground anything but brood and spat. You do not find large oysters?—There may be a few found, but not many.

59,668. Then it does not supply oysters fit for sale?—No.

59,669. It only supplies brood for fattening?—Yes.

59,670. Might not some advantage be gained by converting it into ground to supply the market with fat oysters?—No. It is of advantage to obtain young oysters there, which can be matured.

59,671. Could they not mature there?—Not very well.

59,672. Then your argument goes to this, that it is of no use to cultivate the oyster?—No. I think there is disadvantage in cultivating the oysters.

59,673. But you think you have sufficient nurseries already?—What I say is, that there must be common ground, and there must also be ground for the cultivation of oysters. Both of them must exist for the purpose of properly conducting the oyster business.

59,674. Could not the same argument be used against the Colne Company?—But why say the Colne Company? Why not say every company? If it is to apply to the Colne Company, it would apply to every company.

59,675. Take the Blackwater river. The space of ground over which the brood is found there appears but a small proportion to the whole space of ground over the sea surrounding the coast from which you gather spat and brood?—It is the principal place to which they send for brood. The Blackwater is the largest place on the coast for supplying brood. Indeed it is the mainstay of the fishery, and if the Government did anything to cut off that ground, then the other oyster grounds would suffer.

59,676. Do you think there is a considerable extent of ground that might be enclosed and used for fattening oysters, without doing harm to the public?—I am not aware of it.

59,677. Looking at the whole of the estuaries of these different rivers, are there not considerable plots of ground which might be enclosed?—I think not. I may say that I have been consulted professionally with regard to the Stour. The fishermen say that that is a public fishery, and that it ought not to be taken from them. I have given notice that we shall try the question with them.

59,678. The Blackwater you consider to be necessary as a nursery, in order to feed the other beds?—Yes.

59,679. The third case you mentioned is that of the River Roach?—Yes.

59,680. Have there been any brood and small oysters found in the Roach?—Yes, I understand so.

59,681. That question will come before Parliament shortly?—Yes, but I am afraid the Bill has already passed the House of Lords, so that whatever has to be done must be done in the House of Commons. I have been directed to go before the Board of Trade on the matter.

59,682. (*Mr. Caird.*) Do you think that very much of your objection would be removed if the Woods and Forests were to give a public intimation before making an arrangement with a company as to letting off part of the land privately in this way?—I think there ought to be a notice given before any public right of any sort is interfered with.

59,683. I suppose they hold that they have a right to dispose of this property as common property. I presume that the Woods and Forests believe they have a right to dispose of it, and in that case would your objection be met by their disposing of it by public auction, so that every one might have an opportunity of bidding for it?—My objection is that it should be disposed of at all.

59,684. You desire that it should not be converted into private property?—Yes.

59,685. Have you heard that a plan has been projected for bringing the whole sewage of London down here upon the Dengie Flats and Maplin Sands?—I have not been acquainted with it.

59,686. If the Dengie Flats were to be enclosed

from the sea, do you think it would be prejudical?—I cannot say.

59,687. (*Mr. Lefevre.*) Can you give us any idea of the extent of the fisheries on this coast?—No.

59,688. Do you think that the legal position of the Colne Company and their want of power to borrowing money interfere with the profitable use which they might otherwise make of the grounds here?—I should like to reserve an answer to that question until we get rid of the lawsuit we have here.

59,689. By the application of capital to the ground of the Colne Company, might not a good deal more be made out of it than at present?—I cannot say that that would be the case. It would hang upon a good many things which we hope will be settled when the lawsuit is over.

59,690. (*Mr. Caird.*) Is it the general feeling among the fishermen here, who number 600 or 700, that it would be of advantage to them if the deep-sea fishery were open in the months of May and June?—Yes, and there is also another point, viz., that if the Government granted that, the two close months following should be closed more effectually; it never has been the case hitherto; in reality, the close time has been a sham.

59,691. You allude to the remaining two months?—Yes; there are men who have been in the habit of going out, although it was contrary to the law, and I think they ought to be stopped. Of course, when they have come home and have earned a pound or thirty shillings, they have induced others to go out also.

59,692. (*Mr. Lefevre.*) Is there not considerable difficulty in removing the oysters at that time?—We should want the fishing stopped altogether in the month of August.

59,693. You propose that July and August should be close months?—Yes.

59,694. Is there a considerable fishing in those months?—Yes, some will go, even if the fish are spoilt.

59,695. (*Mr. Caird.*) You also added, that it was an injury to you that the Woods and Forests should let off to a private company the grounds you at present consider public?—Yes; the fishermen here consider it part of their rights. It is ground which has been fished on by their forefathers from time immemorial.

59,696. (*Mr. Lefevre.*) Has the appropriation of the Herne Bay ground been a disadvantage to you?—It will be.

59,697. In what way?—We shall not be allowed to go there in future.

59,698. Were you in the habit of dredging there?—Yes. It might be that a little spat would be found there when it would be found nowhere else, and the fishermen will now be deprived of that. Of course if they are to lose the ground piece by piece, they must, in the end, sustain very considerable injury.

59,699. And, on the other hand, they will be subjected to competition with other companies in buying spat from elsewhere?—Yes, but we think they cannot keep the spat alive on the Herne Bay ground.

The witness withdrew.

Frederick Wiseman called and examined.

59,700. (*Mr. Caird.*) To what fishery or to what river does the evidence, which you are about to give, refer?—To the River Roach, which is a branch of the River Crouch.

59,701. Is that off Burnham?—Yes.

59,702. Does your evidence relate to the Burnham fishery?—No, but my beds are in a branch of the same river.

59,703. Is the evidence which you are about to give applicable to all the fisheries in the River Crouch?—Yes. In the first place I will read a few observations, which I have written down. I say, in the first instance, "that the failure of spat is caused by "the cold springs and summers so prevalent for the "last five years. Of this we are certain; our river "police get the temperature of the water three times "a day, and once during the night. On the 11th of "May 1864, the water at the bottom of the River "Roach, in two fathoms at low water, was 52 degrees; "after that we had eight days of very hot weather, and "on the 20th of May, the water was 69 degrees, or "one degree more than on June the 28th, 1863; it "then fell to 58 degrees, and remained so for some "time. We expect to see spat from the 7th of June "to the 21st. I find that the highest temperature, "on June the 11th, 1864, was only 65 degrees, and "the average, from June the 20th to July the 18th, "was 61. On the same day, on August the 6th, it "was tried by friends of mine at the Isle de Re and "also on the west coast of Ireland; at the former it "was 74 degrees and 72 at the latter. That accounts "for the French and Irish getting spat, and we "none."

59,704. Are you aware of the fact that the French and Irish have got spat in those years when you say there has been no spat here?—I believe they have.

59,705. Do you know it as a fact?—Yes, from friends who have been there. In fact, I have seen the oysters with the spat upon them.

59,706. Go on with your paper.—"At the same "time, it is a well known fact that the French "grounds have failed or have had scarcely any for the "last three or four years."

59,707. How do you reconcile that with the fact you have just mentioned?—They get more than we do. We had very little or none. They had a little, and it was more than we had, but still they have had a scarcity as well as ourselves. Nevertheless, they had a little. "The comparative failure there ac-"counts for their purchasing so extensively on our "coast. In fact, they have been buying them up "everywhere, and the people who have been in the "habit of purchasing oysters about here have had to "give more money for them in consequence. There "never would have been this outcry about the "scarcity of oysters, if there had been a succession "of spat there. I attribute the cause to the cold "weather we have had during the last five years. "As regards the French system, I have tried it upon "my grounds, and others have done the same, but it "has proved a decided failure. I found that fascines "or faggots were fine things to collect a bank of "mud, but not for the spat to adhere to." I did not get one spat, and I believe Mr. Buckland will bear me out in that.

59,708. Have you ever been to the Isle of Re?—No.

59,709. Are you aware that there is a muddy deposit in the Isle of Re, the same as in the Crouch?—I believe it is a sandy soil there.

59,710. Then the circumstances which render the use of faggots and fascines applicable in the Isle of Re, and useful there, are not applicable here?—No, but they are not considered useful there now. They have all been given up completely, and also the use of boxes. Kemmerer's tiles also collect mud. A few spat adhere to them. I found just as much spat on the surrounding culsh or old oyster shells as there were on the tiles. I have laid down a good many tiles, and sometimes I have seen one or two young oysters on a tile, but not often. At Southend, I believe they laid down 10,000 tiles, and they only got one spat on the whole of the 10,000.

59,711. They laid down 10,000 tiles at Southend?—Yes, and we have had more than that. I have found spat now and then round the tiles. I also tried to get spat in a pit or tank. I had the bottom covered with culsh, tiles, faggots, cockle and mussel shells, broken bottles, &c., and I also put in a bushel

BRIGHTLINGSEA.

F. Wiseman.

11 March 1865.

of oysters to throw out spat or spawn. All this proved a failure. I could not find one, although I searched for them. I believe that Mr. Buckland will bear me out in that statement.

59,712. You have told us of your failures—have you had any successes?—No, for the last five years the spat has always been a failure.

59,713. You have not discovered any mode by which you can artificially preserve the spat?—If we can once get it to adhere, we can preserve it, but the difficulty is to get it to adhere.

59,714. You have not discovered any mode by which you can succeed in doing that?—The grand object is to have the water sufficiently warm.

59,715. You require to have the temperature of the water high in order to bring the spat to a state of brood, and to enable you to preserve them?—Yes.

59,716. That is the real secret of success in oyster culture?—Yes, and we shall never get spat until we can have the water warmer.

59,717. Do you imagine that on the more southerly coast of France, where they have warmer summers, they may have successful spat seasons, when you, with a colder temperature, have unsuccessful spat seasons?—Yes.

59,718. It is not a question of fascines or anything of that description?—Not at all. I do not believe that at the Isle of Re they have the small culsh we have here.

59,719. Do you find that the small culsh you have forms a good bed on which the spat can be brought forward, if the temperature is sufficiently high?—Yes.

59,720. (*Mr. Lefevre.*) What kind of culsh?—Principally old shells. I buy from other places just the shells alone.

59,721. Have you extended your beds in that way by making ground for the oysters to spat on?—I have merely thrown shells over the beds to catch the spat. I buy cockle and mussel shells and such things.

59,722. (*Mr. Caird.*) Have you increased the extent of your ground by doing so?—I believe that it is a very good thing to have clean culsh.

59,723–5. What is the extent of your ground?—I have a piece a mile and a half long, but I have not had any spat upon it for five years, although I have laid out 20*l.*, 30*l.*, and 40*l.* every year in purchasing all sorts of things to lay down—cockle shells, oyster shells, &c. I have also had a good many extra men to clean the ground, and yet I have not been successful.

59,726. (*Mr. Lefevre.*) Is the whole of the ground in the Burnham river in the hands of private companies?—Part of it belongs to a company, and the other part belongs to private persons.

59,727. So that practically the whole of the river is in private hands?—Yes, except a little piece of common ground which they are seeking to take away.

59,728. With that exception the whole is private ground?—Yes.

59,729. Does this small portion of the River Crouch provide a considerable quantity of brood?—A tremendous lot; thousands of washes in a year.

59,730. Is there more in proportion there than here?—About the same, I think.

59,731. Have you any idea whether places well adapted for the fattening of oysters are not good breeding places for oysters?—I do not know much about that. Upon our ground they do not fatten first rate. Our oysters are green finned, and they do not fatten so well, although there is no difference in their breeding.

59,732. Do you think that fat oysters will breed as well as others?—Yes.

59,733. (*Mr. Caird.*) Will you go on with your paper?—"I beg to claim your attention to some im-"portant facts connected with the common ground "in the River Roach. I must premise, for your "general observation, that the common grounds are "the breeding grounds from which the supply is "mainly obtained for the cultivated beds. If the "supply of young oysters be taken away and given "to other people, how will it be possible to stock the "beds which are at present cultivated? For the "last five years the stock of young oysters or spat "has been very deficient, and if the small supply be "again subdivided and given to a fresh lot of pro-"prietors, it will not pay any of us to carry on our "business, and the matter must end in the ruin of "everybody." You will see from the map that the piece of common ground is surrounded by private beds on all sides, so that the stock from the private grounds falls on to the commons. In fact, the oysters got there all belong to us.

59,734. How did that ground ever happen to become common?—I cannot inform you.

59,735. Does nobody claim any right of property upon it?—No, only over the little pieces taken out of it as it were. "It is quite evident that, in such a "river as the Roach, the young oysters found on the "commons must be the offspring of those on the "private beds, and it is a very hard case that our "young oysters, when they pass an imaginary line, at "once become the property of another person. We "do not want the ground for ourselves, but simply to "remain for the poor dredgermen to earn their liveli-"hood, as they have been in the habit of doing from "time immemorial, and to give us the opportunity of "purchasing our own property."

59,736. Is that all?—Yes.

59,737. Cannot you give us something about the practical management of the oysters?—I thought you wanted to know something about the scarcity of oysters.

59,738. So we do.—Then I say, that by taking these grounds in, the supply will not be any greater than it is at the present time.

59,739. Is there anything else you desire to mention to us upon this subject?—Experience has shown me that the spat and the young oysters on the common ground come up in the dredge. Those young oysters must come from somewhere, and the only place from which they can come is the cultivated beds. I have dredged on the commons, and I have found upon every shell taken up 5, 6, 8, or 10, and sometimes 20 and 40 spat on a shell. The contents of every haul we made was worth 1*l.*, and it would be so again if we had a spat.

59,740. (*Mr. Lefevre.*) There would be no loss to the public in consequence of this common ground being converted into private property? There would simply be a transfer of ownership?—Just so, but what are the dredgermen to do? What is to become of them?

59,741. I presume that the owners of the private fisheries employ a considerable number of men?—Of course they do. I used to employ a dozen, but now I have only six, because we have no oysters to catch.

59,742. How have you supplied your beds during the last three or four years, since the failure of the spat?—I have scarcely had any oysters. I have had very few indeed. If the spat had not adhered in 1858, we should have had none left.

59,743. Have you tried the plan of purchasing oysters from a distance, from Falmouth and Ireland?—No. They purchase here, but we do not, although there are persons at Burnham who purchase Channel oysters and lay them down. I do not, however.

59,744. (*Mr. Caird.*) You have nothing but oyster-fishing in the Crouch river?—There is trawling and shrimping. They catch dabs, plaice, and flounders.

59,745. Is that extensively practised?—No.

59,746. There is no important fishery of that kind there?—No; there are one or two fishermen in the river, but I believe that the dredgermen have trawls, and that they fish with the trawl when there is anything to be caught.

59,747. Is there any other point you desire to bring before us?—Well, I know a case in which a bed of

oysters was found in the Channel. It was at the end of the season, and they were very small, so the persons who found them thought they would not go for the purpose of catching them until the commencement of the following season; but when they went they found that they were all dead, having been killed by the five-fingers.

59,748. Where was that?—In the Channel. It was a bed of small oysters.

59,749. Could any means have been adopted by which those oysters could have been protected?—Yes, if the people had been allowed to work there.

59,750. Have you yourself fished oysters in the deep sea?—No.

59,751. Then you do not speak from any practical knowledge?—No; I have never dredged, only in the rivers.

59,752. (*Mr. Lefevre.*) Is there a considerable population at Burnham dependent upon the oyster-fishing?—I cannot say exactly.

59,753. Are there a considerable number of men employed by the different owners of beds in dredging?—There are a great many, but I cannot say how many. There are not as many, however, as there used to be.

59,754. Is the Burnham Company a corporation like the Colne Company?—No.

59,755. Is it private property?—Yes. They hire it of Sir Henry Mildmay.

59,756. Are they dredging all the year round to clean the beds?—Yes.

59,757. Do they consider that necessary?—Yes.

59,758. Do they think that, if they left off during a portion of the year, mud would accumulate?—It would make a great difference. In the first place, that river is always infested with five-fingers, and, unless it were continually worked, the five-fingers would kill the oysters. The same applies to our own river.

59,759. Do they attack the brood?—Yes, and the large oysters too. They attack both young and old.

59,760. Is that not the case also in the Roach river?—Yes, just the same. In working my ground, I generally leave off for one month in the year, having other things to do. I leave off working as soon as the spat begins to fall. I tell my man that as soon as he sees spat he is to leave off.

59,761. You leave off for a month?—Yes.

59,762. Is that generally done?—No. In one year in particular, I left off for a month, and when I went again I found the ground covered over with a sort of slimy weed. I did not get a spat that year, but there were several gentlemen in the immediate neighbourhood who worked all the year round, and they had a large spat.

59,763. Do you think that the interval during which you ceased dredging was detrimental to the ground?—Yes, I do, because weeds and mud collect so fast.

59,764. (*Mr. Caird.*) In what month was that?—In the middle of June. Sometimes it is July before we see spat.

59,765. (*Mr. Lefevre.*) Then it is of great advantage for the ground in the Roach river to be dredged all the year through?—Yes, there always is a great advantage in constant dredging.

59,766–7. (*Mr. Caird.*) The oysters in the River Roach have some peculiarity, have they not?—Yes, they are green, and, for that reason, are not saleable in the London market, but they find a very ready market in Ostend, which has been supplied with oysters from the River Roach for the last 70 years

59,768. Is the supply increasing or diminishing, or has it kept stationary?—There is a greater demand for them, but the supply is very bad.

59,769. What is the cause of the greenness?—I cannot account for it, unless it arises from a certain green weed that grows there.

59,770. Is there any mineral there which may occasion it?—No.

59,771. And in the River Crouch, close by, are the oysters always white?—Yes.

59,772. The oysters from the Roach find a ready sale in Ostend?—Yes.

59,773. Are the Burnham oysters white oysters?—Yes.

59,774. And the Roach river opposite produces a green oyster?—Yes, on account of the green weed that grows there.

59,775. Is that where the common ground is?—Yes.

The witness withdrew.

William Minter called and examined.

59,776. (*Mr. Lefevre.*) Are you a dredgerman?—Yes.

59,777. And a member of the Colne Company?—Yes.

59,778. How long have you been at work yourself?—As a dredgerman?

59,779. Yes.—Seventeen years.

59,780. Before that, you were an apprentice, I suppose?—During part of the time I was.

59,781. All the members of the Company are obliged to serve an apprenticeship?—Yes.

59,782. Have you got a smack of your own?—Yes.

59,783. Have you found that, during the last year or two, you have not made so much money, or has the increased price of oysters made up for the decreased quantity?—There has been an increase in the price of oysters, but it has barely made up for the decreased quantity.

59,784. Does dredging for the Company take up most of your time?—Not altogether.

59,785. During the open season, how long are you dredging for the Company? Do you dredge for them every day?—No, it depends on the weather.

59,786. Do you do anything else in the open season, except dredging for the Company?—Yes.

59,787. What else do you do?—I go out fishing.

59,788. Does dredging for the Company take up half of your time?—No, not always; sometimes it does.

59,789. During the close season, you do not do anything for the Company?—No, not for the Company.

59,790. Do the Company pay you wages, or so much for the oysters you dredge up?—Yes.

59,791. How is the price regulated?—The jury set the price at so much per wash.

59,792. How many wash are you able to take up during the season in a week?—I do not know; I have not kept an account of that.

59,793. What price do they pay you per wash?—I do not know the average price; it varies.

59,794. During this last month, what have they been paying you?—About 16*s.* for a wash. That will take three or four days to get. I think we well earn it.

59,795. Six years ago, what did you get for a wash, before the failure of the spat?—Oysters were cheaper then, and we did not expect to get more than 7*s.* or 8*s.* They were not above half the money they are now.

59,796. On the whole, do you make a pretty good thing out of the Company?—No, I do not think we do.

59,797. (*Mr. Caird.*) Are you any better off than the fishermen who are not connected with the Company?—There is very little difference.

59,798. Is it of any advantage to you, as a fisherman, to be a member of the Company?—Perhaps I might be able to earn a little more, if I were free to

BRIGHTLINGSEA.

W. Minter.

11 March 1865.

go anywhere else; but I have a little to look to besides, and I cannot speak of other people who have nothing but the fishing to depend upon.

59,799. Is there any suggestion you can offer to us for the improvement of the oyster fishery here, as the result of your experience?—I think that, if the fishermen were allowed to work a little longer in the spring time, and to leave off in July and August, it would be of advantage to them.

59,800. To work on the common ground?—Yes.

59,801. At present, I understand that you have very few oysters on the common ground?—We have very few oysters anywhere, but I am speaking of the Channel.

59,802. I thought you said the common ground here?—It is common ground in the Channel.

59,803. Then you did not refer to the company's ground?—We do not call that common ground.

59,804. (*Mr. Lefevre.*) Did you hear the evidence which has been given by the other witnesses?—Yes.

59,805. Do you agree with it?—Yes.

59,806. As to the extension of time?—Yes.

The witness withdrew.

J. Welhun.

JOHN WELHUN called and examined.

59,807. (*Mr. Caird.*) Are you engaged in the shrimp fishery?—I have not been engaged in it for seven years.

59,808. Then you cannot give us any information as to the present state of the shrimp fishery?—No, not for the last seven years.

59,809. Are the fishermen here allowed to fish on the Company's ground for shrimps?—No.

59,810. Does the Company have a right to fisheries of all kinds on their own grounds?—The right of fishing altogether is vested in the Company.

59,811. Do they not allow any other fishing except oyster dredging there?—No.

59,812. Is that the same with regard to the Burnham river?—I am a stranger there; I cannot say.

59,813. Is this a great shrimping place?—No, but there are a great many boats from Wivenhoe and Harwich.

59,814. Are they increasing in number?—Yes.

59,815. Is the shrimp-fishing increasing in productiveness?—Yes.

59,816. Then it has not been found that it has been fished out in any way?—No.

59,817. It has not been over fished?—No.

59,818. Is the shrimp net a trawl net?—Yes.

59,819. With a very small mesh?—Yes, quite a small mesh.

59,820. Do you catch any other kind of fish except shrimps?—Yes; all kinds of fish that lie on the ground.

59,821. And do you catch the brood of fish of various kinds?—Yes, of soles, skate, and so on.

59,822. Do you do much injury to the brood of other fish by dredging?—No, I think not.

59,823. Are the small fish you catch destroyed?—No; the small fish the fishermen throw overboard, and they live, and the large ones they take out and keep.

59,824. Are not many thrown overboard dead?—Not out of the shrimp nets. I have seen small soles caught, but they are always thrown overboard alive.

59,825. Is it not the fact that the shrimps have become scarce of late years?—I think not, on this coast.

59,826. What is the ground over which these men shrimp?—In the river, off Maldon.

59,827. On the ground between Gunfleet and the coast?—Yes.

59,828. From Harwich right down to the Blackwater?—Yes.

59,829. What number of shrimpers are there?—There are about 100 boats employed.

59,830. With two men in each?—Yes.

59,831. Have they altered their mode of fishing in the course of years?—No.

59,832. Have they adopted no improved modes of fishing, such as a larger net or boats?—No; it is all in the same style.

59,833. Is the fishery of shrimps increasing?—Yes.

59,834. Is it more remunerative to the fishermen?—Yes.

59,835. (*Mr. Lefevre.*) Is there any attempt made to separate the small fish from the shrimps?—They separate them as they catch them.

59,836. On the deck?—As the shrimps are turned out, they throw the small fish overboard with the rubbish, and the others are kept.

59,837. Are those that are thrown overboard thrown overboard alive?—The small shrimps that are thrown overboard are dead.

59,838. But I mean the small fish?—They are all alive.

59,839. Then no damage is done to fish at all?—No. There are only a few soles, which are very small, which are taken up. There are not many fish there at all.

The witness withdrew, and the inquiry was adjourned until the 16th March, at London.

London, Thursday, 16th March 1865.

PRESENT:

J. CAIRD, Esq., M.P. (Chairman). | Professor HUXLEY, F.R.S.
G. SHAW LEFEVRE, Esq., M.P.

LONDON.

Mr. F. Buckland, M.A., M.R.C.S.

16 March 1865.

Mr. FRANK BUCKLAND, M.A., M.R.C.S., late 2d Life Guards, called and examined.

59,840. (*Professor Huxley.*) You have interested yourself a good deal in fisheries, Mr. Buckland?—Yes, for the last three years I have hardly done anything else.

59,841. To what modes of fishing have you paid particular attention?—To the cultivation of salmon and oysters.

59,842. The cultivation of salmon does not fall within the province of our inquiry, but we shall be glad to have any information you can give us in reference to the cultivation of oysters. Have you visited France for the purpose of ascertaining the mode of cultivating oysters which is practised there?—I have. First of all I visited the east coast of England and examined the oyster fisheries in the mouth of the Thames, in order to make myself acquainted with our own mode of cultivation. Having done that, I went to the west coast of Ireland, and learned what was going on there, and then I went to France, to the Isle of Re, and stayed there until I imagined that I had exhausted the whole of the subject.

59,843-8. I believe there is a great difference between the English and the French mode of culture?—There is.

59,849. In the first place I will ask you if there

is any part of the English or Irish coasts where any method of breeding oysters is practised?—There is no part of the English or Irish coasts where the artificial mode of breeding oysters is resorted to at present, that I know of, on a large scale.

59,850. But upon the French coast there is?—Yes.

59,851. Have you made an investigation into that process as it is now practised in the Isle of Re?—Yes, I have.

59,852. I believe that that practice was set on foot upon a large scale in France some years ago, mainly through the agency of M. Coste?—Yes, but it was first discovered by M. Hyacinth Bœuf, a stone-mason, whom I visited at Rivedoux, a village in the Isle of Re, opposite La Rochelle, and with whom I had some four hours' conversation.

59,853-4. Will you shortly describe to us what the method adopted by M. Bœuf is?—Perhaps, in the first instance, I had better describe where the oyster beds are situated.

59,855. Are the principal breeding grounds on the in-shore side of the Isle of Re?—Yes.

59,856. On that side there is a long foreshore combined with very shallow water, and protected from the violence of the waves of the Atlantic to which the other side of the island is exposed?—Yes.

59,857. Will you now describe the method practised upon that particular ground? In the first place, how do they clear the ground?—The ground is not cleared at all except by nature. This (*producing a bottle*) contains a specimen of the best breeding ground on the Isle of Re, and it is what is called *sable vaseuse*, a kind of muddy sand with pebbles.

59,858. Is there much growth of corallines upon the surface of the ground?—No, there is none at all, that I saw.

59,859. And there are not many shells mixed up with it seemingly?—No.

59,860. It appears rather to be a kind of fine gravel?—It is rather a fineish gravel. This is a photograph of one of the best breeding places in the island, called "La Moulinade." It is one of a series of photographs taken at the instance and expense of my friend, Mr. Thomas Ashworth, who accompanied me to the Isle of Re.

59,861. Is the rise and fall of the tide very great there?—I cannot answer that question, but I believe it is from 10 to 15 feet.

59,862. Is this foreshore the main place for the cultivation of oysters?—Yes.

59,863-4. Is it between tide marks?—Yes, from there to there (*pointing to the photograph*) is where the tiles are laid down.

59,865. Is the ground not cleared at all?—A man just goes over it with a broom before he lays down the tiles; that is all.

59,866. Will you describe the process of laying down oysters for breeding?—They lay down comparatively few oysters for breeding purposes on the most successful breeding place in 1864, viz., Chanchardon, on the south side of the island. That is a most extraordinary thing, and I will explain why that is afterwards. They simply divide the foreshore into square portions or parks. Those parks vary in size, but the best proportions are those which have been adopted by Madame Sijourde, a peasant's wife, who makes a good deal of money out of her oysters.

59,867. What is the size of the ground that she occupies?—About 1,600 "*metres carrés*,"—a metre is about three inches more than a yard,—is about the size of her oyster parks, and it is considered that each park ought to produce from 17,000 to 20,000 oysters.

59,868. How does she mark out her particular area?—They take stones, piling them above each other, and making an embankment about a foot high.

59,869. Is it a kind of fence or boundary line?—Yes, it is both. It becomes both a fence and a boundary line.

59,870. How high will it be?—About a foot. It ought not to be higher, and that is a very important matter.

59,871. Is it made of large stones?—It is formed of the rubbish lying about, and occasionally stones, the size of dinner plates, brought from the shore.

59,872. Do they bank the interstices?—Just sufficiently to enable the park to hold water.

59,873. Then is it a kind of rough stone wall?—Yes, made water-tight.

59,874. Is it made square?—It is made of any shape, but generally square.

59,875. The first step is to enclose this area?—Yes.

59,876. What is done next?—The next thing is, after sweeping it clean, to put down things for the purpose of catching the young oysters. They put down such things as that broken piece of pottery, on which you will see there is a large number of young spat.

59,877. Is there any advantage in using any particular materials for that purpose;—formerly, for example, they used fascines and faggots?—These have been found to be of no use at all. When these failed, my friend, Dr. Kemmerer, the chief physician of St. Martin (the capital of the Isle of Re), invented a tile of which I will show you a specimen presently. In the first place, they put down broken pieces of pottery. Secondly, they lay down broken pieces of glazed crockery, such as this, upon which you will also observe a very large number of young oysters, and very fine specimens they are. You will see them almost of all sizes. They also lay down broken plates.

59,878. Do they dispose these things in any particular order?—No, they are all strewed over the park.

59,879. Will you tell us how much time it will take, or how many days' employment it will afford to a man to cover this area of 1,600 square metres properly?—It occupies hardly any time at all. All the work is done by people of the very poorest description, who work at it in their leisure time, and when the tide serves.

59,880. Then the process is a very cheap one?—Exactly so.

59,881. Can you give us any idea of the cost of preparing an area of 1,600 yards?—No, I cannot, but I can tell you how many parks there are in the Isle of Re. There are 2,000 parks already made, and there are licences granted for 4,340.

59,882. You do not happen to know what the cost is of preparing the ground for the oysters?—I cannot say, but the cost must be very trifling; it is done principally by women and children, and the wages of a labouring man in the island is from one franc to a franc and three-quarters per diem.

59,883. Then the prime cost of preparing the ground is very insignificant?—Yes, very.

59,884. What time of the year is that done?—Just before the oysters begin to spat.

59,885. And what do they reckon to be that time in France?—From June to September; but they do not give it up, and I beg you to mark that, until nearly the end of October. They do not give up the idea of spatting until then.

59,886. Having prepared the ground, and covered it with these broken pieces of pottery and other materials, how long do they leave it before they examine it to see the result?—They leave it alone with the exception of going upon it occasionally to see how matters are going on.

59,887. Is the space enclosed covered by every tide?—Yes.

59,888. Is it ever left completely uncovered by the tide?—Never. That is the great secret. There are always about six inches of water over the ground in each park.

59,889. Do they select for the oyster parks ground which is naturally covered at spring tides, or do they deepen the parks artificially?—The best parks

LONDON.

Mr. F. Buckland, M.A., M.R.C.S.

16 March 1865.

are those which are least uncovered by water at any time.

59,890. Do they ever take a place for a park which is uncovered at lowest spring tides?—Yes, the best parks are situated as far out to sea as possible.

59,891. If they are obliged to go out as far as that, are they not liable to have their walls or enclosures washed away by the least gale of wind?—That would be the case if they were too high. I saw upwards of 3,000 tiles smashed all to pieces by one storm at La Moulinade. These tiles, contrary to Dr. Kemmerer's advice, had been built too high by somebody who knew better than the doctor. He called them "the Tower of Babel." The walls should never be more than a foot high.

59,892. Even at that height, would not a very small play of water wash the walls down?—They say not.

59,893. Practically they do not find that to be the case?—No.

59,894. In that depth of water will not a very slight breeze be sufficient to disperse the tiles altogether?—It does happen sometimes, but there is a great art in laying down the tiles—Dr. Kemmerer's tiles. They are always heavily weighted with stones.

59,895. Do they dispose the pottery in any way?—No, they are thrown all over the parks. Here is a piece of faggot, but faggots have been found worse than useless.

59,896. Do they not float?—They collect the mud, and what few little oysters are caught upon them very often die. If they do not die, the sea worms come in and eat the wood, and then away go all the oysters.

59,897. When they lay down faggots do they stick them in the ground?—They have discontinued the use of faggots for the last three years.

59,898. Did they, when they used them, stick them in the ground or lay a weight upon them to keep them down?—I do not know; their use has been long discontinued.

59,899. You say there is no particular method of disposing of the fragments of pottery?—No, they throw them all about, but the tiles are placed in regular order.

59,900. Is there any particular art in disposing of the tiles?—They are made like the segment of a drain tile. They are common house tiles, as used in France, and are not made for the purpose of oyster catching. This, for instance, is a common French house tile,—the common tile used in France for covering the roofs of houses.

59,901. How do they lay them down?—Suppose the sea is coming in here, they are laid in this way (*describing*). They must not be laid across the sea.

59,902. They are laid to the sea?—Yes.

59,903. Are they laid with the concave or convex side up?—The concave side is down always, and the reason of that, if you wish to have the reason, is, that the young oysters invariably, as the French say, *cherche l'abri;* they always go underneath everything. This tile has been turned so. You would never find an oyster upon the top of a tile when he can get underneath.

59,904. When they use house tiles, do they put them down in one tier only?—There must be only four of them. If you have a fifth, you will certainly come to grief, because the waves will knock them all over.

59,905. They are put crossways?—Yes.

59,906. So that the tiles in the successive layers are at right angles?—Yes, and they are weighted heavily with stones.

59,907. On the top?—Between the interstices and on the top.

59,908. Is that plan better than the system of laying down loose pottery ware?—The best order for apparatus to catch spat is this—first, tiles, secondly, broken pots, and thirdly, glazed earthenware.

59,909. The difference in cost must be very great indeed between putting down fragments of earthenware and these tiles?—Yes, there is a considerable difference in the cost.

59,910. Is that difference made up by the difference in the catch of spat?—I did not enter into the money part of the question when I was over there. I was very careful not to enter into that. I should certainly say, that the plan of laying down tiles is the most expensive they adopt, but it is much easier to get the oysters off from the cemented tiles than from the common pottery. About one-third of the young oysters are destroyed when knocked off the pottery, whereas they can be detached from the cemented tiles with hardly any loss.

59,911–12. Is this method of employing tiles largely practised?—Yes, among the richer people, especially at La Moulinade.

59,913. Then it is clear that tiles must be most advantageous, because they must cost a great deal more?—Yes, these tiles, delivered in England, cost about three halfpence each, and Dr. Kemmerer will supply them at that price.

59,914. Whereas the pottery is next to valueless?—Yes, comparatively speaking.

59,915. These tiles seem to have a kind of cement upon them?—That is the section of a tile, which I have broken on purpose to show the manner in which it is prepared. There is the tile itself. Then, next to the tile, comes a piece of paper, and then the cement, which is made of hydraulic lime and other materials for which a patent has been taken out by Dr. Kemmerer. The young oysters adhere to that. This piece of tile has no cement upon it, and by comparing it with the other you will see what I mean. The oysters always go underneath the tiles. They go and stick there underneath.

59,916. With their convex valves upwards?—Yes. The oysters, as I have explained, adhere there, and when they become of the right size a man goes with a knife and picks them off, separating the cement from the tile.

59,917. And being stuck upon that soft cement, he is able to remove the oysters without breaking their shells?—Yes.

59,918. (*Mr. Lefevre.*) Do they cover the tiles with cement before they lay them down again?—Yes, in the month of May, and they lay them down again in June.

59,919. (*Professor Huxley.*) That must increase the cost?—I think not much. The operation is very inexpensive.

59,920. Is the cost of labour inconsiderable?—Labour over there is not very dear.

59,921. Then we must conclude that there is considerable advantage derived from the adoption of that method?—Yes, in the Isle of Re, but I do not go further than that. There are doubtless many places in England and Ireland well adapted for tiles.

59,922. By the method you have described to us, the spat is collected to a very considerable amount on the tiles?—Yes.

59,923. Where is it supposed that the spat comes from? Are there large natural beds out at sea?—The spat comes from there, as well as from the oysters laid down to breed.

59,924. (*Mr. Lefevre.*) Are these (*pointing to the map*) natural oyster beds?—At the Bay of Chanchardon, facing the Atlantic, I was told by M. Simon Neauvau, Garde des Parks, that there was a large oyster bed out at sea, and the spat from that was washed on to the parks in the bay.

59,925. On the east side of the island are there any?—None are laid down.

59,926–9. But there is a great oyster bed out there, on the south side?—Yes, opposite Chanchardon.

59,930. (*Professor Huxley.*) You say there is a large natural bed somewhere about this region, (*pointing to the map*)?—Yes. The depth of water runs from 27 to 45 French feet.

59,931. Have you any reason to believe that there

are natural oyster beds in the inner Channel?—I believe there are, but I do not know.

59,932. In the channel called Pertuis Breton?—I believe so, but all the oysters on that side of the island have failed this year from ascertained causes.

59,933. In any case do the owners of the oyster parks trust to the natural drift of the spawn to cover the tiles?—As far as I could make out, a great deal of the spat comes from the open sea, and some from the oysters placed among the tiles to breed.

59,934. (*Mr. Lefevre.*) Do they not lay down oysters on the beds with the view of providing spat?—There are oysters left there, but the moment they are of a certain size off they go, to the *claires*, to be fatted.

59,935. They do not leave them to breed?—Some are left on the beds, and those, of course, breed. If I were making new parks, I would put down oysters to breed, and not trust to those drifted in from the sea; the best oysters to breed are those from two to four years old.

59,936. (*Professor Huxley.*) Are the natural beds worked at all?—By dredging?

59,937. Yes.—There is not such a thing as a dredge on the island, that I could hear of.

59,938. There are no dredges in the Isle of Re?—No.

59,939. So that they trust altogether to the natural collection of spat in the way you have mentioned?—Yes, the spat is brought in by the tide, and comes also from the oysters in the locality.

59,940. Is that the case all round the Isle of Re?—I do not know, but I think so.

59,941. Do you know if there are any artificial beds upon which young oysters brought from a distance are laid down?—They bring oysters from England, and lay them down to fat. I saw a large quantity of Falmouth oysters fatting in the *claires* at Loix.

59,942. Then is there no source for the supply of spat to these plantations, except that afforded by the natural oyster beds?—I think you may take that to be the fact, in many cases.

59,943. What do they do next after they have collected the spat? What length of time do they allow to elapse, before they examine the plantations for the purpose of collecting the young oysters?—Until they think the spat has fixed.

59,944. In what month is that?—Five or six months after the spawning season. They turn the tiles over then.

59,945. What size will the young spat be then?—There they are on that piece of glazed pottery. That one is about a month old; that is about a fortnight, and that is not a week old.

59,946. The largest will be from half to three-quarters of an inch in diameter?—Yes.

59,947. Would you consider than an oyster about three-quarters of an inch in diameter, would be half a year old?—I think so, at least in the Isle of Re.

59,948. Is this size,—namely, about three-quarters of an inch,—about the size they will get them at the end of September?—Those are early ones, I suspect that they were spatted in June. Here are some that have probably not been spatted more than a week.

59,949. At what size are they considered fit to be removed?—When they are about a year old, from three to four centimetres in size.

59,950-2. Do they not begin to remove the young oysters during the first year at all?—No, they leave them alone.

59,953. Do they do nothing at all with the bed during the first year?—They merely use it for collecting the young oysters, and when the oysters are grown they take them away. As the crop comes to perfection they remove it to the *claires*.

59,954. About the end of September they begin to look to their plantations?—Yes.

59,955. Then what do they do? Do they remove the oysters from the tiles?—They do nothing at the end of September. They wait until the oysters come to the proper size, whenever that may be, and they keep on picking them out. They take them off the tiles, where tiles are used, but where they are on crockery ware they smash the pieces up. They then put them upon a donkey in panniers, and take them to the *claires*.

59,956. Are the *claires* like the parks we have on different parts of the coast of England?—They are not quite the same.

59,957. The *claires* are a kind of pond, are they not?—I will describe how they are made. You will see upon the map here a small neck of land.

59,958. Where is that?—In the Isle of Re. That is the breeding place, and there is a sort of muddy lagoon, which they call the Fosse de Loix.

59,959, Is that lagoon enclosed?—No, it is open to the sea.

59,960. Does it become bare at low water?—Yes, but the *claires* are never empty.

59,961. Do they square it out?—Yes, and make ponds about three or four feet deep.

59,962. Do they deepen it artificially?—Yes, they pile up the mud on one side, so as to make a pond with water always in it.

59,963. What will be the superficial area of those ponds?—They are generally from 25 to 30 yards square, but they may be of any size.

59,964. By digging out the mud, they make a wall and a pond?—Yes.

59,965. Do they make the excavation sufficiently deep that the space within the pond is never absolutely bare?—Under no circumstances is it ever bare.

59,966. In those ponds they lay down the oysters?—Yes, the lean young oysters.

59,967. Do they put them down in any particular way?—No, they throw them down anyhow. One man may like to have them one way down, and another another. It would be too much trouble, as a general rule, to put them down in any particular way.

59,968-9. Do they put them down in one tier, or in a number of tiers?—They take care that there shall never be more than 100 oysters in a square metre.

59,970. Are they laid down in one layer or more?—They are never placed one over the other, and those oysters which at one year old are so placed on this ground, at three years old have attained this size (*showing an oyster*). They move some oysters when they are one year old, and some when they are two years old.

59,971. At one year old they are about an inch and a half across?—Yes, but the size varies in various places.

59,972. And at three years old they are about three inches in diameter, and from that to four inches?—Yes. They will have increased at the rate of about 30 per cent. a year in the *claires*.

59,973. They are laid down and left in those ponds?—Yes.

59,974. What happens then?—They are raked three or four times a year. A man goes over them with a rake, so as to prevent them from sinking into the mud.

59,975. Does any growth of corallines or the like take place?—No.

59,976. Is there any importation of annelides?—No.

59,977. Or of the *spirorbis*?—No.

59,978. The shell of this one is perfectly clean?—Yes.

59,979. Is there any fresh water at all upon this lagoon—the Fosse de Loix?—That again is very important. The oysters fatten best in wet weather, and that is because they get fresh water from the rain-fall.

59,980. There is no natural stream of fresh water?—That is the fault of the *claires*. There is no fresh water over them. This is a Falmouth oyster, which was brought by a Frenchman, and laid down on one of the *claires*, and see how fat it has got. There is a curious thing that seems to happen to the English oysters, which was pointed out to me by M. Coste himself. When they are thrown down upon the

claires on the French coast, they begin to throw off their English shell. You will see that in the oyster I produce. There is the Falmouth shell, and that is the French growth.

59,981. But in the process of natural growth, the oyster would always be adding a new shell as he got older?—True, but there is an alteration in the composition of the shell itself.

59,982. You think there is a broad line of demarcation?—Yes. After the oysters have been laid down on the *claires*, the shell begins to exfoliate, and as we medical men say, "slough off." You will see what I mean upon this, which is another specimen, but it is not quite so well marked.

59,983. Is that generally the case?—I am told that it is the case with more than a third of them. I could not get hold of any of the oysters; they would not give them to me. They are very careful of them. They leave the oysters on the *claires* until they are fit for the market.

59,984. Can you give us any idea of the cost of making a *claire*?—No.

59,985. How many times in the course of a year do they rake the oysters?—There is generally a man employed for that purpose—an old soldier, or person in that class of life—who goes to the bed and rakes it, whenever he sees the oysters getting too much covered.

59,986. How many times is that done in the course of a year?—Whenever he sees the oysters getting down into the mud. The oyster can feed with his mouth out of the ground, and can squirt away, but if he is getting too low, then the ground is raked over, and the oyster raised out of the mud.

59,987. You say that they are all scattered down anyhow?—Yes.

59,988. Are they found after a time to be lying in the ponds in any particular attitude, with one valve or the other valve down?—My answer to that question is, that an oyster will not move himself if you place him in a particular position; but the natural position of the oyster is twofold; when he is a young oyster, he invariably, without exception, fixes himself upon the point of his heel.

59,989. What do you call the heel of the oyster?—This (*pointing to a shell*) is what I mean.

59,990. Close to the umbo of the convex valve?—Yes.

59,991. So that if the thing he fixes himself to happens to be horizontal, he is inclined at an angle of 45 degrees?—Yes. I have taken a great deal of trouble in that matter, and I make out that, as the oyster grows, he tilts up so (*describing*).

59,992. He begins by fixing himself on the convex valve?—Yes, on the edge, and on the umbo. I think this is very important, and it really affords us one of the most beautiful studies in nature. This specimen is from M. Bœuf's park, and you will there see a group of oysters fixed as I have described. The reason that nature has made that provision or law is, that when the oysters get to a certain size, they press each other off, and get loose. That is the natural mode of "culling" oysters.

59,993–4. (*Mr. Lefevre.*) When they are very thick, I suppose?—When they are getting very thick, they separate themselves right off.

59,995. (*Professor Huxley.*) Is that not because the increasing weight of the oysters tears them from the original base of attachment?—They are fixed by a minute point, and the weight of the shell goes on increasing. As the shell grows, the oyster may possibly tumble off.

59,996. I take it that the oyster is fixed by a certain amount of base, and as long as he is very small, that is enough to hold him?—Yes.

59,997. And when he gets bigger, the weight becomes too much, and he tumbles off?—Yes. The natural position of the oyster when young, therefore, is as I have described; but when he becomes a wild oyster, in the sea, the natural position is that (*describing*).

59,998. With the flat valve down?—Yes, the flat valve down.

59,999. How does the oyster get in that position?—The waves turn him over.

60,000. The position with the flat valve down is a more stable position?—Yes. The reason why I come to that conclusion is this. If you will take a stone from the bottom of a river you will find that the clean side of the stone, is that which is down, and that the dirty side is that which is up. A friend of mine, Mr. Thomas, who owns vessels that go to the North Sea, brought me some oysters from the North Sea, every one of which were covered with weed, &c., on the convex side.

60,001. That is always the case. You always get the corallines on the dorsal surface?—On the scallops it is the other way. I think it is a beautiful provision of nature to prevent the pressure above from proving injurious.

60,002. The oysters, after they have resided on the *claires* for three years, are ready for the market?—Yes.

60,003. Or is it when they attain the age of three years? Suppose they were spatted in May 1860, when would they be ready for the market?—They would be ready in 1864, but they would be better in 1865. Mr. Wiseman tells me that he sends his oysters to the market when they are between four and six years old, but it all depends on the growth of the oysters. Some oysters will be fit for the market in three years, whereas some will not be fit for the market till four or six years old. An oyster of that size (*producing one*) is not marketable; but an oyster that size (*producing another*) is. Therefore you must send to the market as soon as you can. This is an oyster from the Isle of Re that will bear out my argument exactly. It is an oyster which I should calculate to be about 15 or 20 years old.

60,004. (*Mr. Lefevre.*) Can you tell the age of an oyster by the growth of the shell?—You may for three or four years, but not afterwards for certain; it is much the same as a horse's front teeth.

60,005. Is the addition every year distinctly marked?—No, not distinctly; it is indistinctly marked. If you take 50 oysters, you may trace it in some, not in others.

60,006. (*Professor Huxley.*) Have you any notion of what the price of French oysters is when they are ready for the market?—About five francs a hundred; some three or four years ago they were cheaper, two francs a hundred. Every year they are getting more and more dear.

60,007. So that we now understand that the whole capital required for setting up one of these oyster breeding places is so much as is required for clearing the ground in the first place; then so much as is expended in the purchase of tiles and in covering them with cement; and, finally, so much as is expended in labour for laying down the tiles, for collecting the oysters afterwards, and for raking over the beds on which the oysters are deposited?—Yes, and for watching.

60,008. Why is there any necessity for watching?—There are thieves everywhere.

60,009. Are you able to give us any notion of the proportion of cost per 100 or per 1,000 oysters, and the amount of capital required to be expended in that way in order to produce 10,000 oysters?—I cannot, but this diagram will give you the result of my labours over in France.

60,010. It shows the product of the parks in the Isle of Re and their value?—Yes.

60,011. Will you read it?—Total area of the island, 8,512 hectares, or 20,942 acres. Inhabitants, 18,000. Value of products in oysters, 113,382 francs, or 4,535*l*.

60,012. Is that the value per annum?—It is the value of the export of oysters for one year from the Isle of Re. I called at the office of M. Tayeau, Chief Commissioner of Marine. He told me that it is very difficult to get any satisfactory returns from the oyster

proprietors, as they were afraid of showing their profits. The following is the return sent in to the French Government by M. Tayeau for the year 1863. It was obtained with great difficulty, and even now is not exact. From this return, we learn that in 1863 there were exported oysters from the Isle de Re to the value of 113,382 francs, or 4,535*l.*

60,013. What would you consider an average produce?—That I do not know.

60,014. The figures you have given us are for a good year?—Yes.

60,015. The value of the annual produce of oysters in a good year is 4,535*l.*?—Yes, 113,382 francs, or 4,535*l.*

60,016. How many beds did you say there were there?—There are 2,000 parks.

60,017. Are they collecting parks or *claires*?—Collecting parks.

60,018. How many *claires* will there be?—I do not know exactly, but I believe about 600.

60,019. How many persons are there possessing those *claires* and collecting places?—I am told over 1,200 persons.

60,020. (*Mr. Lefevre.*) Is the sum of 4,535*l.* the whole value of the produce of oysters from 2,000 parks?—Yes.

60,021. That appears to be a very small amount for 2,000 of these parks. I think there must be some error there. Would not 2*l.* be a very small return from each of the parks?—2*l.* would not be a small sum considering that there is very little expended for labour.

60,022. Do you not think that the sum of 4,535*l.* rather represents the net profit of the parks after paying all the expenses?—It represents only the value of oysters born and fatted in the island and exported.

60,023. But the produce of those parks, if your figures are correct, compared with the sum received by the Whitstable Company from their grounds is a mere song.—There is no company there.

60,024. If these parks only produce a little more than 4,000*l.* a year, it is a mere trifle compared with the produce of the beds belonging to the Whitstable Company.—The following table has been published in a pamphlet by M. Coste and Dr. Kemmerer. It gives the following:—

Park generators - -	2,424	
Mud ponds for fattening -	839	
Average number of oysters in the mud ponds - -	1,026,282	
Average number of oysters in the parks - -	74,242,038	
Average revenue of the parks	1,086,230	francs.
Average revenue of the mud ponds - - -	40,015	„
Hectares of ground in the parks	140	
Ditto on mud ponds	6	
Proprietors of oyster beds -	1,700	

60,025. (*Professor Huxley.*) Is there any other place which is used for the purpose of forming *claires* in the Isle of Re, except at Loix?—Yes; the principal place is Loix, but there are other *claires* at Ars.

60,026. How long has this system been going on in the Isle of Re?—Since 1858, I believe.

60,027. Were there, before that time, no artificial means of collecting brood or *claires* on the island?—I believe not, until they were laid down by M. Bœuf. He was the first who hit upon the idea, but it would never have come to anything, if the learned Professor Coste had not taken the matter up, and worked it scientifically, and the public are under great obligations to him.

60,028. Did it first occur to him to collect the oysters in that way?—They collected themselves when M. Bœuf was making a new park, and he caught at the idea, and formed a park for them to breed upon. I believe he was building a new sea wall, and that the young oysters collected upon it. The fact became impressed upon the mind of M. Bœuf, and he subsequently turned it to account.

60,029. Since that time, has the process been found to be profitable?—Yes.

60,030. And the system has increased to a very great extent?—Yes.

60,031. So that, at present, the oyster parks laid down upon that plan are said to yield between 4,000*l.* and 5,000*l.* a year?—Yes, according to the only return I could get.

60,032. Is there found to be any practical limit to the number of oysters which can be laid down upon the *claires?* Is it found that the system will not answer, if they go beyond 100 oysters to the square metre?—They have large open pits, where they used to make salt, but the salt trade has been comparatively abandoned, and they use the old salt pits for *claires*, so that they are already made.

60,033. (*Mr. Lefevre.*) Do they purchase any oysters from a distance, for laying down on the *claires?*—Yes, when they can get them.

60,034. Have they been purchasing any during the last two or three years?—I cannot say, but I believe that, at one time and another, they have had a good many oysters from Falmouth.

60,035. Has that been in consequence of the failure of the brood on their own banks?—I do not know. It was the Mayor of Ars who had them.

60,036. What kind of persons have a property in the oyster parks and *claires?*—They are all obliged to obtain a licence.

60,037-8. Are they the peasantry who have them?—Yes, generally; but that is not always the case. For instance, in one place, I found M. Louis Perier, curate of Ars, working upon them, and his brother, a respectable town councillor, was also working upon them.

60,039. Is there any considerable number of the population supported by these parks and *claires?*—I do not think so.

60,040. Then do they occupy themselves in working upon them in the intervals of agricultural labour?—Yes.

60,041. (*Professor Huxley.*) How do they acquire a right of property in the brood grounds and *claires?*—They apply to the Government for permission to cultivate so much ground.

60,042. And obtain a licence?—Yes.

60,043-4. Do they apply for a particular area?—Yes; they go to the office of M. Tayeau, Commissioner of Marine, who has all the charts and plans, and say they want a certain ground marked out.

60,045. Then does the Government claim an absolute right over the foreshore?—Yes.

60,046. Under what conditions are licences granted?—They are granted under very bad conditions indeed.

60,047. What are they?—The Government can take them away again, if they choose, and that is a great obstacle to the proper development of the system; in fact, the owners are "tenants at will." Many people will not go on with oyster culture there on that account. The Government claim, for instance, every drop of sea water; and although a man may be getting on very well with his park, the Government can step in at any time, and dry it for a dock or anything of that kind.

60,048. Do they make them pay anything considerable for the licences?—I do not think they pay anything. The "Inscrits de la Marine" have the preference in choosing parks.

60,049. They are very much like our Coast volunteers?—Yes; they have the preference.

60,050. How does the granting of licences for the parks and so forth affect the rights of the fishermen? Is any one allowed to put a stake-net over one of the parks?—There are no fish to catch there.

60,051. There is no trawling carried on there?—No, nothing of the sort.

60,052. Are there no fish of any kind?—No; there are sardines, but they are some distance out at sea. I saw no trawlers or other fishing boats in the port of St. Martin.

LONDON.

Mr. F. Buckland, M.A., M.R.C.S.

16 March 1865.

60,053. Then there is never any collision there between the rights of the oyster men and the other fishermen?—No.

60,054. With respect to the inland lagoon, are there no collisions there?—No.

60,055. No question ever arises which is calculated to produce a collision?—No, not that I ever heard of.

60,056. Can you inform us if there is any difference in any other parts of France in the mode of oyster culture adopted?—No; that is the only part of France I have been to. I have some of the tiles that were brought over to England by way of experiment, to see if they would answer. Mr. Wiseman had them laid down at Paglesham, and this (*producing a tile*) was the result. He also found that they collected the mud. The tile is one solid mass of barnacles from end to end.

60,057. Were there any natural oyster beds in the neighbourhood, from which he expected to get spat?—Plenty; but the barnacles you see upon the tile took up the place where the oysters ought to go.

60,058. How long did it take to collect these?—About two months.

60,059. Is not all the coast about the Isle of Re covered with barnacles also?—No; there are very few.

60,060. Not upon the rocks?—No.

60,061. (*Mr. Lefevre.*) I think you told us that one of the oyster breeding places was on the outside of the Island of Re?—Yes.

60,062. Is that very different from the grounds inside?—This year it is.

60,063. Is it different in its conditions? Is it much more exposed than the others?—Yes, it is, and I will give an explanation of that. This year the oyster spat has entirely failed on this, the east side of the island (*pointing to the map*), but upon the west side of the island there has been more spat than on the east.

60,063*a*. How is that?—I had a great deal of difficulty in finding out why it was, but I did succeed in finding it out.

60,064. To what do you attribute it?—To the wind. The winds blow there pretty hard, and, unless the surface of the ground is perfectly clean, the oysters will not adhere to it. If there is the least bit of mud upon a surface to which an oyster is about to attach himself, he will not adhere. Now, this year the wind has blown from the northward towards the land, and the consequence is that the oyster parks on the east side of the island La Moulinade have been covered up with mud, and the oyster breeding places also have been covered up with mud. But "it is an ill wind that blows nobody good," and the same wind that brought the mud here (*pointing*) took it away from the west coast at Chanchardon, as the island is very narrow.

60,065. Are not the parks on the outside much exposed to the waves?—Yes; frequently the great big rattling Atlantic waves come in; but the place where the parks are laid down is partially defended by a point of land.

60,066. Are there any beds covered with pottery there?—Yes.

60,067. Is it found that the oysters breed there?—Yes.

60,068. To any extent?—Yes, in quantities, in good years.

60,069. Are the beds covered at high-water?—Yes, about the same as the beds in the interior.

60,070. Have you made any inquiries at the Isle of Re, about the breeding season and the success of the different seasons there?—Yes, I have.

60,071. With what result? Can you give any information upon the subject?—In 1858 there was a good spat of oysters; in 1859 it was also good; in 1860, good; in 1861, good; in 1862, bad; in 1863, bad; and in 1864, bad.

60,072. So that there has been a failure during the last three years?—Yes.

60,073. Was there a good spatting season outside in the summer of 1864?—Yes; comparatively so.

60,074. But it was not so good in the interior?—No; the general spatting season was bad.

60,075–7. Then there was the same deficiency of oysters there for fattening purposes as there was in the mouth of the Thames?—Yes, there was just the same deficiency.

60,078. (*Professor Huxley.*) There has been no good spat in the Thames since 1858, and in the Isle of Re there seems to have been the same deficiency during the last three years as there has been in the Thames?—Yes, and they give several reasons for the deficiency of spat. I have inquired into the matter, both at the mouth of the Thames, and also in Ireland and at the Isle of Re, and I believe that the whole question turns upon the temperature. There are other things, no doubt, which have a tendency to destroy the spat. Indeed, there are nine or ten enemies of the oyster altogether, but the principal thing, in my opinion, is the temperature.

60,079. We should like to have from you an enumeration of the enemies of the oyster?—That is a very important consideration. The enemies of the oyster I divide into two classes, the living and the dead, but first of all among the enemies is the temperature, the cold water.

60,080. A low temperature?—Yes.

60,081. What is the lowest temperature the oyster can bear without injury?—I have made a series of experiments on that matter, and I could tell you to a degree. You must excuse me, however, if, at present, I refrain from answering the question. I can, however, tell to a degree when the oysters will live and when they will die. A high temperature is favourable to them.

60,082. What is the next enemy after a low temperature?—Cold water.

60,083. What do you mean by "cold water"? Is not that part of the temperature?—I mean the effect of snow water coming down from the hills on to the oyster beds.

60,084. Cold fresh water?—Yes, or cold salt water either.

60,085. Apart from the coldness of the water, will not a sudden flush of fresh water on the beds expose them to great damage?—Yes, and it will make the oysters very thin. Upon one of the oyster banks at Galway, the Galway river comes down, and at a distance of 200 yards from the mouth of the river there are plenty of oyster beds, but the oysters are wretched things, as you will see from the specimen I produce.

60,086. Be so good as to go on with your enumeration of the enemies of the oyster?—The first enemy is too low a temperature; secondly, the currents.

60,087. When the currents are too strong?—Yes. When the spat of the oyster is being deposited, too great a current running over the beds would sweep it all away.

60,088. It would disperse the spat?—Yes.

60,089. What is the next thing?—Thirdly, mud; an invasion of mud is fatal. Fourthly, a sand storm; the way that the sand kills the oyster is by getting inside. He can stand a certain amount of it, but if it gets between the hinges of his shell he is not able to shut his mouth and he is soon killed.

60,090. You mean a sudden drift of sand in the water?—Yes. The oyster beds in the mouth of the Thames are very liable to that, particularly at Southend. Then we come to the living enemies, and the principal one is the five-fingers.

60,091. The star-fish?—Yes. The second is the whelk tingle.

60,092. The *Purpura*?—Yes.

60,093. Do you find that the *Purpura* pierces the shells?—Yes.

60,094. Or do they get between the valves?—They cannot do that.

60,095. Do you find that they commonly perforate the shells?—In all cases they do so; it is their mode

of killing oysters. Mr. Wiseman collects them and paves his garden with them.

60,096. Do you find the large whelk—the *buccinum*—injurious?—Not at all; he is carnivorous, however, and will go in and eat the oyster when the shell is open. Mussels are very injurious. If the spat of the mussel comes and falls upon the oyster beds, it will spin ropes and collect mud, and the oysters are done for; it will also knit the oyster all together, like a spider winding his net around a fly. Then comes a very important enemy, but one which has not hitherto had much notice taken of it, namely, the mullet.

60,097. The red mullet?—No, the little grey mullet. I am talking of the oysters beds in France now, in particular.

60,098. Do they eat the spat?—Yes, so it is said; you may see whole beds marked out where the mullet has been grubbing for his food.

60,099. Is the spat found in the stomachs of the mullet?—I believe so; there were no nets there, however, and I was not able to catch a mullet.

60,100. Is that a well established fact?—Not well established, but I believe it is the fact. The bird called oyster-catcher is also said to be an enemy. The men at the Red Bank Burren bed, in Ireland, go out and fire guns, in order to frighten away the oyster-catchers. I examined the stomachs of some oyster-catchers, but I only found in them some perriwinkles and the valves of perriwinkles.

60,101. It would only be a very small oyster the oyster-catcher could take?—They say he opens it with his bill, but I do not believe it is possible.

60,102. Are there any other enemies?—I believe that cinders from the steam-boats are injurious; I fancy so, because oysters are not found in the tracks of the steam-boats running up and down the mouth of the Thames.

60,103. Might not that arise, to a certain extent, from currents created by the steam-boats in working up and down?—It might be, but at other places on the west coast, Milford and Swansea, where the steam-boats were accustomed to run, the same thing is observable. There is no spat to be found there where the steam-boats have dropped the cinders.

60,104. (*Mr. Lefevre.*) Will not the spat adhere to the cinders?—I believe it will, but there is something in the dropping of the cinders which interferes with the ground. Then, again, there are the waves.

60,105. (*Professor Huxley.*) Do the *Serpulæ* do much harm?—Yes, they take up good places where the oysters ought to fix.

60,106. Do you find that they accumulate very much on the ground, and block it up?—In certain years they do.

60,107. Then there is another marine worm that makes a sand tube, the *Hermella*?—That is what is apt to smother the oysters.

60,108. It makes a sandy tube?—Yes, and it is injurious. I mean those which build up a lot of sand into heaps.

60,109. The *Hermella* is a marine worm, which builds up sand tubes; does that occur on the English beds?—If it does, it must be injurious.

60,110. It is said to occur on the French beds?—Yes.

60,111. All these things are injurious to oysters?—Yes; and here is one that is a great enemy. Would you not think, upon looking at it, that it was a young oyster?

60,112. It looks very like one. Is it an *Anomia*?—Yes, it is the *Anomia*, or the crow, or saddle-back oyster. Mr. Ffennell would hardly believe that they would grow up to be an old oyster, but here is one.

60,113. You showed us just now some tiles covered with barnacles?—Yes.

60,114–6. Is that a common case?—Yes.

60,117. In what depth of water was that tile placed which is now covered with barnacles?—I believe it was dry at low-water at spring ebbs, but not at neap ebbs.

60,118. Do you find these barnacles on the natural beds?—Yes, all over the river.

60,119. In what depth of water?—From two to three fathoms.

60,120–4. And on the oyster beds at sea, with six or seven fathoms of water over them?—Yes, just the same, as I can show from oysters caught near the Dogger Bank. Mud is also injurious, inasmuch as it does not allow the oysters to stick. Here is a crab covered with oysters. It had a clean shell, and the oysters stuck upon it. That is very common with crabs, but they are generally *anomias* which are found adhering in that way. Here is a curious preparation for oysters. It is a piece of a fisherman's boot from the North Sea, with oysters stuck upon it. I am writing a book about oysters, and all the particulars about the enemies will be given there.

60,125. M. Coste has published a pamphlet, in which he expresses most sanguine views with regard to oyster culture. Have those expectations been borne out by actual practice?—No. M. Coste did not know that the failure had been so universal when I saw him in September. For the last three years the failure has been general everywhere.

60,126. M. Coste did not take into his calculations that practical difficulty?—No, it never entered his head, at least, I imagine so, though he is a most learned and scientific man.

60,127. Have you been at Cancale?—No.

60,128. That is merely a fattening ground?—Yes, I believe so.

60,129. There are a number of breeding places on the French coast?—There are some in the Isle of Re, and others up here at St. Brieuc, at Belle Isle, the Isle of Oleron, and other places. M. Tayeau marked all these places on the map himself for me.

60,130. With regard to the English grounds, are you aware that any system similar to that pursued by the French is adopted in England or Ireland?—I know only of the experiments of Mr. Wiseman, at Paglesham, and the experiments at Southend, conducted by Mr. Mitchell, Secretary to an Oyster Company, lately established under excellent auspices. I believe that at Southend they caught but a dozen or so of spat on 1,000 tiles. But, of course, if you have not got any babies it is of no use providing cradles. It does not follow that the system has proved to be a failure, because there are no oysters to catch. Near Exeter, some tiles have been laid down by Mr. Ellis, and my friend, E. Power, Esq., of Tramore, county Waterford, has also tried the experiment this last season.

60,131–4. It is obvious that the first thing to do, in establishing one of these beds, is to see that the subordinate conditions are such as to allow the spat to grow?—It is necessary to think the matter over carefully at first, in order to ascertain if all the conditions combine. That is the first question that ought to be settled. Unless the natural advantages greatly outbalance the natural disadvantages there would be no use in making any preparations.

60,135. Supposing that it would be an advantageous process, are you aware of anything in the state of the English law, with regard to foreshores, which throws an impediment in the way?—I am not a lawyer, but I believe that the English Government would make you pay rent for the use of the foreshore.

60,136. Are you acquainted with the attempts which have been made for some years past to establish oyster parks here?—I only know of the places I have mentioned, and, in all instances, the oysters have been deposited upon private grounds. They were only experiments.

60,137. Do you suppose, from your examination of the English coast, that it would be practicable to establish, on different parts of the coast, oyster beds or oyster parks, or the like, on a sufficiently large scale to supply the country with oysters?—Yes, there are, doubtless, many places in England which are admirably suited for the purpose; but it is not advisable to in-

LONDON.

Mr. F. Buckland, M.A., M.R.C.S.

16 March 1865.

stitute any experiments, unless the place has been thoroughly examined by a scientific person well acquainted with the process. In Ireland the question would be easy, but in England, I am inclined to think, they would make you pay rent. In the Herne Bay Company, in which I am much interested, the Government wished to charge us for the use of the bed of the sea a long way from the foreshore. Of course we say, "We will pay you for the foreshore," and if we lay down oyster parks we are to pay them; but what we object to is to be called upon to pay for the use of the bed of the sea.

60,138. In the case of the Herne Bay Company, is it quite clear who has the right to the foreshores?—The Crown claims the right, but it is also, I believe, claimed by other persons.

60,139. (*Mr. Lefevre.*) You have obtained an Act of Parliament enabling you to have the exclusive right to the fisheries on that foreshore?—Yes.

60,140. Then the Crown comes in and wishes you to pay something for the ground?—Yes, after all the question is settled, the Crown comes in and says, "You must pay us for the use of the bed of the sea."

60,141. They claim the ground, Parliament having given you the exclusive right to the fishing?—Yes; they want to charge us a heavy rent for the bed of the sea.

60,142. What do they want to charge?—They talk of something like 700*l.* a year, but nothing is yet settled.

60,143. (*Professor Huxley.*) You are in the estuary of the Thames?—Yes, we are.

60,144. (*Mr. Lefevre.*) Will you tell me roughly what the extent of the ground is you have there?—It is marked down upon the map. Here (*pointing to the map*) is the Herne Bay Fishery, and here is the mouth of the Thames. That is Whitstable, and that is Faversham. This (*pointing to the map*) marks out our ground. The area is 9 miles 90 acres.

60,145. (*Mr. Lefevre.*) What is the breadth?—About one mile—eight furlongs, I think.

60,146. (*Professor Huxley.*) You obtained an Act of Parliament giving you the exclusive right of fishery over that area?—Yes.

60,147. The Crown now wants to make you pay a rent for the use of the ground?—Yes. The Crown says, in point of fact, "Pay us 1,000*l.* a year for "putting your oysters down in the deep sea." We object to that, and we ask what right they have to make such a charge.

60,148. You never proposed to catch oysters on this particular ground?—Oh yes, we expect to do so.

60,149. Is it ground covered with oysters?—No, it is an uncultivated ground.

60,150–3. What have you obtained the right to catch?—We have obtained a general right to catch anything there may be there. We have obtained a right to the exclusive use of this ground. We have a right to cultivate it and to lay down oysters, and we have a right to catch all the oysters that may be found there.

60,154. Then how could the Crown afterwards ask you to pay rent for that ground?—The rights of the Crown were reserved. The Crown claims the right to the foreshore, and it is also claimed by private persons.

60,155. (*Mr. Lefevre.*) Is it the case that the Lords of the Manor claim rights over a certain portion of the foreshore, and that you expect they will claim rent also?—Yes.

60,156. (*Professor Huxley.*) Then all you have secured to you at present is the concession of the exclusive right of fishing?—We have absolute rights to the use of the ground.

60,157. But you must not exercise them without paying for them?—So the Crown says.

60,158. Do you propose to carry out the French system upon that ground?—We shall try it, certainly.

60,159. You propose to lay down tiles and other things, and to get oysters from such sources as are afforded by the surrounding waters?—Certainly.

60,160. Do you propose to bring oysters there to breed?—We have brought them there in considerable quantities.

60,161–3. For the purpose of feeding or breeding?—For the purpose of fattening and breeding too, of course. We are going to work hard at the French system, and we intend to lay down parks and possibly *claires*. We also intend to keep up a system of dredging so that the ground may always be clean.

60,164. (*Mr. Lefevre.*) When there was a good spat upon the flats in the neighbourhood of the Herne Bay ground, was there a considerable amount of spat found upon this very ground?—Yes, upon the lower part of it.

60,165. Was not that spat supposed by the Whitstable people to come from their oysters?—Yes. I will now place before you what I have observed with regard to the Thames. This is a map which I have made with the assistance of Mr. Wiseman, and it shows you the character of the ground in the whole of the mouth of the Thames. This (*pointing to the map*) is the mouth of the Thames, and these are the Maplin Sands.

60,166. (*Professor Huxley.*) You call the mouth of the Thames a line drawn between Shoeburyness and Sheerness?—Yes. In the first place, I have been down the Thames, and I have taken the specific gravity of the water all the way down. That, I think, is a very important matter.

60,167. As indicating the quantity of fresh water in the river?—Yes.

60,168. When was it?—In July.

60,169. What was the result?—The result was as follows: a little below Woolwich I found the specific gravity of the water to be 1004; off the Dartford Marshes, 1010; at Gravesend, 1014; Lower Hope, 1016; Blyth Beacon, opposite Halstow Marshes, 1018; Fairway Channel, 1021; the Nore, 1024; a little further on, at East Cant, 1024; and when we got round the North Foreland it gradually got to 1026.

60,170. At what times of the tide were those specific gravities taken?—The tide was going down the whole way. I was upon a steamer at the time, and the temperature was 59.

60,171. You took the whole in one tide?—Yes, the tide was going down the whole of the way.

60,172. How many series of observations were taken?—Only one.

60,173. With one ebb tide?—Yes.

60,174. Surely the amount of water would affect the question very much?—No doubt.

60,175. You would have to take a good many observations to be safe?—I only took my observations upon that one occasion. I will now point out where the chief grounds are situated. Beginning on the north side, all you see coloured red on the map is private ground. First of all, we have the Ipswich river, the Orwell. The ground there belongs to the Ipswich people, but they do not make as much use of it as they might. I believe the reason is that they have no money. Next to Ipswich river, we have the River Colne. That is cultivated by a company on the parts marked red; that marked blue is common ground, which is free for any one to dredge. All out here (*pointing to the map*) is public ground, where young oysters are caught.

60,176. Where oysters naturally occur?—Yes; and the young ones are caught. The river Stour, I believe, has no oysters in it at all,—not naturally; but Mr. Wills has laid down oysters there, but I have heard they proved a failure, on account of the mud. Lower down, at Handford, we find a public ground. Then we come to a great tract of country, from the Naze, stretching all the way down from the mouth of the Colne and the Blackwater to the Thames. All that is public ground, where they collect spat.

60,177. Is that ground largely covered with oysters?—They collect the spat there. For the last

three years there has been nothing to catch, but when there is a good spat, it is found there.

60,178. They are allowed to dredge that ground in the dredging season?—Yes.

60,179. Is it open to everybody?—Yes. That (*pointing to the map*) is where the Commissioners were the other day, at Brightlingsea. Every inch of that is private property. We then come to the Blackwater. That is all public property.

60,180–2. Any one may dredge there?—Yes. "Commons" is the local expression applied to that ground. All that is "commons." Then we come down to the River Crouch, and there again we find a great quantity of private ground. Then we come to Paglesham Creek. The ground there is used as a spatting ground, and oysters are laid down there ready to transport and send away. Then, between that red mark on the map and the next red mark (on the River Roach), there is a great quantity of "commons." It is proposed, by a bill now before Parliament, to take in that common ground, and my opinion is that that ought not to be done, because it is evident that the oysters found there must be the lambs that get over the fold here (*pointing to the map*).

60,183. (*Mr. Lefevre.*) That same argument was used against you in the Herne Bay case?—I know it was; but the Herne Bay ground is situated in the open sea.

60,184. You cannot quite trace the oysters on the Herne Bay ground to the parent oysters, as you can on the ground you refer to on the Essex coast?—No; on the Herne Bay ground they may be wild oysters, coming from anywhere, but on the Essex coast they can come from nowhere else. Then, outside the Maplin Sands, you have a few public oyster grounds, and then you come to the ground that is called "the flats."

60,185. What is the extent of the flats?—I have not got the measurement, but it is a great open space, where the oysters are found upon public ground.

60,186. (*Professor Huxley.*) It is from those flats that the Whitstable beds have been primarily supplied?—Yes; and they also buy young oysters from the Essex side, and lay them down on the Kentish beds.

60,187. You propose to do at Herne Bay what the Whitstable people have been doing in reference to their ground?—Yes.

60,188. Do you take oysters from the same locality?—Whenever we could, we have brought large quantities from the west of England.

60,189. Then your special object is not the promotion of the French plan of oyster culture?—We shall try it. We shall do our best to make the same or an analogous system of artificial cultivation answer here; but we shall do something else, and keep the ground clean by constant dredging. The oysters found here (*pointing to the map*)—at the Flats, in the mouth of the Thames, are found because there is no mud. And why is there no mud? Because dredging has been perpetually going on there. The ground has been dredged for other things.

60,190. Not for oysters particularly?—No; people have been engaged in working there for cement stone, and by that means the ground has been kept clean. The consequence has been that the oysters, instead of falling into mud and being destroyed, were able to adhere.

60,191. You speak of the dredging of the ground. What is your opinion as to the effect of the present law upon that subject?—The law prohibiting dredging during the close time?

60,192. Yes. Suppose that dredging were prohibited during the close time, what would be the effect?—The close time is now, I believe, according to the Convention Act, the months of May, June, July, and August.

60,193. Yes. From your practical knowledge of oysters, supposing that all dredging were prohibited on those beds and upon the Herne Bay ground, for example, during May, June, July, and August, what, in your opinion, would be the effect upon the oysters?—They would be ruined.

60,194. In consequence of what?—In consequence of there not being a clean surface for the oysters to adhere to. If there is the least mud, the least coating or trace of mud, the little oysters cannot adhere. Therefore, before the oysters spat, the ground ought to be made as clean as it can possibly be.

60,195. Have you had anything to do with the deep sea oyster beds?—No.

60,196. Does the Herne Bay Company propose to get any supply for its parks from the deep sea oyster beds in the Channel?—No; they would be of no use. We cannot sell an oyster any bigger than that (*producing an oyster*).

60,197. Could you not get small oysters from the deep-sea beds?—These are native Herne Bay oysters, that live naturally on the Pansand. They are a fine class of oyster, with a deep shell. They are, indeed, a beautiful oyster. It is these creatures, I believe, which deposit the spat out here, which is driven by the tide upon the Herne Bay beds.

60,198. Would it not be worth while to get small oysters from the deep sea, and bring them in?—The further you go from the shore, the coarser the oysters become.

60,199. If you get a young oyster and bring him in, will you not make a fine oyster of him?—Yes, but he must be very small.

60,200. (*Mr. Lefevre.*) You are not allowed to bring in oysters from the Channel of less than $2\frac{1}{2}$ inches in diameter?—No, I believe not.

60,201. So that you cannot get him until he is of an age that renders it no longer worth while to attempt to convert him into a good oyster?—We buy them as half-ware when they are about $2\frac{1}{2}$ inches across. That will be about the size you mention. In fact, here is one, and it is about that size.

60,202. (*Professor Huxley.*) I suppose that will be about $2\frac{1}{2}$ inches?—Yes; and that is about the size of those which are laid down.

60,203. You bring them in of that size, but not smaller?—Yes.

60,204. If you get them of that size, do you train them up into natives afterwards?—I do not think they would ever become altogether natives, but you can train up the young of them.

60,205. If you could dredge up oysters of a smaller description, could you improve them into good oysters?—I believe they might grow up, and might assume something of that character. Here is a Milford oyster, which was brought in and laid down for two months in Herne Bay, and which increased between 30 and 40 per cent. in that time.

60,206. That is only $2\frac{1}{2}$ inches across?—Yes.

60,207. At present there is a restriction as to the size of the oysters to be taken from the natural oyster beds?—Yes.

60,208. They are not to be less than $2\frac{1}{2}$ inches in diameter?—No.

60,209. In your opinion, does that restriction operate injuriously upon the trade of oysters, that is to say, that if you are only allowed to catch them of that size, are they then small enough to enable you to convert them into good oysters?—Yes, certainly.

60,210. You do not want them less?—We would not take them, if you would give them to us; they would die.

60,211. Why would they die?—They would not be strong enough to carry long distances.

60,212. They would not bear the transport?—No. This oyster I hold in my hand shows how oysters will increase by fattening in Herne Bay.

60,213. Would it be worth while to bring in large oysters from the deep sea, and to lay them down for breeding purposes only?—No, I think not. Each oyster will give you a very large number of young ones, but that number has been very greatly exaggerated. It has been said to be 1,500,000.

60,214. How many young do you think one oyster will produce?—I do not know exactly. I have

LONDON.

Mr. F. Buckland, M.A., M.R.C.S.

16 March 1865.

weighed them. I find that the produce of one oyster will go from 400,000 up to 800,000.

60,215. 400,000 is the lowest?—Yes, that is the lowest, 424,000, and the highest was 829,000.

60,216. If you were to import deep-sea oysters in the breeding time, just ready to spat, and lay them down in the immediate vicinity of an oyster park, so that the spat when it fell would be distributed chiefly over the park, and if you were also to take proper means for collecting the spat, what would the result be? Has that experiment been tried?—No; people do not care about those oysters; they are nasty coarse things.

60,217. But could you not improve them?—The answer to your question is, that when there is a fall of spat there are so many young oysters floating naturally in the water that it would not be worth while to bring in coarse oysters to spawn.

60,218–9. When there is no spat, would it not be worth while?—But at such a time the young deep-sea oysters would die equally. I think that an oyster, like a salmon, must produce its eggs, and when the proper time comes the young oysters are thrown out like a cloud of smoke. Then, if the proper conditions be there simultaneously, the oysters fix themselves, but if one of the conditions be wanting, then they die. That, I believe, is what happened this year.

60,220. The failure of the spat is not due to the infertility of the oysters, but to the destruction of the young?—Yes, by natural causes.

60,221. If you were to take the trouble to import breeding oysters, you are of opinion that the young would be destroyed by the same causes?—Yes, equally.

60,222. And in that case you would only lose your labour?—Just so. The great thing is to have the ground clean, and, therefore, you ought to dredge before the young oysters are born, and the young oysters are spatted principally in June and July. Therefore, the ground ought to be allowed to be dredged a little before that time, and you cannot dredge over the oyster beds too much.

60,223. Is there anything in the state of the law that interferes with what you consider to be the beneficial working of the oyster beds?—I believe that the months of May and June ought to be given up to the people, so that they may be able to dredge in the open sea, because it is about July and August that the oysters are principally spatting in the open sea. Then I would take care of the oysters in the months of August and September, because they are weak then.

60,224. You would allow the fishermen to dredge in May and June, before the oysters are spatting?—Yes.

60,225. For what purpose?—To clean the ground for the young oysters.

60,226. They are not fit for eating at that time?—No.

60,227. Then they would dredge merely for the purpose of cleaning the ground?—Yes, previous to spatting. The moment I saw an oyster come up in a spatting state I would put a stop to dredging; but I would go on cleaning the ground until the first spat is seen; then I would leave off directly.

60,228. Would not the people bring in the oysters they dredged up and sell them?—They would have no business to do so.

60,229. How would you prevent them, if you allowed them to dredge? You think it would be injurious?—It would be good for the beds outside.

60,230. Even if the oysters were taken?—Yes, because they cannot take all. If there is a good spat, you may clean, as you imagine, every oyster off the ground, and yet there will be plenty of spat left.

60,231. Have you positive facts tending to show that?—I have positive facts showing that if you do not dredge before the oyster throws its spat, there will be no place for the spat to fix itself and it will all die.

60,232. Can you give us a case in point?—Here is a sample from Rossmuck Bay, on the west coast of Ireland. There, I believe, they dredged in the early months, and the consequence was that the ground was clean for the spat. The oysters are taken from that ground, which is a beautiful breeding ground, and laid down on another ground that is good as a fattening ground. That is one of the reasons why they have always oysters on those grounds on the west coast of Ireland. There are a lot of little bays, and the oysters cannot get out.

60,233. What you speak of rather interferes with the deep-sea fishing, and not with persons possessing private parks. Is there anything that interferes with the working of the grounds belonging to private companies?—There is nothing to interfere with the working of the ground at Herne Bay, I believe; and I shall strongly advise the Directors of the Herne Bay Company to have boats hard at work at the beginning of May and throughout the month of June, in order that the ground may be made ready for the spat when it falls.

60,234. (*Mr. Lefevre.*) You are aware that the Whitstable Company dredge their ground all the year round, except when they see that spat has fallen upon the ground?—Yes, and that is quite right.

60,235. (*Professor Huxley.*) Is there any good reason for leaving off dredging them?—I would not leave it off too long.

60,236. Do you think that the passing of the dredge over the ground, when the young spat is falling, would injure the spat?—Mr. Wiseman can, perhaps, answer that question. (*Mr. Wiseman.*) I think not.

60,237. Is it likely to do harm to the thin shell of the young oysters?—I think not. We find that the more we work the ground when the spat is falling, the more spat we have. I do not think that any injury is ever done to my grounds by dredging.

60,238. Even when you have observed that the spat has actually been deposited, and that it is adhering to the stones?—I lay by for a month, but there is a friend of mine who works all the year round, and he has more spat than I have.

60,239. Then you are of opinion that it is advisable to go on dredging all the year round?—Yes.

60,240. Do you think that raking up the ground when the spat is just adhering to stones and culch is not injurious to the young shell of the oyster?—I do not think it is injurious. I left a piece of my ground unworked for a month, and the consequence was, as I told you at Brightlingsea, that it become covered all over with a green weed.

60,241. Are you aware that the Whitstable Company cease dredging during that month in which they observe by the microscope that the spat is being deposited?—I was not aware of that circumstance.

60,242–3. (*To Mr. Buckland.*) Do you think that the system of oyster culture which you have described to us is capable of being developed upon the Essex coast?—I think there are many places fit for it, but I think that our culch found at the bottom of the sea is a very much better thing. The natural culch found here will outweigh all the French tiles and those other things which I have described, by a long way. There is no culch in the Isle of Re.

60,244. None at all?—There is no good natural culch in the Isle of Re. It is either sand and mud or else pure mud, and if they did not lay down something for the oysters to adhere to they would not catch them at all. They look mainly to an artificial culch.

60,245. (*Mr. Lefevre.*) Then oyster breeding in the Isle of Re amounts to this, that they provide artificial culch?—Just so.

60,246. In the mouth of the Thames they have that culch naturally?—Yes.

60,247. There is no necessity then for the artificial breeding of oysters there?—Yes, there is.

60,248. Why?—It is very true that there may be culch in one place, but there may be none in another,

and in that case I would say, lay down your tiles. Yet within six yards of where you put down the tiles, there may be plenty of culch. To illustrate the matter in another way, I may say that the French system might be well adopted for this street, Adelphi Terrace, but not for John Street, close at hand.

60,249. Do you think that the natural culch in the mouth of the Thames is better than the artificial culch in the Isle of Re ?—Yes.

60,250. Besides that, there is a certain portion of the ground which has no culch at present, but which ought to be provided with it ?—Yes, exactly.

60,251. Are you aware that there has been no spat for the last six years on the ground in the mouth of the Thames ?—Yes.

60,252. Have you formed any opinion as to the reason of that ?—It is simply a matter of temperature, I think. I cannot trace it to anything else. The ground has been ready to some extent, and the oysters have given up their young, but the spat has not fixed itself.

60,253. There has been dredging carried on all over this ground in the close season ?—Yes, just the same. But it is exactly as it is sometimes with the blossoms of the peach or apricot. They come out, but they are killed the next morning by the frost.

60,254. (*Professor Huxley.*) You think that the system of the artificial multiplication of oysters does not go back as far as the artificial propagation of fish ? The artificial propagation of oysters is the same sort of thing as if you were to set nets to catch the young parr of the salmon and then simply feed them ?—Yes.

60,255. The artificial propagation of oysters does not go as far as to catch the breeding oysters and breed from them ? That is not done anywhere ?—No.

60,256. Is there no trade in the taking up of breeding oysters, and supplying oyster parks with them ?—It would be of no use.

60,257. The experiment has not been tried ?—They have tried, as an experiment, the placing of one oyster on one tile and two oysters on two tiles, but they do not catch anything under.

60,258. They have tried the experiment of placing breeding oysters under the tiles ?—Yes. M. Coste had the same idea that you have. He thought the young oysters would come from the old oyster, and stick upon the tiles, but it has been found that they do not do so.

60,259. What has happened ?—They swim about, and I say it advisedly, for from 22 to 27 days. They do not fix themselves as soon as they come out from the parent oyster. The idea of many persons is that they attach themselves as soon as they come out, but it is no such thing.

60,260. Have you seen them swimming by means of the cilia ?—Yes, thousands of them.

60,261. Do they come to the surface of the water ?—They have the power to do so if they choose, but as a rule they keep close to the bottom.

60,262. Have you seen them forming a kind of scum on the top of the water ?—I have had pointed out to me what was said to be oyster spat forming a scum on the top, but it was nothing of the kind ; it was the young *Medusa*.

60,263. Are you fully satisfied as to their power of being able to move about from place to place in calm water ?—Yes, but blow the water with your breath, and they go along with it, and at night they are all down at the bottom. In the morning they are going up and down, exactly the same as a shower of snow.

60,264. They never congregate at the top but always at the bottom ?—Yes.

60,265. Has anybody tried the experiment of breeding oysters in a close pool of water ?—The experiment has not been tried, but the oysters have spatted in the *claires*.

60,266. What has been the result ?—Nothing.

60,267. In the *claires* the water will be shallow ?—Not so shallow.

60,268. How deep ?—From one to two feet.

60,269. Does the spat never fasten itself within the *claires* ?—They have put in tiles, but they have never caught anything. I can lay down as a rule, that oysters will not breed on artificial ponds, and that may save millions of money to people who are anxious to try the experiment.

60,270. They will not breed ?—They will breed, but the spat will not fix itself in the ponds. Mr. Wiseman tried the experiment at my instance last year.

60,271. Did all the spat drift out to sea ?—It vanished before one of its enemies.

60,272. (*Mr. Lefevre.*) Although you can collect the young of the oysters in a bottle like this I have in my hand, and they will live, there are no means of making them fix themselves on beds or anything else ?—No. If you find out a means of accomplishing that object, you might make 10,000*l.* a year with the greatest ease.

60,273. There are no means of making the young oyster fix himself when you have got him in a bottle ?—No, but I am anxious that you should not press me upon that question. I believe that one of these days the difficulty may be solved, and that some one will be able to take these creatures when alive under their care, and to provide for them the conditions which will enable them to fix. That is where I think that man, one of these days, will be able to step in; but it is a very difficult question and there are many things involved in it.

60,274. (*Professor Huxley.*) At present there is this great distinction between salmon breeding and oyster breeding,—the salmon you breed from the egg, and can save all the young, and stock a river with them, while in the case of the oyster you are obliged to trust to chance for getting what corresponds with the parr of the salmon ?—Yes.

60,275. You do not think that there are any means of solving that problem ?—I think there are.

60,276. At any rate it has not yet been solved ?—No. I wish I could solve it.

60,277. (*Mr. Lefevre.*) If so, you would breed against nature ?—That is what I want to do. I have now in my kitchen 30,000 salmon, and if I could take these 800,000 oysters and bring them up to a size that would ensure their living I should be able to sell them for any money. If I could only get them to live, and stick to something, it would be enough. It is not a question of space. I could turn them out afterwards. And he would be a bold man who would say that that will not be done some day. At the same time, I am not able to do it.

60,278–9. You are aware that the Colchester men dredge up all the brood they can find ?—Yes.

60,280. Do you think that they have left sufficient parent oysters to breed ?—Yes, plenty of them.

60,281. They have not taken all, so that it is impossible to have a brood ?—I think not. In the Isle of Re the oysters came from the sea beds outside. On the Essex coast it is the same. The oysters are born in various places, and they find their way upon the beds where they can be dredged. I am quite positive and certain that all the little oysters found on the common ground, marked blue on the map, come from there and there (*pointing to the map*). There are sundry oysters lying about, and if one of them spats and throws out 800,000 young oysters, there is no knowing where they will go.

60,282. Is it possible to dredge the ground so completely as not to leave an oyster for breeding purposes ?—Yes, where there is no spat.

60,283. But if there is spat ?—They cannot dredge it too much then. But if there is no spat, it is possible to take almost every oyster out of the place.

60,284. There has been no spat for the last six years. Do you think that, in consequence, the grounds have become so denuded that no parent oysters have been left for breeding purposes ?—No, the space is too large.

60,285. You think that there is still a sufficient number of oysters left to supply the ground with spat

LONDON.

Mr. F. Buckland, M.A., M.R.C.S.

6 March 1865.

in a good season?—Yes; and not only that, but they are vagabonds, and swim about for 27 days wherever the tide takes them.

60,286. (*Professor Huxley.*) The failure of the spat, you say, never arises from the actual failure of the brood, but from the destruction of the brood?—Yes, by natural causes.

60,287. That makes the remedy so much more difficult?—Yes. If you could alter the Gulf Stream, I think you might do good. I think that is the great mischief. I do not know what other cause there can be that can simultaneously affect the whole of the coast of the west of Ireland, the west coast of France, and the Channel. I cannot conceive that there is anything else.

60,288. (*Mr. Lefevre.*) Is it the result of your observation that there has been a failure of spat everywhere for the last three years?—Yes.

60,289. And for a longer period than that round the English coast?—My knowledge does not extend further than that. There has been a comparative failure all along the west coast of Ireland, and there has been only a very poor spatting up the Channel. Then, if you go down to the Bay of Biscay and the Isle of Re, you will find that there has been a failure there, and a failure here (*pointing to the map*). I know pretty well that the Gulf Stream comes up to about there. Indeed, Admiral Fitzroy told me so himself. What else can it be that causes the failure, except the Gulf Stream?

60,290. Do you think there has been a deficient supply?—I think there has been something wrong in the temperature.

60,291. (*Professor Huxley.*) Is the brood so very sensitive?—Yes.

60,292. More than the full-grown oyster itself?—Yes.

60,293. (*Mr. Lefevre.*) Where do you get the oysters from for the Herne Bay beds?—From the west coast of England, and other places.

60,294. What sized oysters are they?—They are oysters of all sizes.

60,295. Under $2\frac{1}{2}$ inches?—I don't know. This (*showing an oyster*) is about the average size of them. That is the size we like.

60,296. Is that the smallest you are able to get?—Yes.

60,297. (*Professor Huxley.*) I understand, from what you say, that when there is anything like a spat, you are content to depend entirely on the oysters on your beds?—Perfectly.

60,298. Then it does not matter to you what goes on in the deep sea?—No.

60,299. Not if the spat were dredged up altogether?—No; but we are not all the world. The common oysters eaten by the people do not come from our beds at all. The produce of the oysters eaten by the poor is about 124,000,000. They are sold for about four a penny,—that makes 125,000*l.* I give these figures on the authority of Mr. Mayhew's "London Labour and London Poor." They are nearly all Channel oysters. Whereas natives are taken to London, Paris, Berlin, St. Petersburgh, and other large continental cities.

60,300. In a good spat year, there is enough to supply that vast demand?—Yes.

60,301. (*Mr. Lefevre.*) Do not these remarks you have made with regard to the better description of oysters apply also to the Channel oysters, because, if there are beds where they can be laid down for fattening, there is the same relation between the Channel oysters and the beds on the coast as between the native oysters on the flats and the beds in-shore?—You ought to keep the beds in the Channel dredged, and not move the oysters when they are weak, in August and September.

60,302. If there were beds close at hand to which they could be moved without danger, would not the same reasoning apply as to the oyster beds here?—If you will look at the penny oyster shops, you will see, in the months of June, July, and August, that the oysters are spatting. They ought not to be allowed to be sent into the market then, and they are sometimes found in spat as late as September.

60,303. (*Professor Huxley.*) It has been mentioned to us that the deep-sea oysters do not spat as early as the other oysters. Some years ago, a deputation waited upon the Board of Trade, when I was present, and the fishermen affirmed that the spatting time was two months later?—The Shoreham people say so.

60,304. (*Mr. Caird.*) Do you think there is no difference, as to the spatting season, between the oysters in the deep sea and those deposited in more shallow water?—The deep-sea oysters spat later than the natives. The native oysters this year spatted up to Lord Mayor's Day, the 9th of November. They were very late, and be it remarked that the autumn was very hot.

60,305. (*Mr. Lefevre.*) Dredging for brood goes on on the flats and the ground off Colchester all the year round. I suppose they take a certain number of large oysters fit for consumption?—I think if you said dredging for cement stone you would be right. They go dredging for cement stone, but not for spat, because there is no spat to catch. But if a spat did come, there would be thousands got there.

60,306. But they would take the large oysters as well?—To be sure.

60,307. What do they do with them in the summer months?—Eat them, I think, or place them on the private beds.

60,308. Will they not fetch a good price in the market?—No.

60,309. The public will not take them when they are sick?—Not if they know it.

60,310. Will they eat Channel oysters when they are sick?—No.

60,311. Then there is no necessity for a regulation to prevent them from being taken?—There may be three sick out of a dozen. Some will have just done spatting; others will be half sick, and some three quarters.

60,312. (*Professor Huxley.*) Would you stop the sale of oysters because three out of 100 were sick?—Not if only three out of 100 were sick. The question, however, is a very difficult one to deal with, and what is wanted is some one to record daily, in an official manner, the condition of oysters, as regards their holding spat, from the month of May to the end of October, and oysters, both deep and shallow water, should be sent from different parts of the kingdom, for careful examination; upon facts thus ascertained, legislation might be founded. Some years the oysters spat very early, and some years very late. Last year they spatted early in May and June, and the young brood all died, for the reasons which I have given. But there was a second edition of spatting. The hot weather of July, August, and September caused another spat to come. I paid a man 3*d.* a-piece for sending me oysters ready to spat late in the season, and the last oyster I got in spat was on the 9th of November, Lord Mayor's Day. Mr. Wiseman's oysters were in spat in May, but I recollect that we had a cold spring, except ten days very hot weather in May, and a warm autumn last year.

60,313. (*Mr. Lefevre.*) What is the price of the Isle of Re oysters when fat?—Five francs a hundred. I believe that the price is rising.

60,314. Do you know whether any of the spat from the Isle of Re has been imported into this country?—No; I would not have it, if you were to give it to me. I am glad you have asked me that question. The oysters there have a vulgar bad shell, and they would be of no use to us at all.

60,315. Then you do not think that we are likely to have any supply for our native beds from France?—I would not have them, if they were given to me.

60,316. Are they not worth laying down?—Certainly not. In order to ascertain the money value of different descriptions of oysters, I made a rule to weigh the shells and to weigh the meat of every

oyster I could get hold of. I have now weighed upwards of 50 kinds of oysters from every part of the world, weighing a dozen oysters and taking the weight of the shells and of the meat. At the head of the list is the Whitstable oyster, which bears a proportion of meat and shell of one-fourth.

60,317. (*Professor Huxley.*) One-fourth meat as compared with the weight of shell?—Yes. Next came the Colchester oyster with a beautiful clean shell, one-fourth again. Then Mr. Wiseman's oysters, from Paglesham, one-fifth. They were green, I am sorry to say, from causes which I am now investigating. Next were the natural Herne Bay oysters, one-fifth, and these were not cultivated; Falmouth, one-sixth; Isle of Re, one-fifteenth. Like the French pig, they are very lean.

60,318. (*Mr. Lefevre.*) They are a very inferior article, as compared with the native oyster?—Yes. Look at the size of this one by the side of that.

60,319–22. Are you aware whether any spat from the mouth of the Thames has been exported to any part of France, for the purpose of being laid down?—No, but they buy all the oysters they can from the west of England, when there are any to buy, but there have been none to buy for a few years.

60,323. (*Mr. Lefevre.*) From your observations we are not likely to have cheap oysters for the next three years?—I think the time may come when an oyster may be a curiosity and be put under a glass case, if these things go on much longer.

60,324. But we are not likely to have cheap oysters of a large size for the next three years, even if a spat does come?—No. The markets are now being supplied from the spat of four years ago. That is gradually being drawn away, and there has been nothing since to take its place.

60,325. (*Professor Huxley.*) If this depends entirely upon the operation of natural causes, it does not appear clear that anything can be done to remedy the evil?—You can do a great deal in the way of preparing beds.

60,326. But as to making rules and regulations for securing a supply?—You can do nothing at all in that way.

60,327. Can anything be done by private enterprise in setting up parks and cultivating oysters?—Yes, if there is a spat. There are hundreds and thousands of places where the only thing required is knowledge and capital to carry the work out, in order to make it profitable. I am certain of that. If I went to one place probably I should say, "You have got culch; therefore you don't want tiles," whereas within two miles of the same spot, I might feel called upon to say, "You have got no culch; you must have tiles." It is ignorance and want of capital that keep these things back.

60,328. (*Mr. Lefevre.*) Are the fishermen generally in the habit of throwing the culch away into the Channel when they dredge it up?—Yes, they are very careful in that respect, I believe.

60,329. They are quite aware of the importance of leaving the culch upon the ground?—Yes; but I have heard that the Frenchmen carry it all away.

60,330. Does the carrying away of the copperas stones do any injury to the beds?—It does the greatest good in the world. It prepares the beds for the oysters.

60,331. They do not carry away enough copperas stones to injure the culch?—No, and they clean the beds.

60,332. (*Mr. Caird.*) The great point seems to be to preserve the spat in a good spat year by making due preparation for its reception beforehand?—Yes.

60,333. So that in a good year you may take advantage of the good spat and stock the beds for future years?—You must open your mouth and see what nature will send you, but you must prepare for a good spat.

60,334. The only remedy you can see for the present deficiency in the supply of oysters is the hope of a good spat, and when it comes the utmost means should be taken to secure and preserve it?—Yes, but that should be done before it comes.

60,335. There is no other remedy for the present deficiency that you see?—No. I wish I did.

The witness withdrew.

Daniel Russell called and examined.

60,336. (*Mr. Caird.*) You are well acquainted with the state of the oyster fisheries on the coasts of Great Britain?—At the present moment, I cannot say that I am well acquainted with them; I only know that there is a scarcity of oysters. I have had nothing to do with the oyster fisheries for the last five or six years.

60,337. I believe that in your early life you had considerable experience in connexion with the oyster fisheries?—I was brought up in connexion with them from my infancy.

60,338. To what part of the coast particularly has your experience been directed?—To the south coast of England, the French coast, the Bristol Channel, and the coast of Ireland.

60,339. In the course of your experience, what information have you gleaned as to the cause of a plentiful supply of oysters, or a gradual decrease and falling off in that supply?—In my opinion, legislation has been a most powerful agent in destroying the supply of oysters.

60,340. What do you mean by that?—I think that steam has had a great deal to do with it.

60,341. Steam?—Yes; steam has had a very great deal to do with it.

60,342. In what way has steam affected it?—It has enabled the French and British Governments to carry out laws, which, I am of opinion, have done much injury to the oysters.

60,343. Do you think that the law itself has been injurious?—Yes; it has been destructive, I think. That is the opinion which I have long entertained, but, of course, it is only a matter of opinion.

60,344. In what way has the law been injurious to the fisheries?—Perhaps, I had better tell you what my experience has been in the matter.

60,345. We should be glad to hear what your experience has been?—I am now more than 50 years of age, and I was in the oyster business when I was only seven or eight. I had a little to do with it even then, and at that time there were plenty of oysters on the south coast of England. I will not say to a year or two, because I have no documents to substantiate my statement, but up to 1838 or 1840 there were plenty of oysters; indeed, they were in great abundance all along the south coast. I think it was in 1823 or 1824 that a very large stock was found off Shoreham; it extended from above Shoreham Harbour to below Littlehampton.

60,346. Was that bed of oysters discovered then for the first time?—It was worked about that time for the first time.

60,347. Were the oysters diligently fished then?—Yes, and that lasted for several years. There was no restriction enforced in reference to the working of the oysters; they worked them in the summer months, and they continued working them in the winter also.

60,348. Were the fish found in a good condition for the market?—They were not fit for the market when they were first got up.

60,349. Then in that case, were they all carried and laid down upon private beds, in order that they might improve?—Yes.

60,350. How long did that continue to be a successful fishery?—It continued to be a successful

LONDON.

D. Russell.

16 March 1865.

fishery up to the time that the fishing was prohibited in the summer months.

60,351. Had not the fishery declined before then?—It had not declined generally. In different spots there were plenty of oysters to be found at that time. There were also plenty of people to catch them, and all the people who were engaged in the oyster fishery, if they chose to work at it, were doing well.

60,352. What occurred after the prohibition took place?—The consequence of prohibiting dredging in the summer months was that a great many fishermen had to leave off altogether.

60,353. Naturally, the supply of oysters would decrease if the oysters were not fished?—The people could not live by working in the few months which were marked out for them. They, therefore, thought that it was better to give up the oyster fishery, and to seek something else by which they could make a more profitable livelihood. Some of them went coasting. Some of them entered into the fruit trade, and in one way or another many of the best of the fishermen went away altogether.

60,354. How did the oyster bed itself continue to progress during that time?—My father was an oyster merchant for 40 years, and I was a fisherman for a part of that time. Sometimes I went to Jersey; sometimes to the French coast; sometimes to the coast of Ireland; sometimes to Falmouth, and to every place where we expected to obtain a supply of oysters.

60,355. Did anything occur upon the oyster bed itself from the fact of its not being worked, or in any other way, to affect the production of oysters in consequence of the fishermen being prohibited from dredging upon the ground in the summer months?—Yes, the ground all along the coast of England became smothered up with slob, and although the oysters continued to spat, there was nothing for the spat to settle upon, and in that way the bed became destroyed.

60,356. Are these oyster beds no longer fished at all?—No, there is nothing to be got there now.

60,357. They are not fished?—No.

60,358. Are there no oysters there at all now?—There may be a stray one or two, but nothing to make it worth while fishing.

60,359. Do you attribute that falling off in the supply of oysters to the fact that the ground was not worked in the summer months, and that, therefore, the slob had an opportunity of growing?—Yes.

60,360. The consequence then of prohibiting dredging during the summer months was that the ground became smothered up, and the oysters disappeared?—Exactly so.

60,361. Had the bed itself not began in any way to show signs of being over-fished before this took place?—The quantity of oysters obtained upon it was not as great as when the bed was first discovered. The supply decreased after the fishing had been carried on but, after being left alone in the winter time, it recovered itself. The fishermen were obliged to leave it alone in the winter time as they were unable to work it then.

60,362. Was that on account of the bad weather?—Yes.

60,363. In the spring you found plenty of oysters again?—Yes. The supply in the spring had so increased from what it was before the winter set in, that one boat was able to get 40 or 50 bushels of oysters in the course of three or four days' dredging.

60,364. Did you observe, then, that in different years the quantity of spat varied very much? For instance, was there a good spat in one year, and a bad one in another?—No doubt in some places that would be the case; but there were always plenty of oysters to be got.

60,365. Are we to take it that the whole quantity fished at that time was as great as now?—Yes, and very much greater.

60,366. Are you able to say whether there were as many boats then employed in the oyster fishery on the coast of England as there are now?—I think twice as many, and I do not think I should be far wrong, if I said five times as many.

60,367. Then do you think that the English market at the time to which you refer was supplied with a much larger quantity of oysters than it is now?—I think the market at that time was supplied with a much greater quantity of oysters than now. Of oysters of a good quality there was certainly a much larger supply, and the private grounds were stocked to a much greater extent.

60,368. Do you mean that the private grounds were stocked with fish brought from the deep sea, or do you refer to private grounds where oysters were in the habit of breeding?—They were not breeding grounds.

60,369. They were feeding grounds chiefly?—Yes. The benefit obtained by those who had the private grounds arose chiefly from the growth of the oysters.

60,370. They were laid down there when young, and left to improve?—Yes.

60,371. Were you acquainted with the oyster fishery in the Channel Islands?—Yes; I was well acquainted with it.

60,372. Are you aware whether that fishery continues to be productive or otherwise?—I think not.

60,373. Can you give us any reason which has led to its becoming less productive?—I think the cause has been the Convention between this country and France, and the steam together.

60,374. How has steam affected it?—The steamers are able now to carry out the provisions of the Convention Act more effectually than they would otherwise do. They are able now to drive the vessels away which used to work over the ground, and by constantly dredging, keep it clean.

60,375. No doubt the object both of the French and English Governments in entering into that Convention was to increase the supply of oysters by such arrangements as they considered it most advisable to make?—No doubt that was the object; but I think they took a wrong course in the measures they adopted. They did not properly understand the question, and they made a great mistake.

60,376. You believe that they were in error in the course they adopted?—I have not the slightest doubt of it.

60,377. Will you state shortly what you consider to be the erroneous principle they adopted?—The great error they committed was in prohibiting the dredging in the summer time, or even at all.

60,378. Was there not a risk that, if some measure of that kind had not been adopted, the fish might have been entirely fished out?—I do not think there was any fear of that.

60,379. Have you ever seen any oyster banks fished out in consequence of the continuous fishing of them?—No; I never knew a fishing ground destroyed by that means, except it was a private ground, where there was only a small quantity of oysters laid down. In that case, the ground might be so nearly destroyed by over-fishing as to become worth nothing. In point of fact, I have seen private grounds broken into by a lot of boats, and so much injured and destroyed, that no stock was left.

60,380. The same principle you would apply to the fisheries in the Channel Islands as to those on the south coast of England?—I consider that the beds in both cases have been destroyed entirely by the protection which has been given to them by the French and English Governments.

60,381. Have you had any experience of the oyster fisheries on any other coast?—Yes, I have had experience of the oyster fisheries on the Irish coast.

60,382. What has been the case there?—I do not think that the same result has been produced there exactly. There are still many oysters to be found there in certain places; but the ground is of a different nature there; it is not so liable to choke up as the ground in England.

60,383. Is the ground which is situated in shallow water more likely to be choked up by slob than that which is in deep water?—Yes, it is far more likely to become choked up, and in the harbours round our coast, the mud has the same effect as slob at sea.

60,384. Does that also destroy the oysters?—Yes, it destroys both the oysters and the ground too, where the ground has been protected. I know many places now where nothing but mud is to be found, but which were good oyster grounds formerly.

60,385. Mud and sea-weed have choked up and destroyed the oysters?—Yes.

60,386. Do you think if such a ground had been regularly dredged over, that that operation would have prevented the deposit of mud, and that the result would have been that the ground would have continued to be a good ground?—Yes, and I can give an instance that came immediately under my notice.

60,387. What is it?—It is the case of Langston Harbour and Chichester Harbour. Up to the time of the French Convention, it used to be the rule not to work all the summer through; but the fishermen began on the 5th of August. That was supposed to be the first day of the season. It was always the custom amongst the fishermen themselves, when there was no law to regulate the dredging for oysters, to begin on the 5th August; but they used to steal in upon the ground, probably, all through the month of July, and there would be boats working upon it during the night time, and so on. During the time the ground was worked in that way, there was a vast amount of oysters obtained there. The supply, indeed, was unaccountably large. There were so many oysters that one man with a small boat could go out and get seven or eight bushels in the course of three hours.

60,388. What is the case now?—There are none to be got there at all, nor is there any oyster ground.

60,389. Is that because it has become choked up with mud?—Yes, the oysters have been buried in mud.

60,390. Do you think that has arisen in consequence of the ground having been left unworked?—Yes.

60,391. Then what remedy would you, from your experience, suggest for the evil of which you complain?—I would clear away the law, and burn all the Acts of Parliament. We should be right enough then.

60,392. Would you leave the fishing entirely free?—Yes, and I am satisfied that, in that case, there would be plenty of oysters again.

60,393. Do you think that the oysters would return to those banks?—No, I cannot say that. They might not return to those particular banks which have been destroyed already, but other places would be found which would become worth working, and the supply, by that means, would increase.

60,394. Do you think that no legal restrictions are requisite in order to increase the supply from the oyster fisheries?—I believe that, in places like the grounds in rivers and harbours, it would be just as well to keep a close time in the summer months, say, between the latter end of May and the 1st of August. Perhaps, in part of the month of July, and certainly in August, the ground should be worked.

60,395. You would leave that, of course, to the self-interest of the people to whom the grounds belong?—It is the public grounds I am speaking of now, not the private grounds. The private grounds are in a totally different position. Upon the private grounds, as a general rule, there is no natural spat, such as there may be at the mouth of the Thames. There, there is a great deal of natural spat; but, as a rule, private grounds are only grounds where oysters are deposited for the purpose of improving and getting fat, and not of breeding. The spat that falls upon such grounds is not sufficient for any person to rely upon it, and take steps for collecting it. My father was in the trade for 40 years, and I was in it myself for many years, and I can say that we never benefited from the spat upon the private grounds, although it may have contributed to the supply of oysters upon the public grounds.

60,396. Upon the public grounds you think there should be some regulation for working the ground during August?—I believe that, in the rivers and harbours, the spat does not fix itself until August. I believe that early in August is about the time that it fixes itself, and if the ground were worked up to that time, it would then be clean for the reception of the spat. Ever since the month of August has been shut up to the fishermen there has been a scarcity of oysters, which has been gradually becoming greater ever since, and there have been no more great spats in the harbours. Formerly, the spat from the harbours mainly supplied the London markets.

60,397. Would you recommend that the month of August should be an open month?—I have no doubt that it ought to be, and the month of May also.

60,398. Are you in favour of having any close time at all?—I should not be in favour of a close time, if I had my own will. I think we should be better without any; but, if there was any at all, certainly the month of August ought to be free.

60,399. And you say that the month of May should be free?—Yes, May also.

60,400. Would it be of great advantage to deep-sea oysters that there should be no close time?—Yes; but I am speaking now of the grounds in harbours and rivers. I think that, in connexion with those grounds, there might be a restriction enforced in the summer months, but more for the purpose of driving the fishermen to sea at that time than anything else.

60,401. Have you had any experience of the oyster fisheries in the North American Provinces?—I have been in a great many places in the North American Provinces where there are oyster fisheries, but there is no dredging there; they only pick them and rake them up.

60,402. Has your experience in those provinces afforded you any further knowledge of the question that you desire to communicate to us?—There is one thing, namely, that the frost in the American waters does not kill them, although it does here.

60,403. How do you account for that?—Because the oyster ground is sealed up with ice. When the ice once becomes fixed there, it does not remove any more for some considerable time.

60,404. The oysters are covered in with ice?—Yes.

60,405. They are not so much exposed to the air?—No, and the water is not so cold at the bottom as it is in England. I have known them freeze in five fathoms of water in England. I do not agree in what has been stated as to the amount of temperature that would kill an oyster. Out of a thousand bushels there may be such a thing as 10 die.

60,406. (*Professor Huxley.*) Is there much oyster-fishing carried on in the winter time?—No; in the winter time the fishermen cannot work profitably.

60,407. Do you think that in the summer time there is likely to be enough bad weather to prevent over-fishing?—Yes.

60,408. Are you acquainted with the operation of the steam dredge?—No; I never saw one.

60,409. It is used on some parts of our coast?—I never saw it. My opinion is, that if the harbours in America were dredged, there are plenty of oysters to be found at the bottom.

60,410. Do you think it may be from the absence of sudden changes that the oysters are not so much injured in cold weather in America as here? The winter there, you are aware, sets in more steadily and regularly than it does here?—I do not think that has much effect. I have always found in England that if a hard frost comes on, whether it comes on gradually or suddenly the oysters will die.

60,411. In what depth of water?—They will die in five fathoms. They are far more likely to die in less than five fathoms, and more still when they are dry.

60,412. You say that you would leave the fishing

LONDON.

D. Russell.

16 March 1865.

open?—Yes, I would have it absolutely free. I believe it would be better then for everybody, and there would be plenty of oysters.

60,413. As soon as the oysters became scarce on a bed, do you think the people engaged in dredging would find it too costly to work there, and that they would go somewhere else?—Yes, but I think that if there is to be any restriction at all, it should refer only to oysters in rivers and harbours. It might do some good in the harbours, to prevent the boats from working when the oysters are not in season.

60,414. In that case, the boats would be obliged to go out to sea?—They would not, if they could get a bit of a crust in the harbour, go to sea to get beefsteaks. I, therefore, think it would be good to shut up the dredging in harbours for a few months in the summer time when the boats can go to sea, but I would have the restriction apply merely to the in-shore grounds, such as those inside the Isle of Wight.

60,415. (*Mr. Lefevre.*) When did you observe the falling off commence?—Directly the law was passed.

60,416. That was in 1843?—I think it was. In 1840 and 1841, there were plenty of oysters.

60,417. The law was not carried out strictly for some time after it passed?—No, I think not.

60,418. Were your smacks able to evade the cruisers?—They used to steal out and leave their dredges out in the sea with buoys attached to them, so that they knew where to find them again. They would then pick them up, and the Coastguard did not take any notice of the oysters they brought in, provided they had no dredge on board.

60,419. You have been on the French coast for oysters?—Yes, I have been to Cancale, Granville, and other places, and I know how the oyster fisheries are carried on there. The quantity obtained there was immense at one time. A vessel might go out at night and catch 250 bushels before morning.

60,420. Has the supply fallen off of late years?—Yes, it is all mud now.

60,421. The oyster smacks have now to go out into deeper water for their fish?—They have to go now into the Channel, and there are only a few of the best boats that can do that.

60,422. Twenty years ago were those beds in the deep water not worked at all?—I think they were discovered about 22 years ago.

60,423. Are the vessels that are employed now in oyster dredging larger than they were?—Yes.

60,424. Are they better adapted for the work than they were?—Yes.

60,425. What number of smacks were there 20 years ago?—I have seen as many as 300 in one fleet, at Jersey.

60,426. Were they mostly Jersey men?—No, there were very few Jersey men amongst them.

60,427. Then were they mostly English boats?—Yes, they used at that time to go from every part of England.

60,428-31. We were told at Shoreham that there are now 300 large smacks bringing in oysters to Shoreham and Newhaven?—There was not one when I first went to Shoreham.

60,432. When you talk of a falling off in the number of fishermen and smacks, one would like to know what the number was in former years, and what the number is now?—There are not 300 boats, I am satisfied, belonging to Shoreham and Newhaven that go dredging. I think, if you make inquiries, you will find that is a mistake. There may be about 300 altogether fishing in the Channel, but they principally go from Colchester, and Whitstable, and other places.

60,433. Was there any considerable quantity of small oysters brought in by the smacks fishing in the deep Channel?—Yes.

60,434. Were they smaller than $2\frac{1}{2}$ inches in diameter?—They would be about $2\frac{1}{2}$ inches across.

60,435. Then has that trade been done away with altogether?—Yes, as near as possible.

60,436. Was it for the laying down of those oysters that the beds off Langston Harbour were adapted?—Yes.

60,437. Have those beds been discontinued altogether now?—Yes, because they could not get a supply of oysters.

60,438. Was that a very profitable business while it was carried on?—It is only carried on in a very small way now, as compared to what it was then.

60,439. Was it a profitable business to take small oysters and lay them down, in order that they might grow into large ones?—Yes, it was profitable when well managed, but there have been a great many people who have become bankrupt by it.

60,440. Was the great bulk of the oysters taken on the ground you speak of a small class of oysters?—If we could avoid it we never had any larger than that (*showing an oyster*).

60,441. That is about an inch and a half across?—Yes, and if we get them smaller, so much the better.

60,442. Did you find any difficulty in removing oysters of that size to the beds?—No; they would keep for three or four days.

60,443. Even in the summer time?—Yes. In the winter time we had them in once a week and in the summer time twice.

60,444. How long did you keep them on the beds?—They were allowed to remain on the beds for two years before they were sent to the market.

60,445. Then is the trade now on the south coast solely confined to keeping the oysters on beds so long only as to keep up a regular supply to the market?—There are only large oysters to be got now, and it is simply a deposit for the market that they can get now.

60,446. What was the difference in the price of oysters grown on those beds and the large oysters as they came out of the Channel?—There was a great difference.

60,447. What was the difference?—We used to get coarse Channel oysters from Jersey, and they would fetch about half-a-crown a bushel.

60,448. What would be the price of the others?—They would bring in as high as 4*s.* a bushel—between 3*s.* 6*d.* and 4*s.* That is the price we should pay for them at Jersey.

60,449. What price would they fetch after they had been laid down for two years?—5*s.* 6*d.* and 6*s.* a bushel. But a bushel then would not contain two-thirds as many oysters.

60,450-1. Then the price would be about double?—Yes, the oysters would increase fully one-third, so that the increase in the price sometimes amounted to one-half or two-fifths simply by growth alone.

60,452. Used you to find in the summer season, when dredging took place on the grounds, and the oysters were brought in in a spawning state, that they fetched any price?—They always could be sold.

60,453. Was there any demand for them?—Yes, always. They were sold at fairs and to poor people generally. Of course the better class of people would not eat them in the summer months, but in the worst spawning time you would not find more than six or twelve out of a hundred in that state.

60,454. The others would be good wholesome oysters?—Yes.

60,455. Was the best part of the take of the small oysters for the purpose of laying down?—Yes, they were always got in the summer and laid down.

60,456. In fact, the operation in the Channel at that time was very much what the operation in the estuary of the Thames is now?—Yes, only in the winter months the oysters were practically protected in the Channel, because the boats were not able to work there on account of the weather. But they had then the harbours along the coast and inside the Isle of Wight, which were comparatively sheltered to fall back upon.

60,457. In point of fact, the process in the Channel was very much what it is now in the estuary of the

Thames? The public beds were dredged regularly, and the supply was taken from them for the private beds?—Yes. There was always more or less scarcity of oysters at the mouth of the Thames. They might get a few or none, whereas in the Channel it was always different.

60,458. Were any of them taken from the Channel and laid down on private beds?—I never knew small oysters to be taken in the Channel. They were generally got from the beds along the shore at Shoreham, Bognor, Littlehampton, and the oyster beds about the Nab Light. Before the Shoreham ground was discovered, we used to get a great number there.

60,459. What distance from the shore?—They were got in about 7 or 8 fathoms of water, about two or three miles from the shore.

60,460. How far is the Shoreham ground from the shore?—From four to seven miles from the shore.

60,461. Have all the grounds in-shore decreased in their supply?—Yes; as nearly as possible, they have been altogether destroyed. There may be a place or two where a few oysters can be found, but, as near as possible, the beds in-shore have entirely failed. No one could get a living from them now.

60,462. (*Professor Huxley.*) You stated just now, that, at any given time of the year, the number of oysters actually spawning out of a hundred would not be found to be more than 12 or 14?—No, never more than that.

60,463. Is that the result of your own observation?—Yes; I have observed that, year after year.

60,464. There were not more than a dozen or so, even in the height of the spawning time?—No; and I find that the coarser the oysters are,—for instance, the Channel oysters and those from Jersey,—the more freely they spawn than those obtained along the shore.

60,465. Then, in the fullest spawning time, there would be 80 per cent. of the oysters fit to eat?—Yes, and they would be very bad when there were only as few as that.

60,466. That is a very important statement indeed, because it goes to the whole bottom of the question of the establishment of a close time and the prohibition of dredging?—My opinion is, that a close time and the prohibition of dredging during the summer months are a mistake; there is nothing like free trade.

60,467. You say the circumstance you have mentioned was a matter of notoriety?—Yes; it was known to all who had anything to do with the oyster trade. But legislation altogether has had a bad effect. The provision requiring us to mark our sails was very much objected to. We were determined that we never would be marked up as the Frenchmen were, and I can assure you that we were as particular in regard to our vessels and our sails as a gentleman is of his yacht.

60,468. This question of the per-centage of oysters actually in spawn at the spawning time is very important; and I should be glad to know if it is a matter of notoriety that, at no time of the year, you would get more than 12 or 14 out of a hundred that were sick?—That is a well known fact.

60,469. (*To Mr. Buckland.*) You stated, I think, that you had made an investigation of that kind?—Yes, to some extent.

60,470. What was the result of your observation?—I can quite understand what Mr. Russell says, but I presume that he would not know that the oysters he found fit for food had not spawned.

60,471. Do you agree with him as to the matter of fact? Did you find, from your own observation, that, taking a hundred oysters at any time of the year, you would not find more than 12, 14, or 20 actually spawning?—I think that is very possible.

60,472. Was that the result of your own observation?—Yes, it was; but I found also that there were other oysters which had spawned, and others that would spawn.

60,473. That is a perfectly distinct matter?—Yes.

60,474. (*Mr. Caird, to Mr. Russell.*) With regard to the 12 or 20 oysters which would be in a bad condition, could anything be done with them?—No, nothing at all.

60,475. Then they would be lost?—Yes; they would be wasted if they came to the market.

60,476. Was there any means by which you were enabled to discover whether oysters were actually spawning before you sent them to the market?—It might be detected beforehand,—before they were actually sold; but if they once got to the market, there would be no chance of their going back again.

60,477. Would they present such an appearance as would enable an oyster fisherman to distinguish them, and not take them to the market at all?—No; he would not be able to discover that fact unless he had kept them for a day or two.

60,478. (*Professor Huxley.*) They would then gape, and show the spat?—Yes; but we were obliged to carry to market the sick and the well together. I was in the oyster trade myself, from 1851 to 1854, at Liverpool. We had oyster beds in the Menai Straits, and we did a very large business there, until our beds were broken in upon by the Welshmen and destroyed. We used to take, on the average, about 200*l.* a week, both summer and winter, and sometimes we took 100*l.* a day.

60,479. (*Mr. Lefevre.*) How was it that your oyster beds were broken in upon?—We laid down 3,000*l.* or 4,000*l.* worth in the deep water, and they broke in upon them and stole them, and took them all away.

60,480. (*Mr. Caird.*) Were you in the habit of fishing those oysters every day in the year?—Not in the Menai Straits. We laid them down there all the summer months, and we did not touch them until they were fit to be taken to the market. We used occasionally to overhaul them, in order to see if the ground were clean or not.

60,481. Were those oysters brought from the Arklow Coast?—Yes.

60,482. Were they small oysters, that were laid down in order that they might grow into big ones, or were they simply laid down until they could be sent to the market?—They were generally small oysters. Sometimes we bought as many as 400 or 500 bushels a week, and we were able to dispose of that quantity throughout the year almost. We culled the oysters, however, taking the large from the small, and all the small ones we put back again into the deep water. Four or five bushels of small oysters were thrown into the deep water in a day, culled from those which were fit for the market, and if we could get a cargo of small oysters we threw them in also, but we never threw the large ones in.

60,483. Was that a private bed?—Yes.

60,484. Was there any difficulty then in enforcing the law for the protection of private property?—Yes, we had a great deal of difficulty in the matter; and we took every step to make ourselves secure. In the first place, we had a lease from the Bishop of Bangor, who claimed the ground that was dry at the ebb of the tide; his rights were supposed to extend to low-water mark, but he claimed beyond that.

60,485. But could he not enforce his claim?—He was not able to establish his claim beyond low-water mark. We also took a lease from the Woods and Forests of the ground in deep water; and from Sir Richard Bulkeley of the ground on the Anglesea side. Under these circumstances, we considered ourselves perfectly safe, as we had leases embracing the Bangor side, the Beaumaris side, and the water in the middle of the strait; nevertheless, the beds were broken in upon, and the oysters taken away.

60,486. Did you not prosecute the offenders?—Yes, we proceeded against several persons, and one or two of them were sentenced to six months imprisonment, but after that they came in upon us by hundreds.

60,487. Was it the ground they had been in the

LONDON.

D. Russell.

16 March 1865.

habit of fishing upon before?—No, it was all clean ground until we laid the oysters down there.

60,488. Then they were oysters which you had brought there, and which were your own private property?—Yes.

60,489. (*Professor Huxley.*) Would it have cost you too much to have enforced the law?—It cost us 3,000*l.* as it was. We lost 3,000*l.* worth of stock, and we thought it was time to get out of it.

60,490. (*Mr. Lefevre.*) Then, are the Beaumaris beds confined to beds now above the low-water level?—Since then, I believe, there has been a Company started upon our rights, and shares have been allotted, but we never looked after the beds since. I believe they have been doing little at them, and that they have been paying so much a bushel for what they got.

60,491. Is not the principal market for the Beaumaris oysters during the summer months?—The oysters are sold in the country towns round about, but they do not care where the oysters come from.

60,492-3. Are the Beaumaris oysters more for the supply of the market in the summer than in the winter?—Yes.

60,494. Your trade was to buy oysters when they were in season, and lay them down for supplying the market in the close time?—Yes.

60,495. Did not that operate very much as if you had been allowed to take oysters during the close season?—It was very much the same thing, because they were marketed during the close season. But the same thing is done now; the Channel oysters come to London all the year round.

60,496. They are laid down on beds at Shoreham and Colchester to supply the London market during the summer months?—Yes; I believe that my father was the first who ever laid down an oyster at Shoreham, and my brother was the person who discovered the oysters in the Channel.

60,497. The operation now is to work the oysters in the open season, to lay them down in beds at Shoreham and Colchester, and to supply the market during the close season?—Yes.

60,498. Then the effect is much the same as if the oysters were allowed to be taken all the year round?—Yes.

60,499. (*Professor Huxley.*) Then, in that case, it comes practically to the same thing as if you took the oysters from the deep sea during the close time?—Yes, it comes to the same thing.

60,500. The same quantity of oysters are taken from the sea, and the same quantity are prevented from breeding?—Yes; some of the stocks may run out before the season is entirely over, and then there would not be as many sold; but there used to be enough got when I was in the trade.

60,501. It would be practicable to provide a sufficient supply of oysters during the whole of the close time?—Yes, we always endeavoured to do that.

60,502. If any person attempted to provide fully for the close time by sending out steam vessels and dredges, would he not be able to get as many as he pleased from the deep-sea fisheries?—Yes.

60,503. There would be nothing to stop him?—No.

60,504. Then, in that case, the result in the long run would be the same?—Yes.

60,505. And it would be just the same as far as the prevention of breeding is concerned?—Yes.

60,506. (*Mr. Lefevre.*) You spoke of the operation of the Act on the fishermen themselves, by stopping their fishing during a portion of the year?—Yes, of course, they want to be able to obtain a living all the year round, and not to lay up their vessels. When the law came into force it was necessary to lay up the vessels, because the fishing was not allowed, and the result was that many persons were obliged to sell and get rid of their boats. It was not worth their while to keep them laying up all through the summer months.

60,507. What do the larger smacks which are employed from Shoreham do in the close season?—Some of them go coasting, but they are larger boats than those of which I have been speaking, and they can make more use of them than the fishermen were able to do in former times. They are engaged in the close season in carrying stone and different things.

60,508. Then in your opinion the operation of the close time is to prevent the economical fishing of oysters in one instance, and to prevent the profitable employment of the boats during the close season?—Yes, and the people about Essex have other chances of earning a livelihood, when they are not engaged in oyster-fishing, for instance, they can look out for salvage and wrecks, and so on. They go sprat-catching in the winter, and they can go to different kinds of work, so that they can employ their time and manage to get on; but on the south coast the fishermen have nothing but the oyster-fishing to depend upon.

60,509. How many smacks had you of your own, employed in the Channel?—Amongst our family we had about six.

60,510. Was it in consequence of your inability to employ your capital during the close season that you were obliged to give the oyster-fishing up?—Yes. We found that it would not pay to catch them.

60,511. Other people found the same result?—Yes, and the consequence has been that almost all of the boats which were employed on the south coast have been given up.

60,512. Were they not adapted for any other kind of fishing?—No, they were fit for nothing else except the oyster-fishing.

60,513. Then have the beds been discontinued?—They have to a great extent; there are still some, but they are merely deposit beds, upon which the stock is placed in the season, in order that it may be sold in the summer. The beds are used, in point of fact, for enabling the oysters to grow and improve until they become marketable stuff. At one time, we never used to think about selling oysters in the summer at all.

60,514. You simply laid down everything you took?—We used to lay down all the small oysters. We would only buy small oysters then. We did not require anything large. It could not be too small for us. There were always other merchants who would take the large oysters, but we only took the small. We cultivated them, and we were always enabled to obtain one-third clear profit, besides the difference in price realized from the improved quality of the oysters.

60,515. Where are your beds?—In Langston Harbour.

60,516. Do you carry them on now?—My brother does.

60,517. Were a considerable quantity of oysters sent to the Thames?—Yes, the greater part of them,—nearly all.

60,518. There was nothing to prevent the small oysters from being removed in safety?—No, but we generally kept them for two years on the beds.

60,519. You found it more profitable to do so?—Yes.

60,520. But did the journey to the mouth of the Thames make no difference?—Some of them would die on the passage. They could not be brought to the mouth of the Thames from the Isle of Wight in the summer months.

60,521. Was that too long a journey?—Yes, but they could be carried down to the Isle of Wight from Shoreham, Langston, and other places, because the distance is only short. The boats used to deliver what they had got on the Wednesday, and then go out for the remainder of the week. On the Saturday, however, they would only go to the beds that were near at hand, and for years the new ground was only worked on a Saturday for that reason. It was worked by the boats, which during the rest of the week had been dredging for oysters further away.

60,522. What is the extent of the ground which

you speak of, and which has gone out of working?—I could not give you the acreage, but the extent is very considerable.

60,523. How many miles long, should you say?—The Shoreham ground was 14 or 15 miles from one end to the other.

60,524. And what was the breadth?—The breadth of the ground varied from one mile to four.

60,525. Might not the silting up of the beds with mud be due to natural causes, and not to the want of dredging?—It is owing to natural causes, no doubt. It is the tide that does it.

60,526. Then might it not have accumulated under any circumstances?—Not if the ground had been properly worked. If it had been worked, the tide would have carried it away, without allowing it to accumulate. For instance, on the ground in Langston Harbour and Chichester Harbour, there are now miles of mud that the tide only goes over at high water. In a gale of wind that mud is stirred up, and the water becomes thick, and the mud settles. If there was nothing to disturb it, it would remain, and gradually form a coating over the bottom; but if it is disturbed, then the tide carries it away, and the ground becomes clean again.

60,527-31. The dredging in the winter months is not sufficient to carry it away?—No, because it settles more in the summer than the winter.

60,532. (*Mr. Caird.*) I think you said you never found any small oysters in the deep sea?—There might be some, but we did not generally get them from the deep sea.

60,533. Have you never, in dredging in the deep sea, brought up small oysters?—A few, but not many.

60,534. (*Mr. Lefevre.*) Do the fishermen use too large a ring?—That might have something to do with it.

60,535. (*Mr. Caird.*) Is it possible that there might be in the Channel a large quantity of small oysters, that might be with profit dredged up and laid down upon feeding grounds?—That is very possible, as all the oysters must have been small before they became large.

60,536. But small oysters have never been obtained, as a general rule, whilst you have been fishing in the deep sea?—Not in deep water.

60,537. Not in the Channel?—No.

60,538. But most likely they may be there?—Possibly they may be. There are not any where they were. It is not general for the fishermen to work where they do not know the oysters are. They generally go where they do know they are. Of course, if they do not find them, then they try some other place, but it is only by mere accident that a new spot is found out.

60,539. Is it not usually the case that you find large and small oysters together?—Not often, but sometimes it is the case.

60,540. What months of the year are most favourable for the growth of slob at the bottom of the sea?—It depends altogether on the season. At the latter end of April and the beginning of May it begins to show itself.

60,541. Just as the grass grows on the land?—Yes, and the growth of barnacles is just the same; they spat at that time by millions.

60,542. If permission were given to work the ground in May, would the slob you speak of be destroyed to a great extent?—Yes, that would do a great deal of good; in the latter part of the summer it turns almost black, and becomes converted into a kind of mud in July and August. There have not been a great quantity of oysters caught in July and August on the public grounds at the mouth of the Thames, between the Foreland and Orfordness.

60,543. Within that limit?—Yes.

60,544. Within your experience, have any new oyster beds been found quite outside in the deep water, outside that limit?—I do not know of any; some have been said to have been found off Dover.

60,545. But towards the north, in the North Sea, to the Dudgeon?—I am not acquainted with any other oyster beds in the North Sea.

60,546. You do not know of any?—No.

60,547. Have you any experience of the oyster fisheries along the coast of Norway?—No, but I know there are oyster fisheries in Denmark.

60,548. Where?—There is an oyster fishery in the Cattegat.

60,549. In the Cattegat?—Yes.

60,550. That is not outside?—No.

60,551. Does that oyster fishery continue to yield well?—I think not.

60,552. (*Mr. Lefevre.*) What was the size of your boats?—I have had them of different sizes, running from 25 to 60 tons.

60,553. How many men are there in each?—There are six men in each boat.

60,554. Was your head-quarters at Langston Harbour?—Yes.

60,555. Is it within your knowledge that the men who were formerly engaged in the oyster fishery have gone off to other trades?—I do not think you would find six of them engaged in oyster-fishing now.

60,556. Not in dredging for oysters?—No. Not at Langston, Chichester, or Portsmouth.

60,557. Then the trade has been literally done away with?—I do not believe there is one of them left.

60,558. What are the boats that dredge in the Channel?—The dredging in the Channel is chiefly carried on by the Essex people.

60,559. And by the Shoreham people?—The boats go to Shoreham, but they do not belong to there. They harbour there because it is handy.

60,560. Then are they merely Essex people who carry on the dredging?—Yes, and they only harbour at Shoreham. As to Newhaven, I do not believe there is a boat belonging to the place. If there is, it is a stranger.

The witness withdrew.

WILLIAM J. FFENNELL, Esq., called and examined.

W. J. Ffennell, Esq.

60,561. (*Mr. Caird.*) You are a salmon fishery Commissioner?—Yes.

60,562. And you were previously a sea fishery Commissioner in Ireland?—Yes, for many years.

60,563. You have had a long experience of the sea fisheries in Ireland?—Yes, and I have paid particular attention to the oyster fisheries of Ireland.

60,564. Can you, from the knowledge you have obtained as to the Irish oyster fisheries, give us any information regarding the present supply of oysters compared with what it was some 10 or 15 years ago?—Yes, and I may attribute to steam, as the last witness did, the cause of the deficiency in the supply of oysters, but not for the same reason that he assigns. I do not think that it has anything to do with that, but the introduction of steam, by distributing the oysters through all the arteries of the United Kingdom, has occasioned an immensely increased demand.

60,565. By steam do you mean the introduction of railways?—Yes, both steam-boats and railways.

60,566. You mean the increased facilities of communication?—Yes, the means of transit have become extended and facilitated; that has induced a much larger amount of capital to be invested in the trade, and the appliances for carrying it on are improved; more men have gone into it, and there has been a great amount of over-capture of oysters, which, in my mind, has been the cause of all the evil.

60,567. Do you think that the grounds have been over-fished?—Yes, the over-fishing, which has oc-

16 March 1865.

curred in every place, has in my opinion been the cause of the decrease.

60,568. Can you state to us the various fishing grounds that exist on the coast of Ireland?—Yes, I will begin with Lough Foyle. The fishery there some 20 years ago was most prolific in oysters. It belongs to the Irish Society, that great Corporation which is here in London. They took no care of it, however, and did not restrict any one from going on the beds. 20 years ago, or say 25 years ago, there were a vast number of oysters there for a while, but when steam was introduced the demand for oysters became very great, and the whole of the country set to to fish the ground, and they dredged it without any limit. There were no laws then to restrain them. It can be proved by documentary evidence, that in those days in Derry there was more paid for the freight of oysters in one week,—ten times over,—than is paid for the whole oyster produce of Loch Foyle now in the course of a year. I look at that as a very strong case. The people were allowed to go to the fishery at all times and to dredge as they liked, and for a while there was an enormous produce. So great was it, that, for a short time, the freight, as I have already said, amounted in a week to more than the whole amount taken in a year now.

60,569. When were restrictive laws applied?—The Act which imposed the first restriction was passed in 1842. A year or two elapsed before it was brought fairly into operation, but in 1843 or 1844 it was carried into effect, and since that time, I should say, that it has been rigorously carried out. In Ireland we have the Coastguard to look after these matters and I believe that many of the officers are very attentive to them. There is another very strong case which I may give, in reference to the Carlingford beds, where the oysters were abundant and of very fine quality.

60,570. We will turn to the Carlingford beds presently. Are we to understand that in 1842 the oyster fishery rapidly fell off in Lough Foyle?—It had fallen off exceedingly at the time the Act passed.

60,571. What has been the consequence of the passing of the Act; has the fishery ever recovered itself?—Not altogether in Lough Foyle. In point of fact, it was dredged out before the Act passed.

60,572. What is the next fishery of any importance?—The next was the Carlingford fishery.

60,573. Was there no oyster fishery in Lough Swilly?—Yes, there are oysters there.

60,574. How was it in that case?—The results were very similar to those in Lough Foyle. It was a very prolific place for oysters naturally, and there are a good many oysters produced there still, and they are sent over to this country by steamers from Derry. Those beds have been improved greatly since the passing of the Act, although they have recovered from the over-dredging to which they were subjected prior to the passing of this Act.

60,575. The next place will be Belfast Lough?—There is a large description of oyster found there. There are a few got outside Belfast Lough, but they are very inconsiderable. There never was a large oyster fishery there in my time.

60,576. Then going south, what is the next fishery?—Going south, I come to Carlingford Lough, which is the next public oyster fishery.

60,577. Is there nothing in Strangford Lough?—There are not many there, but there was a large and abundant bed at Carlingford. There the oysters were of a very superior quality. When the supply became short here, down the coast of Kent, one of the first places the public went to for oysters was Carlingford. They employed the people there before there was any restriction imposed by the law, and in the course of two or three years Carlingford Lough was dredged out, the oysters being carried over. Within the last eight or ten years there has been some improvement, but the fishery altogether has been immensely deteriorated, and has never possessed a large quantity since. So much was that the case, that people there, for their own local demand, have for years been getting a supply of oysters from the Arklow coast, the banks there having never become entirely exhausted. The oysters thus obtained were laid down at Carlingford in order to feed. Two or three years before I left Ireland, which was in 1840, the dredgermen of Carlingford Lough sought for aid from us to restrict the fishing of the beds. They are a provident, sensible set of people there, and they entered into a convention amongst themselves to shorten the open season still more than we have done, until we could perfect a law to make it so. The people there had experienced the evils resulting from the over-working and the over-dredging of the oysters, and they were, therefore, anxious to keep that down, and sensibly entered into a convention until we ratified it for them, and I believe that the oysters have since rallied.

60,578. Where is the next important oyster fishery?—The next important beds are on the Wexford and Wicklow coast. I never separate those beds because they really join. They are very extensive public beds, and produce great quantities of oysters. The oysters themselves are naturally of a bad quality, and they had partly fallen off. There were very great complaints as to the number of fishermen thrown out of employment at the time when the Act of 1842 passed. The restrictions imposed by that Act, in the course of a few years, caused a considerable increase in the oysters, but as they were of a very bad quality, if consumed when they were taken from the bed, they memorialized us to allow them to dredge in the month of May, for the purpose of enabling them to supply the Englishmen who went over there to look for them in consequence of their own supply having fallen short. After a careful inquiry, we thought fit to comply with their wishes, and, after that was done, I have known as much as 12,000*l.* paid to the Arklow fishermen in the month of May by Englishmen.

60,579. You extended the open time by a month, namely, the month of May?—Yes.

60,580. In this special instance?—Yes, under the powers we have under the Act of Parliament. I have gone down to Arklow frequently to settle disputes between the oyster fishermen and the Englishmen, who send over, beforehand, some weeks' notice of the quantity of oysters they require, in order that the fishermen may collect them. The oysters collected by the fishermen are brought into the pool and deposited, until they gather a sufficient number to freight the vessels that come over. The disputes arose in consequence of the Arklow men trying to make the English take all the large and the small. The Englishmen only wished to have the small ones. I went down several times to settle disputes of that nature.

60,581. They caught both large and small?—Yes; but the Englishmen refused to take the large ones.

60,582. Was it chiefly a fishery of small oysters in the month of May?—Yes, I believe it was.

60,583. What was the effect of extending the open fishery by a month? Had it the effect of reducing the quantity of oysters or otherwise?—It fluctuated to a certain extent. It lessened the supply sometimes, but it depended, in a great measure, upon the number of persons who came from England requiring oysters. There were also the Bangor men, to whom the last witness has referred. Sometimes the draw upon the beds was too large, and occasioned them to fall off again, but, on the whole, the Arklow beds well sustained themselves. During the last two or three years, I have learned, and, I have no doubt, it is correct, that several French vessels have been over there, which have taken a large supply. I was speaking, some time ago, to a Wexford man who has paid some attention to the matter, and he told me that he was afraid the draw was again becoming too heavy.

60,584. Then it would appear that the fact of extending the fishing season for a month lessened the

supply of oysters on the whole ?—Not very materially, I should say. But then there is one thing to be considered about that, viz., that part of the coast where the oysters are is a very open and wild coast. There is much less dredging there in the winter, because the oysters are very valueless for eating. They are of a remarkably bad quality there, and they do not seek them much in the winter.

60,585. Would not that fact rather strengthen the idea that, inasmuch as previously, during the winter, they were not much fished, the fishery being increased by an additional month, viz., the month of May, would result in a very large additional quantity oysters being taken off the ground during that additional month, it being a good month for fishing there ?—A great many oysters were taken off in that good month, no doubt.

60,586. The fact of allowing the fishermen to fish in the month of May led to a greater quantity of oysters being taken than if they had been fished in December and January, for instance ?—Yes.

60,587. The extension for a month in May led to more being taken than would be taken in the winter months ?—Yes. On some of the banks there is a very coarse description of oysters, for which there has been a great commerce from time to time between Wexford and Liverpool. Those are eaten by the men employed in the dockyards. They would not sell here at all. They are immense, flavourless, bad oysters, very large and coarse, but they meet with a ready market in Liverpool.

60,588. Have you any knowledge of the kind of ground on which the oysters are obtained on that coast ? Is it a ground that would be productive of slob or of a grassy growth at the bottom of the sea ?—No, there is not much slob there, and not much mud. I attribute the abundance of oysters to that fact. There are pools or eddies there formed by the tide, but there is no sweeping current to take away the spat. Wherever I have paid attention to the oyster beds, I have found that there is no such thing as a natural prolific oyster bed where there is what is called a race of tide over it. Where there are eddies or currents it allows the spat to fall, but where there is a great race of tide it carries it away.

60,589. Then, leaving that ground, the next oyster ground would be in Waterford Harbour ?—Waterford Harbour contains a very large and well-flavoured oyster, of a very good size, yet it fell off to nothing almost, in consequence of over-dredging, and for some years, perhaps, three dredges would not go out for a whole year, and those would catch only a small quantity. Within the last week, I met a gentleman from Waterford, who is very active with regard to the sea fishery, and he told me that he had equipped, the year before last, two good dredgers, and that he is doing very well in the harbour off Waterford, so that there has, evidently, been a rally there, but I think it has arisen from the absence of dredging. I believe that the fishery there had become so valueless that the people did not find it pay to go after it; but, after two years' rest, it has rallied, and the gentleman to whom I refer is now doing well with his two dredgers.

60,590. The next place is Cork Harbour ?—Yes. In Cork Harbour the oysters are very fine, and they have been sustained because they are upon private ground. Mr. Smith Barry has beds there, and he looks very carefully after them. I believe that onslaughts have been attempted to be made upon them, but we have prohibited dredging by night, in order to protect them. They had somewhat fallen off before then, but they have since rallied again. They had been plundered to such an extent that they were nearly exhausted, but they are now recovering themselves.

60,591. Where is the next fishery ?—In Kinsale harbour.

60,592. How are the oysters there ?—The fishery has greatly fallen off there in consequence of over-dredging.

60,593. Do you go on from there to Dingle Bay ?—There was nothing, in my time, of any importance between those places, except on the Kerry and Kenmare Bay beds. There is a gentleman there of the name of Bland, who has private beds; he has not over-dredged them, and the result has been that they have proved very valuable private beds. The public beds are not at all in the same position; by some means or other they have been dredged out. But Bland's Bank, as it is called, is still a valuable bank, and it has been so for some time, but it is carefully preserved by him. There are some beds outside the mouth of the Shannon, and in the Shannon there are grounds which, no doubt, might be made very valuable grounds if converted into private property, but they have been dredged out for the market of Limerick, so that the oysters have not been allowed to get up as far as there.

60,594. Has that been the result of constant dredging ?—Yes, it has arisen from over-dredging, just the same as in Lough Foyle.

60,595. In the shallow water ?—It is shallow water; at low water there are not more than two or three feet. There are parts of the ground upon which there are seven or eight feet of water. The next important beds are the oyster beds on the Clare side of the Bay of Galway. There are many exceedingly valuable banks there, but they are entirely feeding grounds. The oysters do not fructify, except to a slight extent. The oysters are brought from the opposite side of the bay, and they are planted on the Clare side, and become the sole, or rather the principal, supply to the Dublin market.

60,596. It is a very extensive oyster fishery, is it not ?—It is not so very extensive. The principal person engaged there in the trade to Dublin has made money, and, I believe, is still doing so; but the whole extent of his oyster ground is but four acres. They are, however, merely laid down there; they never breed there.

60,597. It is simply a feeding ground ?—Yes.

60,598. Is there a breeding ground on the opposite side ?—No.

60,599. Then where are they brought from ?—From the Connemara coast, from Rossmuck and Kilkerran; that affords the principal supply, because it is the nearest, and when they get short there, they get large supplies from Clew Bay.

60,600. Do they bring in small oysters, and lay them down in order that they may grow ?—They are not very small.

60,601. Proceeding northwards, where do you come to next ?—To Clew Bay, Achil Sound, and Blacksod Bay. There are very large and very productive natural beds in all that region, and they are in the same position. The time has been when there was such a demand from other places, that they became worked out, to a great extent, so that it would not pay for men to attend to the fishery. The result has been, that very few have gone there, and in the course of two or three years the beds have rallied again, and there has been a large supply. Under a system of licences established in Ireland, there have been some private beds made there, and licences have been granted to various persons to plant and cultivate oysters. I believe that those beds have thriven very well. I was conversing with a Kent man some time ago, who took one of these beds from a Mrs. Garvey. He told me that last summer he brought successfully, without any loss, two cargoes from Clew Bay, and planted them on the Kent coast. He said that the people laughed at him when he was going there, and told him that he had better take some salt to preserve them, but, nevertheless, he succeeded, and he sent me up some of the oysters last year, and they were most excellent. He got them over in the spring and the summer, and they were capital oysters in the winter.

60,602–3. Did they become good by being planted on the coast ?—Yes.

60,604. Do you think that the oyster beds in

LONDON.

W. J. Ffennell, Esq.

6 March 1865.

Clew Bay are likely to afford a supply for the Kentish coast and the London market?—I believe that this is the first time that any one has tried to bring them so far. Mr. Gann told me that he sent one lot to the nearest part of the railway on the coast, which, I believe, is Castlebar, and that the others he sent by boat. Those which he sent by railway came quite safe, but he told me that it was really more expensive than sending them by vessel.

60,605. (*Mr. Lefevre.*) What sized oysters were they?—They were not a very small oyster.

60,606. They were not below two and a half inches across?—No. A few years ago there was a man engaged in making up oysters in tin cases in that locality, and he obtained oysters as small as he could. Attention was called to the fearful destruction of oyster spat, by the fishermen themselves, in order to obtain small oysters. I read them a lecture myself, and I got the Catholic priest to assist me. He told them how injurious it was to destroy their own means of livelihood. It appeared that they had brought in millions of oysters, not much larger than my nail, which they had sold to a person who was engaged in curing them. They took away everything they got up in the dredge,—culch, and the spat of oysters, and everything. They brought everything to the shore, and shovelled it out of the boats; they then picked out what they wanted, and left the rest to perish. So negligent were they of their own interest, that that practice was allowed to prevail for some years.

60,607. Were those small oysters of no use for laying down?—No.

60,608. Were there no beds where they could have been laid down?—There were no beds there.

60,609. Then they were valueless?—Yes. Where that was done was in the Island of Achil, where the beds naturally are exceedingly prolific.

60,610. (*Mr. Caird.*) Have you now exhausted your description of the oyster beds of Ireland?—Yes; but of course there are a multitude of small beds which supply a small local demand, but it would be too tedious to go through them. For instance, there is a place in Donegal Bay, at Brooklus, where very nice oysters are obtained by chiselling them off the rocks. That is also done in Kenmare Bay. They have grown up to a good size, fast upon the rocks. But that is not a very large or important business, although there are very nice oysters got in Kenmare Bay and at Brooklus.

60,611. Having described the various oyster beds all round the coast of Ireland, you lead us to understand that some 20 or 25 years ago, before there were any restrictive laws, the supply was very abundant?—It was very abundant for a while.

60,612. And then, in consequence of the great facilities afforded by railways and steam-vessels to get to the inland markets of the country, the demand for oysters became very great?—Yes, quite so.

60,613. The result of that was that the different fishing grounds became zealously fished, and, in your opinion, over-fished?—Yes.

60,614. That being so, the Legislature stepped in and adopted restrictive laws for the purpose of preventing those beds from becoming exhausted,—is that so?—Quite so.

60,615. When was the Act passed?—In 1842, but it did not get vigorously to work till 1843 or 1844, when we began to work it by means of the Coast-guard.

60,616. What was the nature of the restrictions then enforced?—Principally a close season in May, June, July, and August.

60,617. Had there been none before that?—There had not been any observed. There might have been a close season laid down in the old statutes, but no attention had been paid to it, not in the least.

60,618. What were the months fixed as a close season?—May, June, July, and August. In fact, there were some people who already, by a kind of custom among themselves, kept those four months as a close season. It was said the oysters were only in season in those months which had an R in them.

60,619. But that was a mere understanding?—Yes.

60,620. It became a legal restriction in 1842 and 1843?—Yes.

60,621. What was the effect on the general supply of oysters?—Wherever that restriction has been carried out it has been of great use.

60,622. I think you stated that certain beds, when they became over-fished, were abandoned?—Yes, to some extent.

60,623. The very fact that they ceased to be profitable would, of course, lead to their being abandoned?—Quite so.

60,624. And then they rallied and became good again?—Yes.

60,625. That was a natural effect that would follow without any legal restrictions?—Just so, but where there was any facility for disposing even of the smallest quantity of oysters they were not allowed to rally. For instance, in Lough Foyle and Lough Swilly there were small steamers from Derry, one of which went every day for Liverpool and the other for Glasgow. Before then, it was necessary that a man should have a large quantity of oysters before he could transport them by a sailing vessel, but when the steamers began to run a fishmonger was enabled to send out an order for only a small basket of oysters, and the Lough Swilly people could catch a great many oysters that were left dry at spring tides at low water. Every person who could get a basket of them was able then to send them to a fishmonger's, so that the facilities thus afforded of disposing of the oysters in small quantities told upon the beds.

60,626. The restriction imposed was only, as I understand, by fixing certain close months?—Yes, that was the only restriction.

60,627. Was there no restriction as to fishing the beds during the open months?—Not the public beds.

60,628. Then, in consequence of the great increase in the demand for oysters, and in the facilities afforded for getting them to market, the fact of there being certain close months scarcely prevented the over-fishing of the beds, so long as the people in the locality were permitted to fish them without restriction in the other months of the year?—It did, to a great extent. They can dredge with much more effect in many parts of the Irish coast in those four months of the year which have been made close months than at any other time. There are a great many impediments to oyster-fishing in the winter time.

60,629. From bad weather, and so on?—Yes.

60,630. But I take it from that that the law operated in preventing the fishermen from fishing at the time of the year that was most favourable for fishing?—Yes, but the fish were not good then. There is no doubt that they could have caught more in those months.

60,631. Is it not the object of fishing to catch as many fish as you can?—Yes, provided that you do not exhaust the stock.

60,632. But with regard to the Wexford and Wicklow banks, you told us that you yourselves, namely, the Commissioners of Fisheries, permitted the month of May to be an open month for fishing?—Quite so.

60,633. That does not appear to have caused any considerable exhaustion?—Yes, it did, from time to time, and so much so that some of the people occasionally come to us on behalf of the fishermen and said, "These beds are becoming exhausted; you will have to stop the fishing."

60,634. The policy pursued in Ireland seems to have been to shut up the fishing for a certain number of months, and in that way to prevent the beds from being exhausted,—did that policy arise from any notion in reference to spawning time?—Those are the months in which the fish spawn.

60,635. Have you had your attention so drawn to the subject as to be able to tell us what time the oysters do spawn?—In Ireland, the months of June and July are the greatest spawning months. To some extent, the spawning of oysters seems to be analogous to the spawning of salmon. December and January are the greatest spawning months for salmon. Some begin in October, and the spawning goes on until February, but the spawning that takes place in October and February is very inconsiderable. The bulk of the spatting of oysters takes place in June and July, and in a portion of the month of August.

60,636. Is the spawning in any way affected by the state of the season,—for instance, by there being a very warm June?—I cannot speak to that exactly.

60,637. Has the temperature of the water any effect upon the oyster spawn?—I think that is very likely, but I never investigated the subject in so close a manner.

60,638. Is there a great difference in certain years of spawning, some years being very good and others very defective?—Yes, I am sure there is a difference. In some years the spawning is much better than others; but, as far as I have been able to make an investigation into the matter, I am not at all satisfied with the result. For instance, in the mouth of the Thames here, for the last seven years, there has hardly been any spat at all, I believe.

60,639. Has that been the case at all, within your knowledge, in Ireland. We have never had anything like that. For a year or two the spawning may be defective, but it never came to my knowledge that there was any deficiency like that. If you will allow me, I should like to say a word about that question now.

60,640. The question of spawning?—Yes, and over-dredging. The French Convention Act generally prohibits dredging in the summer months, but it allowed an order to be made in Council to take off that restriction. Immediately that was done, the people all round about here availed themselves of the relaxation. A great deal has been said as to perpetual dredging being necessary, in order to keep off the mud. I am free to admit that there may be a good deal in that, but I say openly that the great cause of the desire to continue dredging is not that which has been assigned. The cause is this. Every one of them, whether belonging to a company or a private individual,—the Whitstable Company or Mr. Wiseman himself, who is now present—dredges all the year round, for two reasons, the principal of which is to lay hold of all the spat he can upon the ground, because there are many customers for it. I have no hesitation in saying that every one of the dredgers, whether from Whitstable, or the Island of Sheppey, or the Essex coast, and even Mr. Wiseman himself, when he is dredging, kills all the whelks and five-fingers, and takes every oyster he can lay hold of. The reason they are so anxious here to continue dredging, and that they were so anxious to obtain the permission to dredge all the year round, is not so much to keep the ground clean, with a view to the future supply of oysters, as to obtain possession of the half-ware. I do not think they are ever actuated in dredging by a desire to keep off the mud.

60,641. But may it not, at the same time, have that useful effect?—No doubt it may.

60,642. Would you acknowledge that to be a useful effect?—Yes, in some places; but my opinion is that, taking it as a whole, it would be far better for them all to confine themselves to dredging during the eight months of the year which are open months, and not to dredging in those four months which the law says shall be close months. If they are dredging constantly and carefully for eight months in the year, I do not believe that the absence of dredging during the remaining four months will materially injure the oyster grounds.

60,643. Have you had any experience of grounds on which the grass or slob which Mr. Russell spoke of grows rapidly in the month of June?—I cannot say that I have.

60,644. A good deal of the evidence we have heard applies to such grounds, and to the injury sustained by permitting the slob to grow unchecked?—I think it would be very well to dredge in the summer months, in order to destroy it; but then the fishermen ought to be required to throw overboard every oyster that came up. I do not see the necessity of taking the oysters away in order to destroy the grass.

60,645. But suppose you allow the fishermen to take them to fishing grounds and to deposit them there, what harm would you do then?—I think if they were left until later in the season they would become better oysters, and I believe also that dredging in that season of the year is very injurious to the spatting, when the oysters are in a spatting state. I believe the oysters would be much more productive if they were left alone, but if it be necessary to dredge where there is likely to be an accumulation of mud or weeds, then I would allow them to dredge, but they should throw all the oysters they got overboard.

60,646. (*Mr. Lefevre.*) But supposing it is open ground, what inducement can there be to the fishermen to dredge, unless they are to have the oysters they get?—I think they would have a great deal more oysters to get, if they would refrain from dredging during those four months.

60,647. But if they were prohibited from taking the oysters, they would not dredge,—there would be nobody to pay them for doing so?—No. I have heard the statements which the fishermen have made themselves before the Committee on the Herne Bay Bill and elsewhere. I was down three or four times at Herne Bay, and I heard the question very much discussed. The ground put forward for dredging all the year round is that it is necessary to keep the ground clean; they never tell us that it is in order that they may take the oysters.

60,648. But how would you induce them to dredge, unless you allow them to take the oysters?—There would be nothing easier than for them to throw the oysters overboard.

60,649. But what inducement would there be for the fishermen to dredge, if they were not to take the oysters?—I think eight months in the year is quite enough for dredging.

60,650. Do you think that dredging during eight months of the year is quite enough to keep down the weeds?—Yes.

60,651. (*Professor Huxley.*) You desire four months close time, on the ground that it will prevent the exhaustion of the beds?—Yes.

60,652. Now how does that work out in practice,—supposing you allow the catching of oysters for eight months in the year, what is there to prevent any quantity of oysters from being obtained in those months? Suppose, for instance, that an oyster merchant desires to get everything he can, and that he sends a steam dredge down, with directions to dredge up every oyster that can be found, do you not think that the scraping of a steam dredge in that manner would do more injury than the ordinary fishing, if it were allowed to be carried on during the four months that are fixed as close time?—I think that the disturbance of the oysters in the months when they are spatting would be very injurious.

60,653. Then would you lead us to the conclusion that it is more the disturbance of the spatting than the actual getting of the oysters that does the harm?—I think also that there would be too many oysters taken.

60,654. But if you have an open season at all, unless you pass some kind of sumptuary law by which you prevent the catching of more than a certain quantity of oysters, you still leave it practicable for the dredgers to double or quadruple the quantity of fish caught?—Yes, but I think it would be impossible to exhaust the beds to the same degree if the fishermen are pro-

LONDON.

W. J. Ffennell, Esq.

16 March 1865.

hibited from dredging during those four months, because they can do a great deal more in the way of dredging oysters in those four months than they can in the winter months. It would be impossible by any dredging at any other time of the year to exhaust the beds to the same degree as by dredging in the four months which are now close months.

60,655. (*Mr. Lefevre.*) Taking a small ground, like that in Lough Swilly or Lough Foyle, could it not be over-dredged in the open months?—The fishing in Lough Foyle is very bad at present.

60,656. (*Professor Huxley.*) Could not the fishermen, by putting on an increased power of dredging, do as much mischief in the eight open months of the year as they could do ordinarily by continuing dredging during the four close months?—Yes, no doubt they could, in some positions, annihilate the oysters altogether.

60,657. Then, if you are to allow dredging to go on with perfect freedom in the open months, what is the use of the close months?—I think there would still be a certain quantity of oysters left to spat in those months.

60,658. But that would not be the case if the fishermen took them all away in the other months?—If they did that then they would be ruined, and I think that over-dredging has been the ruin of the fisheries so far.

60,659-61. What seems to me to be the difficulty in the case, and one which your reply does not meet, is, that if you are to have any open time at all, it is quite possible for those who desire to obtain oysters to send out such a force of dredgers that they would be able to scrape almost everything up?—They would not take those that were upon the culch and pebbles; they would throw those out.

60,662. If you allow an indefinite amount of dredging, I do not see how you are to prevent the exhaustion of the beds?—Certainly not, if there is to be too much dredging.

60,663. No law has yet contemplated the restriction as to the number of dredges that may be used upon the fishing grounds?—No.

60,664. We have had it stated in evidence that steam dredges have been sent out which clear away everything?—The steam dredging is quite a new thing to me. By the ordinary system of dredging I think it would be impossible, upon a large bed, to exhaust the oysters in the same degree by dredging them for eight months as would be done if they were allowed to be dredged all the year round, and then it should be borne in mind that in those four months which are now close months the dredging might be much more effectually carried on than is possible in the other months.

60,665. That would depend to a great extent upon the part of the coast on which the oyster beds are situated?—Yes.

60,666. There is no practical limit to the amount of dredging that can be carried on in February, March, and April on many parts of the English coast?—No, and in those parts of Ireland where the oysters fell off from over-dredging the grounds became so denuded that the fishermen would not go to work for oysters at all.

60,667. That was the result of over-dredging?—Yes.

60,668. So that, in point of fact, the enactment of a close time does not prevent the exhaustion of the beds?—It does not prevent it to the extent that would be advisable in many places.

60,669. Then what regulation would you recommend, in order to prevent the exhaustion of the beds?—I think that the best regulation, if it were well carried out, is that which is the law of the land at the present time.

60,670. What is that?—Not to allow oysters under $2\frac{1}{2}$ inches in diameter to be taken at any time.

60,671. You would leave the small oysters on the beds?—Yes, oysters under that size.

60,672. Have you heard that there is a demand for oysters of a smaller size than that?—Yes, I believe that for some years millions have been obtained from Ireland and from Jersey. Sometimes a vessel has been overhauled, and the oysters put through a ring. Occasionally, they have been thrown out, and sometimes not.

60,673. Suppose the law were to allow you to take oysters of $2\frac{1}{2}$ inches in diameter,—they do not breed at that time, do they?—I believe they do.

60,674. Do oysters under $2\frac{1}{2}$ inches across breed?—I think that an oyster of $2\frac{1}{2}$ inches in April will spat before the summer is over.

60,675. (*To Mr. Buckland.*) What do you think, Mr. Buckland?—I do not think it would.

60,676. (*Mr. Lefevre.*) That will, to some extent, depend upon the size to which the oyster grows when it is a full grown oyster?—Certainly.

60,677. (*Professor Huxley, to Mr. Ffennell.*) You think that oysters of $2\frac{1}{2}$ inches will spat?—Yes, under some circumstances. That one, for instance (*showing an oyster*), would spat. Those delicious little oysters that you get here would spat when of that size. There are many oysters which are not as large as that at all which are full of spawn, and would certainly spat. Talking of the over-dredging, Mr. Buckland stated in his evidence that he conceives if there was a good spatting an abundance of oysters would be produced, sufficient for all purposes, on the large area marked blue on the map. But how has it been for the last 30 years, and particularly for the last 15, during which there have been good years of spatting? Why, there have been nothing like the quantities which the grounds required, which is shown by the fact that enormous quantities of oysters have been brought from Jersey, and immense quantities have been brought from the coast of Ireland, and yet there are not nearly enough, even in the best spatting years, to supply the demand here. For the last 15 years the supply has not been equal to the demand, or anything like it, otherwise the people interested in the fisheries in the Thames would not have gone to Ireland, or brought such large quantities from Jersey.

60,678-80. I apprehend that Mr. Buckland's remark applied to what might be done if the cultivation of oysters on the oyster ground was sufficiently developed?—I understood him to say, that if there was a good year of spatting, there would be an abundant supply of oysters for Whitstable and for all other places. (*Mr. Buckland.*) What I said was, that there would be sufficient to stock the grounds for the next six or seven years. (*Mr. Ffennell.*) I think that Mr. Buckland is mistaken, and I take this fact as a proof, namely, that for the last six or seven years it has been found necessary to bring such an enormous supply from other places.

60,681. (*Mr. Lefevre.*) Do you think that that supply bears any proportion to the quantity of genuine natives that have been produced?—It bears a very large proportion to the oysters produced here for the London markets from the feeding beds.

60,682. Taking the Whitstable oyster fishery, we were informed, when we were there the other day, that the total quantity of young oysters taken from the flats amounts to a very great supply indeed. The average sum paid for brood obtained from the flats and off the Essex grounds was stated to us to be something like 15,000*l.* a year.—Has it been ascertained how much spat has been brought to the grounds in the Thames from Jersey and Ireland?

60,683. Do you suppose that the quantity brought from a distance bears any relation to the quantity obtained in the manner I have stated?—15,000*l.* a year?

60,684. Yes.—A very short time before I left Ireland, perhaps some six years ago, a person came to me who was seeking for oysters, to aid him in getting them, and he told me that his Company paid more than 40,000*l.* a year for oyster spat, which was put upon the beds here in Kent.

60,685, What beds were those?—I think he was a Whitstable man.

60,686. (*Professor Huxley.*) We have here the returns of the Faversham Company, and the whole sale of oysters from its beds is not equal to that.—I believe his statement had reference to Whitstable.

60,687. (*Mr. Lefevre.*) The Whitstable Company, I take it, is by far the largest Company?—Yes.

60,688. (*Professor Huxley.*) The utmost sales of the Faversham Company amount to 15,000*l.* a year?—I am not much acquainted with those details.

60,689. (*Mr. Lefevre.*) 15,000*l.* a year has been paid for the last seven years by the Whitstable Company for brood taken from the flats, and from the Colchester ground?—I have known, in the month of May, as much as 12,000*l.* to be paid to the Arklow fishermen for oysters for the English grounds.

60,690. But were not those oysters required for the Beaumaris ground?—No, I believe they were taken for Kent. A most intelligent man came over there with four vessels from Queenborough. For years the Queenborough men came to the Wexford coast, and they appeared to be most intelligent men, with regard to their knowledge of oysters. The person to whom I refer gave me a great deal of information. He came year after year for a supply for Queenborough, and others came from Whitstable and elsewhere. And then, in addition to the supply obtained in that way from Ireland, you must also take into account the supply which has been got from Jersey.

60,691. We should like to ascertain what quantity of oysters has been brought into the Thames from Ireland and other places. According to the account of the Whitstable people, the quantity has not been large. They say that they do not like the Channel or the Irish oysters, because they do not bring them in the same profit.—I think you could easily obtain information as to the immense supply which for years has been coming into the Thames from Jersey.

60,692. I suppose you are aware that the Jersey beds have nearly disappeared during the last four or five years?—I would go back 12 or 15 years, and I think you could easily obtain reliable information of the enormous quantity in money value which has come from Jersey.

60,693. Are there any means of ascertaining the quantity brought from Ireland?—I should think it will be very difficult to ascertain that, because they have come from parts upon the Irish coast where there has not been a register kept.

60,694. You say that the oysters from Arklow are very large ones?—Yes, very.

60,695. And the great demand here is for small oysters?—Quite so.

60,696. Is not the demand here for oysters less than 2½ inches in diameter?—There is a demand for small oysters, but there is also a demand for large oysters; of course they prefer them small, if they can get them.

60,697. I think the Irish Fishery Commissioners permit the taking of oysters of less than 2½ inches across?—That has been since I left Ireland. It was not done when I was there.

60,698. Do you know what the date of the bye-law was?—The date of the Arklow bye-law must have been about 1848 or 1849.

60,699-706. Then, within your knowledge, was that bye-law observed?—Yes, they have been very strict in observing it, and we had the aid of the Coast-guard in enforcing it. I have more than once caused oysters to be seized upon the quays at Dublin, which have been brought in to be sold to a man who was engaged during May in packing them up in tin cases. That was illegal, because we prohibited them from being brought upon the shore. Seven or eight years ago, a large cargo was taken over to Beaumaris, in the month of May, when it was legitimate to take them, but the people there did not like it. They alleged that they were thrown out upon the public ground, so near a private bed that it would induce the people to encroach upon private property. In that case, the Coastguard came and poured gas tar upon them, in order to destroy them, but we made them refund to the men who took the oysters over something like 80*l.* for the cargo.

60,707. We had a complaint at Carlingford, from some of the women of the place, that they were prohibited in the summer during the close season from gathering the oysters, although that was the only time at which they could take them. They were oysters that were above the level of low water at spring tides?—I can easily understand that.

60,708. Do you think it ought to be allowed?—No, it ought not to be allowed.

60,709. On what ground; they are not oysters that could be taken by the dredgers?—But they would fructify and add to the spat. I do not agree with Mr. Buckland as to the quantity of oysters necessary to supply spat. I think that the great proportion of the spat will escape. There is no doubt that an oyster produces some millions of spat, but I believe that that is necessary, just as it is with the salmon, on account of the destruction that takes place. For instance, a 20-lb. salmon will produce 20,000 young, but it is necessary, in order to stock a large river, that there should be thousands of salmon in it. The great Tay has thousands of salmon in it, and an enormous quantity is obtained for food, but I think that all the ova that come to perfection would be not more than would be produced by five or six pair of salmon. In the Galway river the same thing happens.

60,710. (*Mr. Caird.*) If they were all brought to perfection, or one-half of them, the supply would be enormous?—Yes, but I say that is impossible in the operation of nature. The Galway fishery has been a great success; it has been brought up from 300*l.* a year to 4,000*l.*; but if you come to look at the number of salmon obtained there, you will easily see that they might only be the produce of one 15-lb. or 16-lb. salmon.

60,711-12. (*Mr. Lefevre.*) Do you think that the ground can be so cleaned of oysters, as not to leave a sufficient number to act as parent oysters, and to supply the brood?—Yes, quite so; and I think it essentially necessary that there should be a considerable number of parent oysters left, especially when it is considered that millions of spat will only produce tens of oysters.

60,713. Looking, however, at the estuary of the Thames, it is to be observed, that the spat of the private beds bears a relation to the spat upon the public grounds. On the private beds at Whitstable, there are plenty of oysters, and they say that they seldom find a good spat upon the public grounds when they do not find a good spat upon the private grounds?—There are many private grounds on the Thames which get no spat at all; the oysters are said not to spat there; and there is the Clare coast, which I have already mentioned to you, where they never get any spat.

60,714. Quite so; there are private grounds where there is no spat, but there are other grounds where they do spat?—I believe they do spat, but by the race of the tide it is all carried away. They all spat, but the spat itself is carried clean off. There is another question upon which I will take the liberty of saying a few words to the Commission, and that is with regard to legislation, to enable grounds, such as Herne Bay grounds, to be taken up and converted into private property. I think that is advantageous, not only for the purpose of increasing the supply of oysters, and for enabling a large supply of food to be obtained for the country, but also for affording employment to the people. It is quite impossible, in my mind, that a common oyster ground can come to much good for anybody. The Herne Bay Company have obtained their Bill, which places in their possession ground upon which they propose to cultivate oysters. I took an active part in trying to obtain

LONDON.

W. J. Efennell, Esq.

16 March 1865.

that Bill for them. I believe it was a very right step to take, and I hope there will be legislation to enable similar measures to be taken. I do not say exactly in the same way, but to enable parties to obtain possession of grounds for the cultivation of oysters, which are now comparatively, if not altogether, profitless. I am always an out-spoken man, and do not hesitate to express my own opinions, and with respect to the Herne Bay Company, I must say that the course now being pursued by the Woods and Forests is highly objectionable, and altogether unwarrantable.

60,715. (*Mr. Caird.*) In what way?—In charging rent for the ground. I think it about the most unwarrantable thing which could be thought of. The Legislature has given the Herne Bay Company these banks for the cultivation of oysters, and now the Woods and Forests step in and want to charge them a heavy rent for them.

60,716. (*Mr. Lefevre.*) I understood it was intended by the Committee of the House of Commons to reserve the question of rent?—No, not at all. Words were introduced into the Act, which are the ordinary words, saving all rights the Government may possess, but the Crown had no right whatever to take oysters off the grounds, under the provisions of Magna Charta.

60,717. (*Mr. Caird.*) The Crown had no exclusive right?—It had no right except in the water. The Herne Bay Company have obtained their Bill, and power to lay down oysters there, and now the Woods and Forests step in and say, you shall not lay down any oysters there, unless you pay us an enormous rent for doing so. The Herne Bay Company are consequently in a state of suspense about the matter. I believe the Woods and Forests talked about some enormous sum, either for the purchase of the ground or in the shape of rent. Something like 3,000*l.* or 2,000*l.* a year, or something of that sort.

60,718. (*Mr. Lefevre.*) The exclusive right of fishing upon a coast of that kind must be a very valuable matter?—Yes.

60,719. The right belonged originally to the public, and, if it is granted to a Corporation, it is not unreasonable to suppose that they should pay something for the privilege?—But to whom should they pay it?

60,720. To the public.—But it is the Crown that claims it in this case.

60,721. That is the same thing.—The Prince of Wales, if he comes to the throne, may say, "instead of this money, I will take the Crown lands."

60,722. I imagine that the foreshore of this ground belongs to the public, or to the Crown as representing the public, and any rent obtained for it would go into the public purse.—Virtually, it is the Crown all the time, and not the public. The reason I was anxious to submit this question to you was this,—I feel anxious to promote this movement as much as possible, because I hope that it will have the effect, eventually, of turning the coast to a profit, but the course which has been taken by the Woods and Forests is a downright obstacle to that.

60,723. But, if the exclusive right of fishing is worth a considerable sum of money, surely the public ought to receive some benefit from it. Take the Whitstable ground, for instance, that would sell for a very large sum of money, would it not?—Very probably it would.

60,724. It is of very great value indeed, and the land adjoining that ground may be of equal value.—But I have no doubt that no Company can take up ground of this sort, and convert it into a good fishing ground, without conferring immense advantages upon the public.

60,725. Would it not answer your purpose if such grounds were required to be put up to competition?—I think that would be a fair principle, but I do not see how you could carry it out in this case, after an Act has been passed.

60,726. This is an individual case.—There are other Bills now before the House seeking to do similar acts. I have in my possession one of them, in which clauses are proposed by the Woods and Forests which would leave the promoters entirely at their mercy.

60,727. I believe that one of these Bills proposes to appropriate a portion of the River Crouch,—a considerable portion of it?—Yes.

60,728. But supposing that the soil of the river, both above and below the place sought to be taken, lets for a considerable sum. Then should not a Company seeking to appropriate that ground be called upon to pay an equivalent rent to the public for it?—If it were put up to competition, there would be something paid for it; but I do not think the Woods and Forests ought to claim the rent for the Crown. I am decidedly of opinion that, in the case of the River Crouch, if the exclusive right to the ground is to be given to any person at all, those persons who have the beds above and below should have the preference, and should have an offer made to them to take it at a fair valuation. I think that, in justice to them, that ought to be done.

60,729. If you were to carry out your theory, and were to prohibit the taking of oysters below $2\frac{1}{2}$ inches in diameter, would you not take away very much from the value of those private beds?—No, I think not.

60,730. Does not the value consist in the power of obtaining small oysters and laying them down upon those private beds, in order that they may grow into bigger ones?—My idea of state economy is to do that which would produce the greatest source of revenue to the country.

60,731. Is it not the object of those private beds to grow small oysters into big ones?—Yes, it is.

60,732. But if you prevent oysters below $2\frac{1}{2}$ inches from being taken altogether, will you not prevent those private beds from making a profit?—I think oysters of $2\frac{1}{2}$ inches are quite small enough to take.

60,733. Do you think so because that is an eatable size?—Yes, I think so. You might reduce the size a little, but it is only a question of degree. I think there ought to be some limit as to the take of small oysters, and I do not think that would eventually injure the trade of those people. When everybody is made to do the same thing, a restriction of this kind does not press so hardly upon individuals as they think at first.

60,734. Then you do not agree with the Whitstable and Colchester people, that to lay down that restriction would be ruin to them?—On the contrary, I think that a vast deal more food would be produced to the country, and that the fishermen would not be injured by it.

60,735. (*Professor Huxley.*) With your knowledge or belief that the supply of oysters is falling off now, what practical measure would you suggest as a remedy? I understand you to say that you would keep up the close time as at present?—Yes.

60,736. Also the restriction as to the size of the oysters to be taken?—Yes.

60,737. You would maintain those regulations as they exist at present?—Yes, as they are at present. But I do not say whether for those particular places where the taste is so much for small oysters, and where the oysters, being a bit too large, have their value deteriorated, the size might not be reduced by a quarter of an inch, or something of that kind. I think, however, that there ought to be some rule carried out as to the size of the oysters which are to be taken, and if the size of $2\frac{1}{2}$ inches was diminished at all, it should be only very little.

60,738. Would you simply enforce what are strictly the present provisions of the law?—Yes.

60,739. (*Mr. Caird.*) Do you think it very essential to the success of the oyster fisheries that there should be any restrictions at all?—I do; and there is another thing I would suggest as essential in keeping up the supply of oysters for the great demand that has arisen, and for developing that resource

of the country, and that is, that the close time should be strictly carried out.

60,740. You yourself, I believe, recommended that the month of May should be made an open time upon parts of the Irish coast?—Yes.

60,741. Then would you have May an open time here?—Yes, under certain circumstances. In such cases, for instance, as where the oysters were not fit to eat. I would then allow the fishermen facilities for obtaining them in the month of May in order to take elsewhere, but I would have that privilege a limited and exceptional thing. The third thing which I consider essential is, that there should be suitable legislation to enable banks and portions of the coast to be taken by private parties for the purpose of cultivating as oyster beds, as in the case of the Herne Bay Company. I think that is the most essential thing of all.

60,742. But cannot that be done at present, under the system of private bill legislation?—I think it can.

60,743. There is nothing to prevent it, in the present state of the law?—The only thing is, the terrible expense that it is to individuals to come before Parliament for every bill. I think there might be some general legislation, by which power might be given to some department of the State to confer the right of establishing such companies, without obliging every company to come before Parliament, at an enormous expense.

60,744. (*Mr. Lefevre.*) Under the Irish law, you have the means of giving licences of that kind?—Yes.

60,745. That has not produced any great result at present?—No; but I believe that in a few cases it has answered well.

60,746. What is the reason that it has not worked more satisfactorily?—I think that one cause is the want of knowledge upon the subject. There has been great difficulty in seeking out suitable places. People went at random, quite in the dark, and asked for licences for establishing oyster fisheries on parts of the coast which no one could tell were suitable.

60,747–8. Do you think the restriction as to the take of small oysters in Ireland may have had anything to do with the fact that these beds have not been worked to a profit?—They have not restricted the take of small oysters at all, unless it is since I left Ireland. That was a part of the law which I never saw carried out.

60,749. (*Professor Huxley.*) Can you suggest to us any mode of preventing the exhaustion of the beds by over-fishing them in the open season?—No; that is a very difficult question to deal with.

60,750. Is it at all practicable?—I think that legislation enabling the grounds on the coasts to be converted into private property, as in the case of Herne Bay, would do some good, because private persons would not exhaust the beds for their own sakes.

60,751. But that would not affect the deep-sea beds?—No, not the public grounds.

60,752. Is there any measure practicable to prevent the over-fishing of the public grounds by persons who might find it expedient to take up everything they could?—There is nothing, except a limit as to the size. That would go a very great way, I think, and it ought to be strictly enforced.

60,753. (*Mr. Lefevre.*) Do you think it advisable to permit the sale of oysters during the close season?—No, certainly not; and every day in the year, from all places where they can be obtained, there are oysters selling in London.

60,754. There are oysters selling in the London market constantly?—Yes, every day in the year, whether they have a licence or not.

60,755. You would put a stop to that?—Yes; a restriction of that kind has done an immense amount of good in Ireland. There, no person can offer an oyster for sale after the close time comes in.

60,756. (*Mr. Caird.*) How has it done an immense deal of good, when you tell us that the quantity of oysters is not increasing?—It rallied when the close time was in force.

60,757. (*Mr. Lefevre.*) Take the Arklow and Wexford beds. Those are the principal places from which oysters are sent over to Beaumaris, where they are laid down for a month or two, and kept to feed the market in the close season?—I believe there has been a good deal of that.

60,758. You would put a stop to that?—Yes, certainly, everywhere.

60,759. (*Professor Huxley*). Would you prevent oysters from being taken for the purpose of being laid down elsewhere?—The Act in Ireland provided for that. We had no power under the Act to permit the sale of oysters during the month of May, otherwise than for laying down. It was penal for them to be brought ashore at all for the purpose of sale. They were only allowed to be taken for the purpose of transplanting. Upon the Clare and the Arklow coasts, when they got them, they could not sell them for consumption until September.

60,760. But they could be sent over to Beaumaris, and sold there during the close season?—Yes, they could be sold there the day after they arrived.

60,761. Is that not, in fact, the principal demand for those oysters?—Beaumaris is a great place for taking those oysters.

60,762. The principal demand for Arklow oysters is for sale during the close season?—Yes, but there has been a large demand in the close season for oysters for the coast of Kent, and latterly for France.

60,763. (*Mr. Caird.*) Your recommendation for increasing the probable future supply of oysters is to increase the number of private beds on which oysters may be cultivated and fed?—That is the main thing.

60,764. You think that is the best remedy?—Yes, by far the most important; but I also think that the Woods and Forests should be restrained from being an obstacle.

60,765. (*Mr. Lefevre.*) I imagine that the Arklow beds provide by far the largest quantity of oysters sent from Ireland?—Yes, by far the largest quantity in the way of export.

60,766. And also the supply to the market in Ireland itself?—No, they are not eatable, and they are not sought for for consumption there. The export trade is their best trade. I believe they take a good many from Arklow and plant them at Malahide, and they take a great number and plant them on the good Carlingford grounds, but the main trade from Arklow has been for England.

60,767. It was stated to us the other day by Mr. Wiseman that there has been the same scarcity of oysters on the private beds as upon the public grounds, and that cannot be from over-working, because the private interests of the owners would prevent that?—I take it that that applies to the oysters on that great area at the mouth of the Thames. I think the reason of the falling off of the supply is because too many oysters have been taken and sold, and the spat has not been allowed to accumulate.

60,768. Then how is it that there never was a scarcity until within the last five years?—Because the demand has been getting greater, and the supply from Jersey has fallen off. I should like to say a word, before you finish my examination, as to trawling.

60,769. Your experience of trawling applies to the Irish coast?—Yes, entirely to Ireland. I think trawling a most useful mode of fishing, and that it should not at all be stopped; but at the same time I am of opinion that trawling should not be allowed inside the headlands in shallow water. I think it is better for the trawlers themselves that they should be kept out in the deeper water. I believe that will serve their purpose much better than fishing within the headlands.

The witness withdrew.

LONDON.

H. Wyrill.

16 March 1865.

HENRY WYRILL called and examined.

60,770. (*Mr. Caird.*) You have been a fisherman, and are a fish salesman at Scarborough ?—Yes.

60,771. And you have had a long experience of the state of the fishery at that place ?—Yes, I have been 20 years there as a fisherman, and 10 years as a salesman, altogether I have been 30 years connected with the business.

60,772. During those 30 years has there been a marked increase or decrease in the general supply of fish there ?—Taking the period of 30 years during which I have been connected with the business up to the present time, I should say there has been an increase of above one half in the quantity we send at present compared with what we sent formerly.

60,773. There has been an increase of one half in the fish sent to the market ?—Yes.

60,774. Of all kinds of fish caught off that coast ?—Yes; during that time there may have been a falling off of one class of fish for a year or two perhaps.

60,775. But at this moment, compared with 30 years ago, there is double the quantity of fish now caught ?—Yes.

60,776. Has there been an increase in the number of men and boats engaged in fishing ?—Yes, about one half.

60,777. Then the increase in the number of men and boats will bear a fair proportion to the increased quantity of fish taken ?—Yes, I think so.

60,778. What are the different kinds of fish caught at Scarborough ?—Sole, turbot, flounders, haddock, cod, brill, and plaice.

60,779. Are they caught by the trawl net ?—Yes.

60,780. They are trawled fish ?—Yes.

60,781. Has the system of trawling been long carried on upon the coasts adjoining Scarborough ?—About 30 years ago, I believe, there were only two trawl vessels—I mean large deep-sea trawlers there, but since that time they have increased out of Scarborough, until they now number about 35 trawlers, leaving the Hull and Grimsby vessels out of the question.

60,782. Is trawling at this moment at Scarborough a profitable business ?—Yes.

60,783. Do trawl-vessels frequent ground which has been trawled over for many years in succession ?—That will depend upon the winds. Sometimes they would wish to go upon other grounds, and the winds will prevent them. They then try upon the ground nearer the land, but as a whole they do not extend 15 miles east and west more than ever they have done since they first commenced. It is about on the same ground that they trawl.

60,784. They have not been obliged to go to a greater distance, and seek new ground in consequence of the old ground having been fished out ?—Not at all.

60,785. Is there any long-line fishing practised at Scarborough ?—Yes.

60,786. What kind of fish are caught ?—Cod, ling, skate, haddock, and halibut.

60,787. Do the long-line fishermen and the trawl-net fishermen fish on the same ground ?—Yes, nearly so.

60,788. They do not come into collision or injurious contact with each other ?—Sometimes they do, but not often. The long-line men invariably stop inside the trawlers; that is generally the case.

60,789. So that the trawlers do not come into contact with the long-lines ?—I do not think that I have heard of a single case of that sort during the whole of last season.

60,790. Has the long-line fishing been as successful and prosperous as the trawl-fishing in the course of the last 20 years ?—The long-line fishing has varied. In 1845 and 1846 there was an abundance of fish, so much so, that I myself bought at one time 1,000 codfish and ling, as the result of one day's work. I sent them into the English market.

60,791. Were they caught by the long-lines ?—Yes; but three years after that, the fishing came down greatly, until, in 1859, the long-line fishing became hardly worth looking after. In fact, there was not a living to be had from it.

60,792. During that time, was the trawl-fishing prosperous ?—Yes.

60,793. And, at the same time, the long-line fishing was not ?—Yes; but having so many men, and so much capital invested in it it was persevered in, and the cod-fishing has been found very profitable for the last three years. Indeed, I never knew the cod season to be better than it has been during the last two seasons.

60,794. Do you think that has anything to do with the quantity of herrings that frequent the coast ?—Yes, I believe it has, because we have observed that there are herrings on the ground the whole of the year round.

60,795. Do you find that when you have a good herring year, you have also a good cod year ?—Not as a general rule, because sometimes the herrings overswim the codfish, and become masters of the field, driving all the cod away. As a general rule, we find that the codfish are outside a shoal of herrings, and not in the centre, and when the herrings are very thick they take the ascendancy, and the cod have to retreat.

60,796. The fact that the cod have become very plentiful would show that no permanent injury could have been done by the trawl-fishing ?—Not the least.

60,797. Although in 1859 the cod very much fell off, they have now become more plentiful than ever ?—Yes, that is the case.

60,798. The trawl-fishing has been continued during all the time ?—Yes.

60,799. What kind of bait do you use for your line-fishing ?—Herrings, if we can possibly get them. We use herrings for cod-fishing.

60,800. Do you find that the most deadly bait ?—Yes.

60,801. Are there many haddock taken by line ?—There are not a great many haddock taken by line.

60,802. Are they chiefly taken by the trawl ?—Yes.

60,803. Are they sent fresh to the market ?—The chief of them are sent fresh.

60,804. Is there a large drift-net herring-fishing off Scarborough ?—Yes, it is very extensive indeed.

60,805. Is it carried on during all seasons of the year ?—We commence in July, and continue it until we finish in November.

60,806. Is there no fishing in the months of January and February?—Not in the shape of a herring season.

60,807. There is no herring season then ?—No; but we have been making more progress with our herring-fishing for the last four or five years than we did formerly. We have commenced as early as the fore part of June, and have gone on until November.

60,808. You never fish in the spring months ?—No.

60,809. Has the take of herrings been on the increase of recent years, as compared with what it used to be ?—It has been on the increase as regards the supply to the English markets; but I do not think that it has increased on the whole. It has increased in consequence of having so much extra tonnage and superior nets.

60,810. By means of superior tonnage and nets, have you had a larger catch of fish ?—Yes, by one half.

60,811. Has that been a progressive increase ?—It has been stationary for the last seven or eight years, except from local causes, such as gales of wind.

60,812. There has been no marked falling off in the herring fishery ?—No, on the whole it has been progressively increasing, inasmuch as we have had, for the last two or three years, a considerable increase

in the takes. In 1861, 1862, and 1863, I sold hundreds and hundreds of lasts of herrings for the small sum of 3*l.* 10*s.* a last.

60,813. Did that arise from their extreme plentifulness?—Yes, they were so plentiful, that I have seen them stacked upon our beach like haystacks; there were from 700 to 800 and 900 tons laid up in one day at our station, and there would be as many left behind.

60,814. Would there be as many as from 700 to 800 and 900 tons of herrings sent away in one day?—Yes.

60,815. Sent away to the interior of the country fresh?—Yes, fresh and salted.

60,816. Would that continue for several days in succession, or was that large quantity quite exceptional?—It would continue for a whole week, or perhaps ten days sometimes.

60,817. Then the herring-fishing must bring in a good deal of money to Scarborough?—Yes, a great deal.

60,818. Have you any idea how much?—I could not say exactly. It would take me a little time to arrive at anything accurate.

60,819. Does it produce as much as all the other kinds of fishing put together?—Yes, and more.

60,820. Then it is a more profitable fishing than all the rest?—Yes.

60,821. (*Professor Huxley.*) How many boats would there be?—We have as many as 400 boats.

60,822. Would they all go in full of herrings on those great occasions?—Yes.

60,823. (*Mr. Caird.*) What would be the weight of a full fishing in one boat?—Perhaps 400 boats might come in with one last each.

60,824. (*Professor Huxley.*) That would be 10,000 herrings each?—Yes. There you would have the weight I mention, as each last would weigh two and a half tons.

60,825. Is it not uncommon for them to come in with one last a-piece?—Some of them would have one last, and some as many as three or four lasts. Sometimes we have as many as 400 boats in one day, and if they get 10,000 herrings each, you would have the weight I have mentioned at once.

60,826. You never have a winter herring-fishing?—No.

60,827. Have you never thought of looking for them in the winter time?—We, as practical fishermen, say that it is better to leave them alone, although we might catch them in the winter. We think it is more advantageous for us to wait until the proper time.

60,828. Are you aware that other people do catch them, both north and south of you?—I think they may suffer in their regular fishing in consequence.

60,829. Where do the herrings come from which come upon your coast?—I have studied the subject for some years, and my opinion is that they are in the deep water now, or inside and north of the Dogger Bank; they are lying on the soft ground now.

60,830. What makes you think so?—Because we can take them out of the codfish, which are taken up in the trawl nets. One of my captains told me the other day, that he opened one codfish, and there were 13 herrings that came out of its gut, as if they had never been touched. I think that the herrings are lying there at the bottom, and as the warm weather comes in they will come in closer to the shore to spawn. We follow them from the outside to the inside, and from the inside to the outside, as regularly as a shepherd following a flock of sheep.

60,831. What time do you get herrings full?—In the month of August especially they are in the most healthy condition. They come into our shores then as a healthy fish with a small hard roe.

60,832. They are about eight or nine inches long then?—Yes.

60,833. What month is that?—In the month of August, and as the season approaches we see that they get full, and the common opinion is, that they deposit their spawn soon after.

60,834. Do they spawn about the beginning of September?—Yes, in that month, and as soon as they have done that they commence to go to sea again, as the weather becomes cold.

60,835. By what month do they disappear again?—In the latter part of September they begin to go off, but we follow them off, and we fish among them until November.

60,836. Do you find full fish up to November?—Yes, but generally they are a mixed fish in November.

60,837. When do you get the greatest portion of spent fish?—In the middle of September in-shore, but there have not been as many spent fish on our coast for the last year or two as we had previously.

60,838. You do not remember any winter fishing at all in January or February?—No.

60,839. Are not herrings taken then sometimes?—Only in the cod; they are not taken by any other means.

60,840. Are those which you find in the cod full fish?—No, they are spent.

60,841. In February?—Yes; they are spent now.

60,842. By spent do you mean shotten?—Yes, shotten.

60,843. Have they recently become shotten?—I cannot say whether they have been shotten five days or five weeks; all I know is that they are shotten.

60,844. Might they be fish that were shotten in November?—They might.

60,845. Do they come full again in February? Have you any reason to believe that?—No, I believe not. I believe they lie in the deep water until the warm months come in.

60,846. Have you much of a haddock-fishing?—We have not a great deal of haddocks caught in our part, although we practise long-line fishing very extensively. Nevertheless, the quantity of haddocks is as great as might be expected.

60,847. Has it fallen off of late years?—No, our long-line fishing is purely adapted for the cod, ling, and skate, and not for catching haddocks.

60,848. Then you cannot say whether the quantity of haddocks has fallen off of late years or not?—I should say that it is about the same as it was.

60,849. Are there many haddocks trawled?—Yes.

60,850. Are they good haddocks?—Yes.

60,851. Do people eat them readily?—Yes.

60,852. They do not find that they fall ill after eating them?—No.

60,853. We have had remarkable statements from your part of the world as to that?—What I am speaking of is from my own knowledge, and I give it to you as an honest Englishman. I have sold this year at Scarborough haddocks as high as 2*s.* per stone for the purpose of being sent to the metropolis, and I have been applied to for them from Dan to Beersheba.

60,854. For trawled haddocks?—Yes.

60,855. Are line haddocks used much as bait?—When we cannot get herrings we fly to a second bait, and we obtain that by cutting haddocks up and putting them on the hooks.

60,856. Would not the market for line haddocks be better than for the trawled haddocks that are sold?—I have been astonished and provoked at it.

60,857. At what?—Why, that our line haddocks in the London markets do not fetch any higher price than the trawled haddocks. We send them up to the market almost as if they were alive, with every scale upon them, and they get into London the next morning after they are caught, yet when they get up to Billingsgate they realize no more per basket than the trawled haddocks.

60,858. Would not that go to show that there is not much difference between them, because the Londoners know what is good to eat?—They show that they have not a proper sense of what we term the best fish. The haddock caught by the hook and

LONDON.

H. Wyrill.

16 March 1865.

line has not a scale off it, and looks as bright as if it were alive.

60,859. But you could not tell one from the other when they are both cooked ?—I do not think there is much difference then.

60,860. I presume that is what the Londoners care the most for ?—Perhaps so.

60,861. (*Mr. Caird.*) It has been stated to us that the haddocks caught by the line are got on the rough ground, and that they are as fine fish as those which are caught by the trawl ?—There is a certain time of the year when, if we were to put a piece of cow's liver on the hook, we should catch a certain class of haddock that would be nothing but skin and bone. Of course, that class is nothing to compare with trawled haddocks, but as a general rule they are as good fish which we catch in the trawl net as those which we catch by the hook, and frequently they are a higher fed fish.

60,862. A better fed fish ?—Yes, as a whole.

60,863. (*Professor Huxley.*) You have a large number of herring-boats going out from Scarborough ?—Yes.

60,864. I think you said 400 ?—No ; there are many of those strange boats, that visit the place.

60,865. How many have you at Scarborough ?—We average about 60, of from 30 to 40 tons register ; and then we have 40 of a smaller class, making a fleet of about 100 altogether.

60,866. Are your smaller boats undecked ?—Yes.

60,867. The larger boats are decked ?—Yes.

60,868. Do the decked boats and the undecked boats fish together ?—Yes, in the inside fishing, at the first commencement of the season, from July until September. The big boats then go outside, and the small boats give up altogether.

60,869. Is any practical inconvenience found to arise from the two classes of boats fishing together ?—Sometimes there are rows among them.

60,870. Is there more disturbance than if the decked boats fished by themselves, and the undecked boats by themselves ?—It would not be possible to do that. Of course, if the fishermen have any idea where the shoal of herrings is, they will be there, whether their boats are decked or undecked.

60,871. Have you ever found any objection made to the decked and undecked boats fishing together ?—No.

60,872. Would you like to have any regulation made, requiring the decked boats to keep outside the undecked boats, or *vice versâ* ?—No.

60,873. Do foreigners come to fish off Scarborough ?—Yes, the Frenchmen are a great nuisance.

60,874. Has anybody pretended to carry out the Convention Act there ?—No. I have been astonished and indignant at the way in which the Frenchmen have come and usurped authority over the fishing grounds. They come there, and altogether defy our British fishermen. They have generally a much larger class of vessels, and as soon as we get our nets laid down, extending out for perhaps a mile and a quarter, they will put their heavy nets right on the top of them, and sink them to the bottom.

60,875. Does no cruiser interfere ?—There has been a French cruiser, but, instead of cruising where the fishing has been going on, they have been carousing at our hotels for a week and a fortnight together.

60,876. Do they come and fish within the three miles limit ?—Yes. That Act has never been put in force at all.

60,877. Would you like to have it put in force ?—Yes.

60,878. But if you have one part of it put in force, you must have another ; and there is one provision which states that, whenever decked and undecked boats are fishing together, the two shall keep apart, and shall not fish upon the same ground ?—Yes, I believe there is a regulation of that kind.

60,879. Do you think that it would be of any use to enforce that provision ?—I am acquainted with the Act, but I really think that that part of it would be an injury rather than advantageous.

60,880. The part relating to the decked and undecked boats ?—Yes ; it would be a great injury if the undecked or the decked boats were compelled to go beyond a certain limit, where there was really no fish. The result would be that the owners' capital, invested in fishing, would suffer, and likewise the people of the country, because there would not be the same supply of fish.

60,881. Would it not practically give the decked boats the command of the sea, they being able to keep the sea and take up their ground ?—This is my position. It would not be worth my while to go and fish where I know there are no herrings, and many times the herrings are within a certain distance of the shore,—sometimes half a mile,—in about four or five fathoms of water.

60,882. But if the decked boats are occupying the ground, the regulation is that the undecked boats shall not fish within a certain distance of them, would not that give the decked boats the command of the fishing, as they can keep the sea better than the undecked boats ?—If they were bound to go half a mile outside the smaller boats it would not be so.

60,883. But if they got on the ground first, then the smaller boats must go outside them ?—I have examined the business part of the question on both sides, and, as regards our British fishermen, I think that that provision of the Act would be better left out.

60,884. What do you think of that part of it which relates to the lighting of the boats. One of the regulations of the Convention Act is that herring-boats, while fishing, shall have two lights, one 6 feet above another ?—That is not at all practicable. In our large decked boats we have a mast 50 feet long, and the Act requires that the lights shall be shown on the mast, but we invariably lower our mast down within four or five feet of the deck, or we should not be able to fish at all.

60,885. You do not lower the mizen ?—No.

60,886. Then why not hoist the lights on that ?—We generally hoist the lights on a six feet staff in the boat, and there is an understanding that, in case of a collision or accident, or any mishap, a signal is to be hoisted in the shape of a flambeau torch.

60,887. There would be no practicable difficulty in having two lights. You have an upright for one ?—Yes.

60,888. Then why not have a second one ?—We should require to have it six feet above the other.

60,889. The Act requires that you shall have two lights, one above the other, in order to distinguish a herring-boat fishing from one under way ?—Yes ; but if we were required to have lights up on the mast-head, we should be compelled to keep the mast continually up.

60,890. Is there anybody who troubles himself about the Convention Act at Scarborough ?—No.

60,891. You do as you like ?—Yes, pretty much.

60,892. Does anybody trouble himself about the vane he carries on the mast ?—No, not at present.

60,893–4. That has been a dead letter, in fact ?—Yes.

60,895. How do you contrive to work one with another when you are trawling ? Do the trawlers interfere with the herring fishermen ?—Sometimes.

60,896. Is there anybody to enforce the regulation that trawling shall not take place within three miles of the drift-net fishing for herrings ?—No.

60,897. Do they trawl within three miles ?—Yes.

60,898. Is any mischief done in consequence ?—Yes, sometimes.

60,899. Then would it be better if that regulation were enforced ?—Yes.

60,900. How could it be enforced ?—Some such regulation should be attended to wherever practicable. It would be of no use to carry out the law as it is altogether. Unfortunately, the smacks as a whole are too reckless. They know that they are the strongest, and I have seen them go right over a fleet of drift-

nets in broad daylight, and cut the warps right in the middle.

60,901. How are they to be identified when they are fishing at night. If, for instance, a trawler comes and cuts off the tail of a fleet of nets, how is he to be identified?—That is one difficulty, but we have, in many instances, taken steps to find out who did it. I myself and other people have actually left the remainder of the nets in the sea, when an injury of that nature has been done, and have gone in search of the persons who did it. Two years ago I had a master who chased a smack for two days and nights and lost him after all.

60,902. Then he would lose his nets as well?—Yes, he lost the nets also; he lost me altogether something like 400*l.*

60,903. I presume that is a kind of zeal you do not approve?—No; but if he could have caught the vessel who did the damage, we could have obtained compensation for the loss.

60,904. Are there any provisions in the Convention Act which you would like to see carried out?—The system of lighting, as a whole, I think, would be a benefit, and the vane system would be no injury.

60,905. What is the practical good of the vane system?—I do not know; but with regard to the lighting of the boats, that is quite necessary, and I think that the French vessels ought to be kept a certain distance outside of the British waters.

60,906. Would that be necessary if you had an active cruiser working about and ready to take cognizance of any injury that might be done?—But that is not the case.

60,907. Do the French fishermen compete with you in your own markets?—No.

60,908. I presume, then, you would not mind their fishing near you, if they behaved themselves properly?—No, if they did that, we should not object, but we know perfectly well what a Frenchman is.

60,909. How is it that you put up with that? Are you under-manned?—They generally have larger vessels, and they have more men than we have. I recollect, in one instance, a fellow got up a musket from the deck, in order to shoot me. We came into collision, and I suffered 20*l.* or 30*l.* damage in consequence. Had I been as stubborn as he was, there would have been life sacrificed.

60,910. Have you any regulation as to the size of the mesh of the herring nets?—We have none enforced by any Fishery Board.

60,911. Do you make the mesh of any size you like?—Yes.

60,912. Is there no one to interfere with you?—No.

60,913. You know what the inch mesh is?—Yes.

60,914. Do you think it would be of any advantage to enforce that?—Our meshes are above that.

60,915. You use a larger mesh of your own free will?—Yes, we have large quantities of nets coming from Scotland, and never have any that run less than 30 meshes to the yard.

60,916. Are you a trawler?—I have capital invested in trawling now, and in the long-line fishing, and in the herring department as well.

60,917. You are aware that, in the Convention Act, there are a good many regulations as to trawling, and the size of the beam?—Yes. I see nothing objectionable in the Act in that respect.

60,918. Do you think there is any necessity for those regulations? Do you not think that your own interests would make you adopt all the regulations that are requisite?—Yes. It would not do for us to have a beam too long, because we should be the losers, by having them broken.

60,919. Is there anybody who troubles himself to see whether the beam is of a certain length or not?—No.

60,920. Are there many trawlers out of the port of Scarborough?—We have now from 28 to 30 out of the port of Scarborough.

60,921. How many were there 15 years ago?—Perhaps there were only two or three engaged in trawling in the deep sea.

60,922. Has the capital which has been employed in building the trawlers which have been established since come out of the pockets of the fishermen and of those who have been engaged in fishing?—Yes, there has been a great deal of *bonâ fide* capital of that sort invested. There are exceptions, but, as a rule, the business has been lucrative to the fishermen, and they are in a better position than they were 15 years ago.

60,923. Then may we take it that, on the whole, trawling has paid?—Yes, it has.

60,924. Have you invested money in it?—Yes.

60,925. And you do not find any reason to repent having done so?—Not at all.

60,926. Is it reasonable to suppose from that, that the supply of fish by trawling has not fallen off?—We have got more for the last two or three years than ever we did.

60,927. (*Mr. Lefevre.*) Are the trawlers at work all the year round?—Some of them, and some of them we rig up with the herring rig when the herring season comes on. We have two sets of masts for them.

60,928. You take out one set and put in the other?—Yes, we put in fresh masts.

60,929. What is the tonnage of those boats?—They average from 35 to 40 tons.

60,930. Are the same boats used sometimes in long-line fishing?—Yes, the same class of boats.

60,931. What is your season for the cod?—We commence in the latter part of January.

60,932. How long does it go on?—Until May.

60,933. Where do you get herring bait from?—From Scotland, but we shall now have to go to Yarmouth, if they have done fishing in the Forth. They are about to commence at Lowestoft what they call the spring fishing.

60,934. Would it be of any disadvantage to you, if you were not able to get spring herrings from Lowestoft and Yarmouth?—Yes, there is nothing like herring bait.

60,935. Do you get a considerable quantity from the middle of March to the end of May?—Yes.

60,936. Do the Frenchmen bring their herrings to your shore at all?—No, not at all.

60,937. How many hands do they have on board?—From 22 to 24.

60,938. What do they do with the herrings they get?—They salt them in barrels.

60,939. Would you object to their bringing them into Scarborough?—Not if they allowed us to go to their ports.

60,940. Then if you had an opportunity of taking your fish to France, you would give them the same liberty of taking theirs to Scarborough?—Yes, and I wish that was done. Where the Frenchmen, with 24 men, can catch one last of herrings, we can catch five with 10 men. We have a better method of fishing, and finer materials.

60,941. Your nets are better?—Yes.

60,942. Do you think that your men could make a profit by taking fish over to the French ports and selling them there?—Yes, if they were admitted entirely free, or only upon payment of a nominal duty.

60,943. The fishermen of Scarborough would not object to see the Frenchmen come in with their fish there, if they had the same privilege of taking their fish to France?—No.

60,944. Would it be of advantage to them to go and sell their fish there?—Yes, it would be of great advantage.

60,945. What number of French vessels come off your coast during the season?—They come down in a fleet, to the number of 150. They commence fishing in Scotland first, and then they fish all the way down the coast until they reach us.

60,946. When they fill their boats, do they go

LONDON.

H. Wyrill.

16 March 1865.

home and come back again ?—Yes, I have known them make two voyages off our ground.

60,947. What number of fishermen are there belonging to Scarborough ?—I do not know exactly, we have 50 boats, with 10 men each, in one department ; that would be 500. I should say there would be 600 altogether.

60,948. Six hundred ?—Yes, or a few more than that.

60,949. Have they been doing well, generally, for the last few years ?—Yes, as to fishing on the whole, Scarborough has no reason to complain, but rather the contrary.

60,950. Where does the other portion of the 400 boats you have mentioned, as fishing off that place, come from ?—From Yarmouth and Lowestoft.

60,951. Do they bring the herrings into your port ? —Yes.

60,952. Are there many trawlers that do not belong to the port that bring their fish there ?—Yes, a good many Hull and Grimsby vessels do; we had five in the other morning.

60,953. Are the fishermen generally paid by shares ?—They are paid by shares in the smack department.

60,954. But not in the herring fishery ? — We generally have about four leading men who are paid by shares. Perhaps they will have a portion of the nets at the same time, and that gives an impetus to their energy.

60,955. The others are paid by wages ?—Yes, including the shell fishermen we have a larger number of men than I mentioned.

60,956. How many ?—Perhaps 1,000.

60,957. You have 1,000 fishermen altogether, including the crab and lobster department ?—Yes.

60,958. Is that a considerable fishery ?—Yes, there is a good deal done in it.

60,959. Has there been any falling off of late years ?—There has been no falling off in the quantity, but there has been in the quality. Since they have introduced a pot instead of a trunk, they have brought a great deal more smaller fish to the shore than they ought to do.

60,960. Do you think, as a rule, that they make less than they did by it ?—I believe they make more, but whether the crabs and lobsters will continue to supply this sort of catching or not, I do not know.

60,961. What is the difference ?—One mode of fishing is purely by a hoop and a net, with a piece of bait put in it, and in the other they use a machine like a bird-cage, or a rat-trap with a hole to go in at, and when the crabs and lobsters go in they cannot get out again.

60,962. (*Mr. Caird.*) Is it a more killing mode of fishing ?—Yes, very small crabs creep into these small pots, and they cannot get out again.

60,963. How long has that mode of fishing been adopted ?—Five or six years.

60,964. Is there no falling off in the supply at present ?—No, only there is a great quantity of small crabs brought into the market, and ultimately it may have a tendency to injury the supply.

60,965. (*Mr. Lefevre.*) How many men are employed in that business ?—About 200.

60,966. What extent of ground do they go over ?—A distance of about 14 miles.

60,967. Is that seven miles on each side of Scarborough ?—Yes, each side of Scarborough Castle.

60,968. Is the crab and lobster fishing carried on all over the coast ?—Yes, at Whitby, Filey, Staithes, Flamborough, and all along the coast.

60,969. Do they go now and catch crabs ?—Not at this time.

60,970. What is the season ?—They commence it in the month of May or the latter part of April.

60,971. How long does it go on ?—It goes on up to August.

60,972. Do they take the crabs and lobsters when they are in spawn, with the pea in them ?—Yes ; but generally, when they are soft, they cast them away again.

60,973. That is when they are casting their shells ? —Yes.

60,974. They bring them to land when they have the pea in them ?—Yes.

60,975. (*Mr. Caird.*) Is it only to the herring-fishing that the boats from other parts of the coast come to your place ?—They come to no other fishing than the herring-fishing, except the Hull and Grimsby smacks, which give us a call if the wind is contrary. In that case, they call into our port, and sell their fish there.

60,976. The French, Yarmouth, and Lowestoft boats fish exclusively during the herring fishery ? —Yes, but the English boats fishing then sell at Scarborough, unless they think they can realize a higher price by running away with a fair wind.

60,977. They do not come on the coast for any fishery except the herring fishery ?—No.

60,978. (*Mr. Lefevre.*) Are lobsters found all the year round on your coast ?—There are a few at this time of the year, but only very few.

60,979. Do they go into deep water ?—I believe they do.

60,980. Do they come in-shore to breed ? — I believe they do.

60,981. Would it interfere with the business very much, if taking lobsters with the pea in them were prohibited ?—Yes, it would interfere with it very much.

60,982. Would it be practicable to carry out such a regulation ?—It would be practicable to carry it out, but it would require some one to see that it was carried out.

60,983. Is not a very considerable portion of their profit derived from the lobsters with the pea in them ? —Yes.

60,984. There is a very great demand for them ?— Yes ; what we call a berry hen will always fetch sixpence more.

60,985. Have any complaints been made by the fishermen of the practice of catching the lobsters with the pea in them ?—No, not by the fishermen.

60,986. They have no regulation themselves about it ?—No ; and they take them irrespective of size. All are fish that come to the net.

60,987. The lobster fishermen make no complaint about catching small lobsters ?—No.

60,988. Is there a better price for the small than for the large lobsters ?—No, the large ones fetch the most. The pea lobsters bring in the most money.

60,989. Taking the lobsters generally, are the small ones more sought after in the market ?—No, the large lobsters are the best.

The witness withdrew.

W. Wyrill.

WILLIAM WYRILL called and examined.

60,990. (*Mr. Lefevre.*) Are you brother of the last witness ?—I am.

60,991. How long have you been a fisherman at Scarborough ?—I have been a fisherman there for 55 years.

60,992. Have you been engaged in all kinds of fishing ?—I have been engaged in all kinds of fishing.

60,993. During that time has the fishing at Scarborough very much increased ?—During that time the fishing has increased beyond any calculation that at the present time I am able to make.

60,994. Can you give us any idea of the number of fishermen there were at Scarborough 55 years ago ? —At the commencement of my career ?

60,995. Yes.—The number of fishermen ?

60,996. Yes.—I should think that the number of fishermen in Scarborough when I commenced fishing would be between 30 and 40 at the outside.

60,997. It has increased from that number to nearly 1,000 ?—Yes, from that up to 1,000, according to the statement my brother made.

60,998. You agree with his statement generally ?—I agree with his statement generally. I do not know that there is any defect whatever in any statement he has made.

60,999. Do you agree with him, that if the fishermen of Scarborough had liberty to take their fish to France, they would be ready to concede to the Frenchmen the right of taking their fish into the port of Scarborough ?—I think, with the facilities the Scarborough fishermen have now, that it would be one of the greatest boons to them which they ever yet realized.

61,000. It would be throwing open a fresh market to them ?—It would be throwing open a fresh market, and there are facilities of carriage of a nature which they did not possess a few years ago.

61,001. In what way ?—The boats we used to have were very small. I know the time when there were only one or two large boats of the same tonnage belonging to Scarborough, as there is now such an immense number of. Hence you will perceive from that, that the facilities for the conveyance of fish to the foreign markets, even in the same vessels that are catching them, would be a boon the extent of which I cannot fathom or describe.

61,002-3. Are there cargoes of fish ever sent from Scarborough to France now ?—No. (*Henry Wyrill.*) I have sent three or four cargoes of fish to Dieppe and other places, as a speculation, but what with the local duties and the high commissions I could not make it pay. It would be necessary for them to realize a very high price, or there would be considerable loss on the transaction. I lost 250*l.* by it.

61,004. Have you tried it since the French Treaty?—Yes.

61,005. And have not found that it has paid ?—No, in consequence of the high charges. There is a town's duty, as well as one in connexion with the Customs. It is a duty of something like ninepence a hundred.

61,006. Is that duty paid by the French boats also ?—No, they do not pay it.

61,007. So that the Customs duty at present charged, together with the town's duty, amounts almost to a prohibition ?—Yes.

61,008. (*To William Wyrill.*) Do you think that the French boats would bring any considerable quantity of fish to Scarborough, if they had the liberty to do so ?—They might bring a certain quantity, but their facilities for catching herrings are nothing as compared with ours.

61,009. Would you concede to them the liberty of fishing within three miles of the shore, if you had the liberty of taking fish to their markets ?—I do not say that, and for this reason, the Frenchmen, place them where you will, are not what we call fair fishermen. They will take an undue advantage, if they can, not only in getting what we call a berth, which is in laying their nets too close to ours, and in many cases right on them, but, in addition, they are not honest. I have known instances in which they have taken away the nets altogether.

61,010. But that is a question of police. I believe that you said you suffer from that already, beyond the three-mile limit ?—Yes, we suffer from them in that way now. My view of the question is simply this, that they ought to be prohibited from coming among us, on the certain tenor of the law as it now stands. But you ask if I would allow them to come and fish among us, if we had the privilege of taking fish to their markets ?

61,011. Yes, and making it a free ground for everybody ?—I cannot exactly answer that question. It is a difficult point at present. If the Frenchmen would do as the English do, and act fairly one towards another, there might be no objection to that.

61,012. What part of your herring fishery is carried on within the three-mile limit ?—That portion which we call our home fishing.

61,013. How much of your fishing would you say is carried on within the three-mile limit ?—From the time that the boats commence in the latter part or the middle of July until September.

61,014. The fishing during that time is within the three-mile limit ?—Yes.

61,015. And after that you go further off ?—Yes; after that the herrings begin to get out again, and we have to follow them. The sea is then open to every one.

61,016. What time do the Frenchmen generally make their appearance off your coast ?—They generally come there about August. They go down to Scotland, in the first instance, and work their way up to Scarborough. As they find the Scotch fishing fall off, they come further south, to meet the Yorkshire fishing, as we term it.

61,017. Do they now fish to some extent within the three-mile limit ?—I have not been to sea myself for the last few years, and am not prepared to answer that question, but from what I have heard, there have been several complaints against the Frenchmen in reference to the injury they have done.

61,018. Do you think that trawling does any harm to the herring fishery ?—No, no more then my laying this pen upon the table.

61,019. With the exception that they sometimes cut through the nets ?—Yes, they may do injury to the property of the fishermen in that way.

61,020. Do you think there is any mode by which that may be prevented ?—Yes, there is a law now in existence, and, I expect, if it were carried out, that these men would not be able to come within a certain distance of the herring-boats. I am sorry to say, however, that that law has not been carried out, and that very serious injury has been done to the property of the herring fishermen by the mode of procedure adopted by the trawl vessels, and in some instances certain poor men have been almost beggared by it.

61,021. Have you any interest in any trawlers yourself ?—No, not now; I am a fishmonger and game-dealer by trade, but I go out catching crabs and lobsters in the summer time.

61,022. Do you think it would be possible to carry out the law prohibiting trawlers from coming within three miles of the herring-boats ?—It would be possible.

61,023. How would it be possible ?—It would be possible; but then, before it could be made possible, the men going in the trawling vessels would have to become men of principle, acting upon the maxim, "Do to others as you would wish to be done by." You cannot follow a man in a black dark night when he has cut your nets asunder, and, in many cases, you would not know until the next morning that you had lost them, and by that time the person who did the injury might be 20 miles away from you.

61,024. Have you observed any falling off in the haddocks of late years ?—I cannot say that I have exactly observed any falling off in the haddocks, and if there was a falling off, I am one of those men who believe that there are things which take place in the sea that have a tendency to interfere with the progress and increase of fish.

61,025. You think there are natural causes at work ?—There are natural causes to which you might attribute the falling off of fish in the sea, even if it was the case, but I am not prepared to say that it is the case generally. There may be a falling off for one, two, or three years, but it generally recovers itself. What have we seen in the last few years ? The last year or two has proved more prolific in the produce of the sea than any previous years; under these circumstances I do not know what conclusion we ought to arrive at.

61,026. You have noticed, then, a variation in different seasons ?—Yes.

LONDON.

W. Wyrill.

16 March 1865.

61,027. You cannot say that there has been any general falling off?—No, nothing of the kind.

61,028. Was the last year a very prolific one for fish?—Yes.

61,029. What kind of fish?—The last season was a very good season for herrings.

61,030. And for haddocks, too?—There were more caught this winter than I have known to be caught for a number of years.

61,031. How was it with regard to cod?—They also were very good. Even our small boats have done remarkably well this winter, and as for the haddocks, the smacks have caught a very great abundance.

61,032. (*To William Wyrill.*) Do you agree generally with your brother in the evidence which he has given to us?—I agree generally in what he has stated.

61,033. Do you represent generally the views of the Scarborough fishermen?—Yes, I believe that what we have said here is the opinion of the fishermen generally in Scarborough.

61,034. Have you ascertained their views?—Yes, we have had the subject talked over *pro* and *con*, a great many times, when it was expected that the Commissioners would go to Scarborough. What I have expressed here is the general opinion of the fishermen with regard to the fishing interest in Scarborough. There may be exceptions, but not many.

61,035. Is it the general idea and wish not to have any fresh laws on the subject, and no interference with the fishery there? Is that the general desire?—Yes, I believe that is the general desire, unless something may be done as regards the French question, and the light signals.

61,036. I do not know whether the question was put to you as clearly as it has been to your brother, and therefore I will put it again. Would the fishermen of Scarborough, in your opinion, be ready to concede to the French the privilege of fishing within the three-mile limit, if you were allowed to go there?—I think I can state what the universal opinion is on that point. If the French would concede to us the same privilege that we concede to them, as regards the fishing grounds on their coasts and their markets, it would be a very great advantage to us as fishermen. We could doubly outfish them. We would, as far as we are concerned, give them anything and everything. We would let them come right alongside of us, so long as they did not commit any depredation.

61,037. (*Mr. Caird.*) You would allow both Frenchmen and Englishmen to fish where they pleased, and take their fish to whatever market they considered best?—Yes, we would have a fair field and no favour.

61,038. (*Mr. Lefevre.*) Have you known any application made to the magistrates against the trawlers under the Convention Act?—No, not one.

61,039. Nor against the Frenchmen?—No, not one.

61,040. During all the years you have been at Scarborough you have not known any fines imposed under the Convention Act?—No, not one.

61,041. Then the provisions of that Act do not appear to be of much benefit?—No; we have not moved a great deal in the matter.

The witness withdrew, and the inquiry was adjourned until the 25th of March.

London, Saturday, 25th March 1865.

PRESENT:

Professor HUXLEY, F.R.S. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

T. Turnnidge.

25 March 1865.

THOMAS TURNNIDGE called and examined.

61,042. (*Professor Huxley.*) You hold an office under the Thames Conservancy?—Yes.

61,043. What is the nature of that office?—I am assistant river-keeper; that is the nature of my occupation.

61,044. What are your duties?—My duties are to see after the fisheries from Crowstone up to Thames Haven, in the mouth of the River Thames. At that part of the river the jurisdiction of the Conservancy extends to both sides of the river.

61,045. To both sides of the river?—Yes, to the Kentish as well as to the Essex side, but it does not run as far as across to the Medway. I have a book of byelaws to go by, and I am required to obey all the instructions I find there. That book touches that part of the river on which I am placed. I believe that the rules of the Conservancy apply to the whole of the river running from Crowstone up to Staines Bridge, but that part of the book I do not study. The part of the fisheries that lies within my jurisdiction is the only part I attend to.

61,046. Have you that book here?—No.

61,047–53. Can you give us a general idea of the nature of your duties as defined by the book?—Yes, I can as near as possible. In the first place I am required to board the boats and examine the nets. If I find the meshes are under the proper size then it is my duty to seize the nets, or otherwise to report the name of the person using them, and his place of residence to the Thames Conservancy. Then, if they choose to take steps in the matter, well and good. I have no power to summon an offender until I am requested to do so by the Board; they give me my instructions.

61,054. What is the legal size of the mesh of the flounder-net?—Two and a half inches.

61,055. Is that $2\frac{1}{2}$ inches from knot to knot, or the extreme length of the mesh when pulled out?—From knot to knot. We measure it in this way (*describing*).

61,056. That is the extreme length of the mesh when pulled out and is equivalent to $1\frac{1}{4}$ from knot to knot?—Yes, but we do not measure our nets in that way.

61,057. I have measured this net, and I find it is $1\frac{1}{2}$ inches from knot to knot?—Perhaps so.

61,058. That would be three inches pulled out?—Yes.

61,059. Is that the legal size?—Two and a half inches is the legal size; they must not be under $2\frac{1}{2}$ for catching dabs and flounders.

61,060. Are the nets you speak of nets used for dab and flounder-fishing?—Yes.

61,061. Is there any other net employed by the fishermen in the Thames?—Yes.

61,062. What is it used for?—It is a smelt-net.

61,063. That is a seine-net, is it not?—It is netted in a similar manner to this one, and runs out to 16 fathoms in length.

61,064. Has the flounder-net the mesh of a seine-net?—No, it is a straight net, netted three score over.

61,065. In fact, it is what we call a seine-net?—Perhaps so; I do not understand seine-nets.

61,066. Is it drawn ashore?—Yes.

61,067. The general length of the seine-net is 16 fathoms?—Yes.

61,068. What is the depth of the net from the head-rope to the foot?—I can hardly say.

61,069. How many meshes is it?—I do not know.

61,070. Then is the smelt-net of the same kind of construction?—The mesh of the smelt-net is $1\frac{1}{2}$ inches.

61,071. Is it of the same construction?—Yes, measured in this way. It will not be quite so much the other way; but measured in this way, when it was netted, it should be $1\frac{1}{2}$ inches.

61,072. The only difference between a smelt-net and a flounder-net is that the smelt-net has the smaller mesh?—Yes.

61,073. Measured the diagonal way, the one is not more than $1\frac{1}{2}$ inches, the other being $2\frac{1}{2}$?—Yes.

61,074. Are there any other nets used?—Yes, trawl-nets.

61,075. What kind of trawl-nets are used; of what size are they?—Some are 16 and some 18 score in the head, and then down to about 50 at the bottom of each side.

61,076. What is the length of the beam of the trawl?—From 16 to 18 and 20 feet.

61,077. Are the boats used in working them decked or undecked?—They are decked boats.

61,078. Are the trawls of the ordinary construction?—They run about five fathoms long, with a three-inch mesh at the head and a mesh of $2\frac{1}{2}$ inches down at the cod end.

61,079. Is that the regular legal size?—Yes, it is the legal size according to my rules.

61,080–1. You have instructions to report such nets as are below that size?—Yes.

61,082. Are there any stow-nets used?—Yes, at Leigh.

61,083. What is the size of the mesh?—I cannot find any instructions about that in my byelaws at all.

61,084. Then can they use meshes of any size they like?—I believe they have them netted of one regular size. I do not see that there has been any difference in them from the time I was a boy until now.

61,085. What is the regular size?—I think it runs from about half to three-quarters of an inch from knot to knot.

61,086. On the diagonal?—Yes, that is as near as I can come to it.

61,087. Is there any other kind of net used?—Yes, shrimp-nets.

61,088. Are they the ordinary hand shrimping nets?—No.

61,089. Are they shrimp-trawls?—We do not call them trawls. There are shrimp-trawls in Leigh as well as fish-trawls.

61,090. Will you explain the mode of catching shrimps; what is the size of the shrimp-net?—From three-quarters of an inch in the cod end, down to one half.

61,091. Three-quarters of an inch on the diagonal?—Yes, in the cod of the net.

61,092. That is the same size as in the stow-nets?—Yes, as nearly as possible.

61,093. Are there several kinds of those shrimp nets?—No, they are all the same, only one will have four rands, and another six, according to the size of the boats. The smaller boats will have two rands, those that are a little bigger will have three, and the larger boats will have four or six.

61,094. How are those shrimp-nets fitted to the boats; and in what way are they worked?—They have a piece of oak about $2\frac{1}{2}$ inches deep and $3\frac{1}{2}$ inches wide; they have a staple fixed into that piece of oak standing out for a foot and a half, then they have two holes chiselled and filled up with a certain quantity of lead, perhaps 25 or 26 lbs.; at the end a screw or staple is fixed to which a rope is attached; in the middle an upright stick is fastened and a line leads from that to the bridle; the warp is made fast to the bridle and extended to the boat.

61,095. It is like a kind of little trawl?—Yes, only that a trawl is worked with a ground rope.

61,096. You pay out the warp until the net reaches the ground, and when you find it working hard you consider that you have sufficient warp out?—Yes.

61,097. The beam goes along the ground?—Yes.

61,098. Are there any hand shrimp-nets in Leigh worked by men wading near the shore?—Yes, at the back end of the year; at the end of the summer there are a few who do that for the home market; they go into the creeks and get the shrimps there, but they are principally the same persons; their nets are made in the same form but they do not require any lead upon them. There is no difference in the size of the mesh but there is in the size of the nets. Two rands of twine would be sufficient to make the nets they use for that purpose.

61,099. What other methods of fishing are practised at Leigh over which you have to exercise supervision?—My principal business is to look after the shrimping.

61,100. We have spoken now of the trawlers, of people who catch flounders with nets, and of the shrimp-fishing, and of the stow-boat fishing?—Yes, and trawling.

61,101. Is there any line-fishing?—Yes.

61,102. Is it your business to inspect the line-fishing at all, or do you allow the line fishermen to do as they like?—The only business I have with the line fishermen is when they are catching bait within my limits; they catch plaice, and bullrights for bait, but if they do not make a sale of any of them I have no right to interfere with them or to seize the fish; they can catch fish and bring it for bait right up to the shore, or they can go away with it. If I board their boat and find that they have fish seven inches long I have no power over them, but if I catch them bringing small fish ashore then I can seize the fish.

61,103–5. Have you ever done so?—No, never.

61,106. They are allowed to catch fish when small for the purpose of bait?—Yes, but there are not many fishermen who follow that business.

61,107. About how many boats are there engaged in shrimping?—I can give you a list of the lot that there is in the town. I believe this list (*handing in a document*) is a correct statement of every one; I think there are 114 altogether, and 11 row-boats.

61,108. What are those boats used for?—They are used by people who go out and get a few cockles and mussels.

61,109. Are there 80 or 90 shrimpers?—There are more than 100 when they are all at it. I think I can account for about eight boats from Leigh that never go out shrimping.

61,110. Eight out of 114?—Yes.

61,111. What do they employ themselves in?—Five belong to Mr. Alston, and they go dredging sometimes at Cheiney Rock, and sometimes they are laid up; then there are three that belong to Mr. Plum, and one out of those three goes stow-boating, and the other two work for mussels in the winter.

61,112. How many trawlers are there?—There are about six when they are in full work that go out trawling.

61,113. How many line-boats are there?—Sometimes there are eight, and sometimes 10, and I have known as many as a dozen, but this year there were not more than six that went to it.

61,114. Do the boats off here which are employed sometimes in shrimping at other times go lining?—Yes.

61,115. But the trawlers require heavier boats do they not?—No.

61,116–7. Do they work with the same boats that go shrimping?—Yes. Perhaps they will work the trawl for a week, and then they will go shrimping. It is just for about one month in the spring of the year, and two months at the fall of the leaf that they go trawling.

61,118. On the average how many men are employed in each boat?—There are about 60 boats in which there are two men to a boat. We call them men from about 18 years of age to about 50 or so, some of them may be a little older; then the remainder of the

LONDON.

T. Turnnidge.

25 March 1865.

boats have a man and a boy in them except one or two which go out with one man alone.

61,119. Do those people employ themselves solely in fishing ?—Yes.

61,120. They are not occupied in any other way?—No.

61,121. They are fishing all the year round ?—There are between 40 and 50 who never go out for anything else but shrimping.

61,122. Is there any trotting for whelks, or how do do you catch whelks ?—Our people do not go trotting; I went once myself for a fortnight or three weeks, but did nothing at it.

61,123. Is there no considerable whelk-catching of any kind ?—No.

61,124. Is there any mussel-fishing ?—Yes, there is a little mussel-fishing, but it is only very little now. A man of the name of Plum stocks his ground with them.

61,125. Have you any control over the mussel fishery ?—No.

61,126. Is there any considerable cockle fishery ?—Yes, there are a great many cockles.

61,127. Does that fishery provide employment for many persons ?—Yes, there are about 11 small boats that practise that almost every day.

61,128. Are they people who form part of the 114 you include in the return here ?—No ; if you look at it you will find that there are 11 row-boats put down ; they are the boats that principally go cockling.

61,129. How many persons are employed in each of the row-boats ?—Not more than one.

61,130. One man in each ?—Yes.

61,131. Do they go out on the flats when the tide is out and dig the cockles up ?—Yes ; they are generally men who have been fishermen all their lives but who are getting old, and are not fit to go out to any other description of fishing. If it happens to be a fine day they will go out among the ships and see if they can sell a few cockles or fish.

61,132. Is there any restriction as to the take of cockles ?—They are not allowed to take any brood within the jurisdiction of the Conservancy. They must not take cockles until they are fit for the market.

61,133-4. At what size do you consider cockles fit for the market ?—About an inch and a quarter from the front of the shell to the nib athwart the back of it.

61,135. Could you seize a cargo of cockles if you found small ones among them ?—If I were to find them getting cockles upon the ground that were of a small size I should go out to them and tell them not to take them. I should tell them that they were doing wrong, and perhaps I might seize a sample of the brood and make the Conservancy Board acquainted with the fact. In that case they would send me instructions down what to do. If they require me to proceed any further in the matter they send me a letter and a notice to serve on the men, but generally no further steps have been taken. In receiving an intimation from me that they were doing wrong the men have left off, and have not committed the same breach of our regulations for years.

61,136. Is there any considerable oyster fishery at Leigh ?—There is no oyster brood that falls about the Leigh.

61,137. Are there any oysters laid down there ?—Yes, a few.

61,138. Are they public or private grounds upon which the oysters are laid down ?—They are private grounds.

61,139. Then have you no jurisdiction over any oyster fishery there ?—No, unless there was a spat of oysters to fall within my jurisdiction ; then I should have power.

61,140. Has that never been the case ?—Not since I have been concerned in the river Leigh.

61,141. How far does your jurisdiction extend inland ? Supposing for instance you were to see a cartload of undersized cockles some distance inshore, would you have any right to interfere ?—I have just as much right to interfere with any man who has undersized fish ashore adjoining the River Thames as I would have to interfere with the boats themselves.

61,142. What do you call adjoining the River Thames ; how far from the river ?—I should say the shores of the Leigh.

61,143. Does your jurisdiction extend 10 miles inland ?—No.

61,144. How far does it extend inland ?—I do not know.

61,145. Have you any power to seize or interfere with a person having undersized fish in his possession unless you could prove that such fish came out of the Thames ?—That is a question I cannot answer.

61,146. Practically, has such a case ever arisen ?—If I catch a person with fish in his possession in my jurisdiction, and I find that those fish are undersized, I consider that I have a right to seize them.

61,147. Whether on the land or in the boats ?—Yes, either on land or on the water.

61,148. But you do not know how far inland your jurisdiction extends ?—No, but I act in this way : sometimes it blows so hard that I cannot go on board the boats, and then I go to the shores—to the boiling houses close to the edge of the water. My instructions tell me that I am able to board any boat, vessel, or craft, and there to take and seize all unsizeable, unseasonable, and unwholesome fish. I can always seize all nets that are under size, and the instructions go on to say that I may do that on the shore adjoining to the said River Thames. So that I have as much power in the case of a man bringing his fish out of a boat to the land as I have if I find them in the boat.

61,149-50. Are you not aware what the precise meaning of the words "adjoining the River Thames" is ?—No, I do not know how far the power would extend.

61,151. Have you ever found a costermonger's cart two miles from the shore with undersized cockles in it ?—No.

61,152. No case of that kind has arisen ?—No, not in my time.

61,153. You take it for granted that if you find fish in the boiling houses along the River Thames that they came out of the Thames ?—That is a question that might want explanation before a bench of magistrates. I believe it would be legal to seize them if they were specimens of fish such as are always caught in the Thames.

61,153. But suppose the cockles were brought from some other place into Leigh, would you have any authority over them ?—I do not think I should interfere in such a case.

61,155. Would you not have the power ?—I think not ; but there is one thing I should do. If they were getting cockles that were not fit for the market I should stop them, or at any rate attempt to do so; and if they declined to stop, then I should report them.

61,156. If the cockles had been taken from the bed of the Thames ?—Yes.

61,157. Do you consider that your jurisdiction extends only to Thames fish, or to any other kind of fish, so long as they are brought ashore within the limits of your jurisdiction ?—That would be a question for the law to decide. I do not know how that would be.

61,158. You do not know ?—No.

61,159. You are not aware whether a case has ever been tried ?—I had a case at Rochford once which was argued.

61,160. What was the precise nature of that case ?—A man who had in his possession undersized fish obstructed me in the execution of my duty.

61,161. Where were they obtained ?—From the Thames.

61,162. That is not a case in point. The case I want to put is this : Did you ever find it your duty to interfere where the fish had not been taken out of the Thames ?—No.

61,163. That does not seem to have occurred ?—No, it never has occurred.

LONDON.

T. Turnnidge.

25 March 1865.

61,164. How long have you known the fishing at Leigh ?—I have lived in Leigh all my lifetime.

61,165. Then for the last 40 years or so you have paid attention to the fishing ?—Yes.

61,166. Have you noticed any remarkable increase or diminution in the quantity of fish which has been yielded by the fisheries there ?—I believe that during the last seven or eight years there have been more floating fish and more shrimps, but there have not been so many shell-fish, such as oysters and so on. I think so because there have not been so many brought there to be laid down.

61,167. But apart from that description of fish, do you think there are as many cockles, for example, as there were ?—Yes, I believe there are as many cockles as ever.

61,168. Within your recollection, has the number of fishermen increased ?—Yes.

61,169. And has the number of boats also increased ?—Yes.

61,170. Are the boats of the same construction now as they were formerly, or are they better boats ?—They are now a great deal better and larger.

61,171. They cost more money ?—Yes, they cost a great deal more money.

61,172. Have you any reason to think that the money invested in the boats in this way has all come out of the pockets of the fishermen ? — Yes, I believe so.

61,173. At any rate it has been worth somebody's while to put money into the fishing ?—I think that the whole of it has been earned by the fishermen. Mostly all the boat owners are fishermen.

61,174. Is it a common thing for a man to begin by working in a boat and then gradually to acquire a boat himself ?—A young man may save up a few pounds, and then get a friend to lend him money, and by that means obtain a boat. His circumstances go on improving, and he has another boat built. I have known several men who originally had no boat, but who have now got two or three, and some of them four boats.

61,175. So that on the whole there has been no falling off in the supply of fish ?—No, I think not. I think that shrimping and the fisheries of all kind at Leigh are better now than ever they were, and that there is more money earned.

61,176. Is there any restriction as to the time of year when shrimps are to be taken ?—I think there is in the byelaws. There is a time at which they are to be taken, but that regulation has never been enforced since I have been here.

61,177. Have they shrimped all the year round ?—Yes.

61,178. I suppose there is a very great demand for shrimps ?—Yes.

61,179. They catch as many as they can ?—Yes, that are fit for the market.

61,180. What is your regulation with regard to shrimps fit for the market ; what is the size at which they are allowed to be taken ? Have you any regulation at all upon the subject ?—There is no specific size mentioned.

61,181-2. Then what do you mean by shrimps fit for the market ?—They ought not to be taken when they are small, as they are nothing but brood.

61,183. Can they catch very small shrimps in a common shrimp-net ?—Yes.

61,184. What regulation is there affecting that practice ?—I have to go on board and see that they sift the small ones out, and that they throw them into the sea alive.

61,185. Can they save them alive in that way ?—Yes, but not the whole of them. There must be some destroyed. That is safe to be the case in all fisheries.

61,186. Do they use a kind of sieve, or what ?—Yes.

61,187. A sieve ?—Yes.

61,188-93. Will you explain to us what the construction of it is ; what sort of a sieve is it ?—It is a piece of hoop run athwart with iron bars, and bound round with copper. It is simply formed of bars running across the sieve. Two halfpennies put together would drop through the straight bars of the sieve. They use various kinds of sieves ; there is one they call the penny sieve, and another the halfpenny sieve. In the winter time it is just so that two halfpennies will drop through ; the next size is a sieve that will allow an old pennypiece and a halfpenny to drop through.

61,194. When they get up their shrimp-nets do they put all the contents into the sieve ?—Yes ; they cull out the dirt, and sift the shrimps in a sieve, and the small ones are thrown overboard ; or they sift them on deck and throw them over at once, washing the deck down with buckets of water.

61,195. When was that regulation introduced ?—That has been a regulation carried out for the last 50 years, I should say, at Leigh.

61,196. Has it been effectual in preventing small shrimps from being destroyed ?—Yes ; it tends to save the life of the brood. That, I believe, has resulted in increasing the supply of shrimps. There was a great quantity of shrimps last summer.

61,197. Do the fishermen complain much of the delay caused by the sifting of the shrimps ?—No.

61,198. Does it take them very long ?—No.

61,199. (*Mr. Lefevre.*) Is it done on the ground when they take up the trawl ?—Yes.

61,200. Immediately ?—Yes.

61,201. Do they shrimp all the year round ?—Some boats do.

61,202. But only a few ?—There are from 40 to 50 sail that keep fishing all the year round.

61,203. At what time of the year do they find any great quantity of small shrimps ?—In August, September, October, and so on.

61,204. Do they fish mostly outside the boundaries of the Thames ?—No ; some of the largest boats may be a week and not shoot in the boundaries, and sometimes they may shoot every day in the boundaries.

61,205. Is the greatest quantity of fishing at Leigh carried on within the boundaries or without ?—I believe there are as many fish caught without the boundaries as there are within.

61,206. Is there also a considerable quantity of shrimping carried on from Gravesend ?—Yes.

61,207. And from Southend ?—No.

61,208. From Thames Haven ?—No, there is not there.

61,209. What number of boats is there from Gravesend ?—I do not know.

61,210. Is there an inspector for the Conservancy Board also there ?—I do not know if they have a river-keeper there or not, but there is a harbour-master ; and I suppose he looks after that matter, but I do not know.

61,211. Were you inspector of Leigh before the notice with regard to the fisheries was issued ?—No.

61,212. In 1859 ?—No.

61,213. You cannot tell us then when it was that this notice was issued ?—No.

61,214. Do the shrimpers bring in any quantity of small fish of any other kinds ?—I never saw any bring in undersized fish.

61,215. I do not mean undersized shrimps, but small flounders and so forth ?—Not undersized, but they are allowed to bring them in under 7 inches.

61,216. They pick out the small fish which they take on board and throw them overboard ?—Yes.

61,217. Do you think the regulation with regard to the size of the fish is observed, and that no fish below the size here mentioned are really brought in ?—I never found on board the boats any undersized fish.

61,218. Are these the regulations of the Board with regard to the size of the fish :—

" No flounder under 7 inches, from the eye to the " end of the tail."

" No sole under 7 inches, from the eye to the end " of the tail."

LONDON.

T. Turnnidge.

25 March 1865.

"No plaice or dab under 7 inches, from the eye to "the end of the tail."

"No smelt under 6 inches, from the eye to the end "of the tail."

"No whiting under 6 inches, from the eye to the "end of the tail, under pain to forfeit and pay "5*l.* for every such offence?—Yes."

61,218*a*. Have you since you have been inspector prosecuted any men for a breach of these regulations?—No.

61,219. You have not found it necessary to do so?—No; I never found a net so small as the size allowed, and I never found more than one lot of fish under size since I began to board the boats.

61,220. Do the shrimpers and trawlers fish on the same ground?—Not exactly; but sometimes they do.

61,221. Then the shrimp trawlers must occasionally take considerable quantities of fish of other kinds?—The shrimp trawlers?

61,222. Yes.—They catch small fish in the nets at times as well as shrimps. If they catch any big ones along with them they save the big ones, but they throw the small ones away.

61,223. Are the small fish they throw overboard alive?—Yes, they put them overboard directly.

61,224. Are they any the worse for having been taken up?—Some of them will die; there is no doubt of that. No matter what kind of net is put into the sea, it will catch and destroy some small fish.

61,225. Do you know whether the trawlers complain of the destruction of small fish by the shrimpers?—I have not heard anyone complain of it.

61,226. They do not say that the shrimpers kill the small fish they take up in this way?—I have not heard them say so.

61,227. Have you heard no complaint?—No.

61,228. What is the extent of your jurisdiction; what is the distance over which your jurisdiction extends east and west?—Well, I do not know, but about six miles, I think.

61,229. Do you think there are as many boats belonging to the south of the Thames as to Leigh in your jurisdiction?—To the south side?

61,230. Yes.—No, there are hardly any that ever work in my jurisdiction.

61,231. Are there none from Gravesend?—They come down sometimes; but they are principally up the river.

61,232. Not on the ground within your jurisdiction?—Sometimes they come there.

61,233. (*Professor Huxley.*) Do the 114 boats you spoke of work constantly over one space?—No.

61,234. Do they stretch out beyond your jurisdiction?—Yes, for many miles.

61,235. How many miles will they go away from Leigh?—They go down to Redstone sometimes, and nearly down to Sheerness.

61,236. Is there a shrimping ground all that way?—Yes.

61,237. Can you give us any sort of notion of the number of miles over which these 114 Leigh boats fish? How many miles up and down the river, on the average, do they fish?—I cannot tell.

61,238. They are obliged to get their fishing near the shore in consequence of being obliged to get back soon?—They do get back if they can; but sometimes they stop out all night. They do not always go home the same day.

61,239. How far down the river will be the furthest that they stretch?—I have known them to be nearly down to Herne Bay.

61,240. Not further than that?—No, not shrimping.

61,241. How many miles is that from Leigh?—I am sure I do not know, but I should say about 18 or 20 miles.

61,242. Then it is within a limited area that these 114 boats work?—Yes.

61,243-4. They do not work over any great space?—No.

61,245. How far up the river will they go from Leigh?—Some of them as high up as Gravesend; but it is not right for them to go there.

61,246. Why not?—Up to Hope Point is where I have told them, but I know they have gone higher.

61,247. Is there any rule to prevent them from going higher?—I do not know that there is any rule, but I have been told not to let them go higher than Hope Point.

61,248. What is the motive for that?—I do not know.

61,249. Do these people on the whole fish over 35 miles of the length of the river?—They fish up as high as Hope Point, and from there nearly to Herne Bay or thereabouts.

61,250. That would be about 35 miles?—Yes.

61,251. (*Mr. Lefevre.*) Is there any whitebait fishing at Leigh?—No.

61,252. How far down the river does the whitebait fishing extend?—I do not know.

61,253. You know nothing about it?—No.

61,254. (*Professor Huxley.*) Have you heard any complaint on the part of the trawlers of the fish falling off since you have known the river?—No.

61,255. Yet they fish over the ground the shrimp men work over?—Yes.

61,256. All over the same general space?—Not exactly.

61,257. But over the same region of the river?—The shrimpers shrimp sometimes in one part of the river and sometimes in another, whereas the trawlers go from the lighthouse down to deep water. Very often they do not shrimp there at all. The shrimps lie more upon the shoal ground; therefore the shrimpers take the shore more than the trawlers.

61,258-9. From what you tell us it appears clear that the shrimpers have not, so far as you know, affected the supply of other fish in any way?—I never heard that they did or found out that they did. There were as many fish last year obtained at Leigh as ever the oldest man can remember.

61,260. What kind of fish?—Such fish as dabs, plaice, and flounders.

61,261. (*Mr. Lefevre.*) Were there any soles?—Not many soles.

61,262. They were mainly dabs and flounders?—Yes; there are not many soles about our place.

61,263. (*Professor Huxley.*) Were there ever many soles there?—I never knew many.

61,264. What is the condition of the water about there?—It is quite salt.

61,265. Thoroughly salt?—Yes.

61,266. How long is the shrimp-trawl allowed to be down at a time?—That depends upon circumstances.

61,267. How long is the longest time it will be down?—Sometimes they have it down for an hour and a half.

61,268. Not more than that?—No, and sometimes not more than 10 minutes; very often as soon as they get it down they have to get it up again.

61,269. (*Mr. Lefevre.*) What is the spratting season in the Thames? Do they come up as far as Leigh?—Yes, sometimes.

61,270. Do the fishermen during the spratting season devote themselves to it?—Yes, I believe there are 11 or 12 boats that do.

61,271. Do they fish with a stow-net?—Yes.

61,272. There are only about 12 of them?—I believe that is all.

61,273. (*Professor Huxley.*) Do the stow-net people catch small fish of other kinds in their nets?—Yes.

61,274. Do they catch small flounders and small fish of any kind?—Yes.

61,275. Is there any other matter we have not mentioned that you would like to bring before us?—No, I do not know of anything. I think you have asked me all I know about the Thames.

61,276. (*Mr. Lefevre.*) Do the Conservators issue any regulation with regard to the size of the nets, or

do they leave the matter within your discretion ?—I have a book of byelaws.

61,277. Is the size of the nets mentioned in the byelaws ?—Yes.

61,278. And the size of the nets varies according to the different kinds of fishing ?—Yes.

61,279. Is there a regulated size with regard to the shrimpers ?—I never knew of any.

61,280. Are they allowed to use what nets they like ?—I never found any laid down for shrimp-nets or stow-boat nets.

61,281. Is there a regulation with regard to the size of the shrimp-nets laid down by the shrimpers themselves. Is the size of the shrimps to be taken enforced by the Conservators ?—I do not believe there is any regular size for the shrimps at all, but any person can see whether they are taking brood or shrimps fit for the market.

61,282. Then their not taking small shrimps is a rule observed by the fishermen themselves, and not one laid down by the Conservators. Is that so ?—I do not know what you mean.

61,283. You say the shrimpers observe a regulation as to the size of the fish they bring ashore ?—Yes.

61,284. Is that a rule laid down by the Conservators ?—Yes ; but it was always the practice of Mr. Green, my predecessor, and it has always been my own, to go on board the boats whenever it was possible, and see that they did not bring brood ashore. They have a gauge through which they sift them, and generally they only bring ashore those that are fit for the market, but there are a few who want a good deal of looking after.

61,285. Is the regulation of the Conservators simply that no brood or small fish shall be brought ashore, or is there any regulated size as to the shrimps ?—I do not know that any size is mentioned in my instructions with regard to the length of the shrimps.

61,286. How was the sieve regulated. Was it by the men themselves or by the Conservancy Board ?—There have been shrimp-sieves as long as I can remember.

61,287. Is there any demand for small shrimps for potting ?—I do not know that any person sends any from Leigh now, but they did some years ago.

61,288. Is it now prohibited altogether ?—I do not know of any being sold for potting except what a man named Hayes buys regularly in the market.

61,289. What market ?—Billingsgate.

61,290. Then there is a quantity of small shrimps sent to Billingsgate ?—No, the small shrimps got in that way are picked out from the large ones ; they are not sent specially.

The witness withdrew.

JOHN SMITH called and examined.

J. Smith.

61,291. (*Mr. Lefevre.*) I believe you are the owner of some oyster fisheries in the Burnham river ?—Yes.

61,292. You were unable to attend our meeting the other day at Brightlingsea ?—Yes, I did not know of it.

61,293. You are anxious, I believe, to give us some evidence arising out of that meeting ?—Yes, I think there are a few facts which you ought to know in reference to the manner of taking the brood from the free ground.

61,294. Is your ground at the mouth of the Burnham river ?—I have oyster grounds in the River Crouch. I have also some near the village of Burnham, some four miles up the river, and some 10 miles from Burnham.

61,295. Between these grounds is there ground open to the public ?—No, not there, but if you will consult the map you will find a piece of ground leading from the River Crouch down to a village called Paglesham.

61,296. Is that the free ground ?—Yes.

61,297. What is the extent of that ground ?—About four miles.

61,298. It is in reference to that free ground that you wish to give us some information ?—Yes, in reference to taking young spat or spawn from it. My idea is that the present method of taking young spat or spawn is destructive to the production of oysters, from the fact that the taking away of the parent oyster prevents the reproduction.

61,299. Is that ground fished to a considerable extent by the oyster dredgers in that neighbourhood ?—There is a great amount of oyster dredging on the part of dredgers employed by private owners. The beds in the River Crouch are private beds belonging to Sir Henry Mildmay, and let to a company, but the great majority of dredgers employed are employed by private owners.

61,300. When there is any spat on the ground are they all sent to dredge that open ground ?—Yes.

61,301. Then do you think it would be of advantage if that ground were converted into private beds ?—I believe it would be much more productive as the season requires that we must work in order to be prepared for the spawn from the present time until Midsummer. If the beds are not worked it causes an accumulation of silt and mud upon the beds, and the difficulty is to get men to work when they cannot get remuneration for their labour. Of course they do not care to work under such circumstances, and the consequence is that the public ground is not properly cleaned for the reception of the spat.

61,302. In a good season for spat does the dredging take place all the year round upon that open ground or only during a particular portion of the year ?—In a good season dredging would continue to some extent all the year round.

61,303. Would that not be sufficient to clean the bed of the river ?—Yes, but generally they do not work in the spring season of the year.

61,304. What are the regulations you observe yourself on your private grounds with regard to dredging ? Do you dredge all the year round to clean the bed of the river ?—We dredge in the winter months to protect the ground from vermin, and to clear away the freshets. At that time there is a great deal of fresh water coming from both sides of the river, and it is necessary to keep the ground clean in order to keep the young brood on the top of the beds, and to prevent the silt from smothering it. In the spring of the year we continue to work the ground for the reception of spawn.

61,305. During what period of the year is there no dredging going on over the ground ?—The plan I adopt is to leave it from Midsummer to Michaelmas for two or three months.

61,306. On what ground do you leave off dredging ?—On the brood ground. The producing ground.

61,307. Is that in order that the young brood shall not be injured by dredging ?—Yes.

61,308. You think that during two or three months of the autumn it is desirable there should be no dredging ?—Rather in two or three months of the summer between Midsummer and Michaelmas quarters.

61,309. Have you observed that you often get spat on your own ground when there has been none to be found on the open ground you have been speaking of ?—Yes, I have observed that.

61,310. Have you had good spat on your own ground for the last two or three years ?—I have had some spat but not an abundant spat.

61,311. Have you had any good spat since 1858 ?—No.

61,312. Have you observed any spat on the open ground since 1858 ?—Only very little.

61,313. During the last two or three years has there been any at all ?—Very little.

61,314. Do you think that if this open ground had

LONDON.

J. Smith.

25 March 1865.

been in point of fact private ground like your own there would have been spat on it?—I have no doubt that there would have been more than there has been.

61,315. Do you think it would be of any advantage to the open ground if during the same two months of the summer in which you leave off dredging your own ground there should be no dredging on that ground?—I do.

61,316. On the ground that the small brood might be injured by dredging?—Yes, but I think there would be a greater advantage in allowing a certain proportion of the old stock to remain on the ground.

61,317. Do you think the ground has been so completely cleared by dredging for spat that there are not sufficient parent oysters left on the ground?—Yes, exactly so.

61,318. (*Professor Huxley.*) That is what you mean by saying the mode of taking spat has been injurious?—Yes.

61,319. (*Mr. Lefevre.*) The open ground you spoke of is in the Roach River?—Yes.

61,320. Are there private beds immediately above that?—Yes.

61,321. We have been told that the spat in the private beds will float down from the upper beds and settle on the public beds?—It may be so, but I do not think it is capable of proof.

61,322. The same might be said in regard to the spat from the free ground to the private ground?—Yes.

61,323. The soil is all of the same character?—Yes.

61,324. Do you not think the upper ground is sufficient to stock the open ground as well as the private ground?—No I do not.

61,325. Do you think it is possible so completely to dredge the bottom of the river as not to leave a sufficient number of oysters for breeding?—I do certainly. I do not mean to say that there would not be any spawn deposited, but the supply would be very different from what it would be if the ground were properly cultivated.

61,326. Do your remarks relate only to the open ground in the Roach River, or to the open ground generally on the coast of Essex?—My remarks apply to a river called Pont, and to the Blackwater River also.

61,327. What is the size of the open ground in the Blackwater River; what is the length of it?—I do not know but I think about nine miles.

61,328–32. Are there any private grounds in the Blackwater River?—No, not in the Blackwater River, but there are just off it—off Mersea Island.

61,333. You are aware that there would be considerable difficulty in converting into a private ground grounds which have been extensively fished by the public?—Yes, I see that difficulty.

61,334. Supposing that such grounds were still left open to the public generally do you think that by the adoption of any regulation the fishing might be improved?—Yes I think it might.

61,335. What regulation would you propose?—I would compel the men to cull the oysters and only take those that are of a certain size.

61,336. You would not allow brood below a certain size to be taken?—No.

61,337. For what reason?—On the ground of reproduction.

61,338. To what size would you limit them?—Nothing ought to be taken less than two years of age.

61,339. Do you think that the oyster breeds within two years?—Yes, I believe it does.

61,340. Is it on the ground that it would supply a certain amount of spawn that you would leave the oysters until they were two years old?—Yes.

61,341. It would be possible to clear away the brood beyond two years old just as completely as to clear it away below that age would it not?—Yes, but you would still have the stock up to two years old remaining.

61,342. And you think that it would supply spawn for the beds?—Yes; but it would be impossible to clear away all the old ones.

61,343. You think there would always be a few?—Yes.

61,344. Even if there were only very few on the ground?—Yes.

61,345–6. But you told us you thought that the old oysters would not be sufficient to supply the brood?—I do not think they would. Will you allow me to show you a few specimens?

61,347. (*Professor Huxley.*) What age do you consider the smallest of those oysters to be?—That is one year old, or rather would be one year old next June.

61,348. The diameter of the shell, measuring it longways, is an inch and a half?—Yes.

61,349. Do you judge the age by the diameter of the shell?—No, we can tell by the appearance.

61,350. The thickness of the shell?—No, the general form of it. Here is one of the same age although it is a little larger.

61,351. On what ground do you consider that to be of the same age; is it the delicacy of the shell?—It is from the thinness of the oyster, not the thinness of the shell, but of the oyster itself.

61,352. The thinness of the oyster from one shell to the other?—Yes.

61,353. Is that a mark you can always judge by?—Yes; but that one is considerably older, although it is of the same diameter.

61,354. What age do you say this is?—Three years.

61,355. Three years?—Yes, I believe that to be three years old.

61,356. And this one you say is not more than one year old?—Yes, it is not more than one year old.

61,357. In point of fact, the one-year old oyster in this case is rather larger than the other, but it is not above two-thirds as thick?—Yes.

61,358. Do you think that an oyster of this size ever breeds?—No.

61,359. What do you consider to be the smallest size that do breed?—I do not think it depends upon the size; it rather depends upon the age.

61,360. But you judge of the age to a certain extent by the thickness?—Yes.

61,361. What is the smallest thickness of oyster that breeds?—I cannot speak as to that, but I think that an oyster of two years old will breed.

61,362. You form your judgment of the age by the thickness?—Yes.

61,363. Therefore there must be a certain thickness?—Yes, five-eighths of an inch. I should think say from half an inch to five-eighths.

61,364. Then none of the ordinary gauges for measuring oysters would be of any use in preventing oysters fit to breed from passing through?—It would depend upon the ground from which they come. Some grounds produce oysters much larger than others of the same age.

61,365. Then would you require a different gauge for different grounds?—Yes, I think so.

61,366. Then what you say now has special reference to your particular ground at Burnham?—Yes.

61,367. And what would you fix the minimum size at, because the judgment of the age depends on the thickness?—I think if they would not take smaller than that (*exhibiting an oyster*) the quantity would be much larger.

61,368. This oyster is two inches measured the longest way, and half an inch thick as nearly as possible?—Yes.

61,369. Then you think that the oysters under half an inch in thickness ought to be left, and not taken?—Yes.

61,370. On the ground that when they are larger than that they are fit to breed?—Yes. I am not speaking of the free rights, or anything of that sort, but merely of production for the benefit of the public.

61,371. Are the brood beds at Burnham artificial, or are they supplied naturally?—They are supplied naturally.

61,372. You simply prepare the ground, and let the spat drop upon it ?—Yes.

61,373–4. How do you prepare the ground ?—We dredge it in the spring ; we clean the culsh, and get fresh culsh, and lay it down upon the beds.

61,375. Where do you get it from ?—From all places in the Blackwater where we can get it from without any injury to the fishery. It is washed up from the banks.

61,376. Is it a kind of gravel ?—No, this is what we call culsh.

61,377. Old oyster-shells ?—Yes, you will notice two spat upon that.

61,378. Do you think oyster-shells better than anything else ?—Yes, we cannot get anything better.

61,379. Have you thought of adopting the French plan of laying down tiles and broken pottery for collecting spat ?—No, but we adopt the plan of oyster beds or pits, where we stock the oysters in the winter. We close them up with water, about half full, and lay down a number of young oysters. Last year I had some 20 of these pits, 60 feet long and 30 feet wide. I had them formed privately to make an experiment, but they entirely failed. I got no spat. I attribute the result to this, that in still water there will always be a little settlement. If you lay down a clean shell to-day, you will find a slight settlement on it to-morrow, and that will be injurious to the spawn, if it is allowed to accumulate.

61,380. Did the oysters live, and do well in the beds ?—Yes ; when we took them out again there might be one in a hundred dead.

61,381. Were they there all the summer ?—Yes.

61,382. Did they spawn ?—I have no doubt of it.

61,383. Did you open them to see if they contained brood ?—Yes, they were black-sick just before they shot the spawn. I was particular in putting them in at the right time, and in preparing the bottom of my beds.

61,384. You are aware that the oysters leave the shells of the parent oysters at a certain stage of their development ?—Yes.

61,385. Is it not possible that the oyster brood may have drifted away altogether ?—Not out of these ponds, because they were banked up with earth all round.

61,386. Was there any running water through them ?—There was no tidal way.

61,387. It was all still water ?—Yes.

61,388. Under those circumstances is it not possible that the brood could not live in consequence of not being sufficiently ærated, and that it suffered from the want of a tidal way ? —It is certain that where you have a tidal way it is better for them.

61,389. They came to nothing at all ?—No.

61,390–2. How many years is it that the practice of preparing beds for receiving the spat naturally has been carried on at Burnham ?—I can hardly say.

61,393. For the last 20 or 30 years ?—Yes, ever since I have been born.

61,394. That is to say, that the mode of preparing a certain space of ground by laying down culch has been carried on there as long as you can remember ? —Yes.

61,395. And you trust to the drift of the tide for bringing spat there ?—Yes.

61,396. Has that plan been practised there from time immemorial ?—Yes.

61,397. Have you ever found any advantage in using artificial means to receive the spat like tiles, or twigs, or fascines, or anything of that kind ?—No, we have used nothing but ordinary culch.

61,398. You are aware that artificial means have been resorted to largely in France ?—Yes, and to some extent also in England.

61,399. Have you thought it worth your while to try the same experiment ?—No.

61,400. You think that the ordinary culch is better? —Yes, but where there are many parent oysters there is more spat.

61,401. Have you any record of how long this mode of preparing beds for receiving spat has been carried on at Burnham ?—It may be said to have been done for centuries ; ever since the system of dredging oysters was adopted.

61,402–3. Was it carried on in your father's time, if your father happened to be employed in the oyster fishery ?—Yes.

61,404. (*Mr. Lefevre.*) Do you separate your beds for fattening and breeding, or are the oysters laid indiscriminately upon both ?—We have certain pits which we call oyster pits where we lay down oysters for the next year's market.

61,405. And you have separate beds for breeding ? —Yes. Still we get spat on the oyster ground where the stock of oysters has been laid for the next year's market. We find spat on those beds.

61,406. (*Professor Huxley.*) I suppose that in making a brood bed you must be guided very much by the drift of the tide ?—Yes, the tide is a very essential thing. We want a good tide to go over the ground. If we get into eddies we get a disappointment.

61,407. In what depth of water do you have your brood laid down ?—I do not think that that is an important point so long as we get a good tide.

61,408. You must not have the bed laid bare at low water ?—It is at spring tides. The part of the ground between low water neap tides and low water spring tides is very good ground for producing oysters.

61,409. That is only a ground that is laid bare once in the course of a month or so ?—It is bare every fortnight at every spring-tide, but not for long.

61,410. Only between tide marks ?—Yes.

61,411. (*Mr. Lefevre.*) At what age do you remove brood from the breeding to the fattening beds ?— We remove them so that they should be fit for the market next season. Some may be three years old, and some four.

61,412. So that the oysters are from four to five years old when they go to the market ?—Yes.

61,413. Do you only remove oysters of a certain size from the breeding ground to the other beds ?— Yes, we remove oysters of a certain size and age ; but they are of the same age frequently, although not of the same size.

61,414. Do you also leave any older oysters on the breeding beds ?—There will be a few left. All we get in the dredge we cull. We do not designedly leave a large stock of old oysters ; that is to say, oysters more than three years old.

61,415. Do you think that the spat on the breeding beds is the produce of the older or the younger oysters ?—The spat of all of them comes from oysters about three years old.

61,416. Do you think that the spat on your beds is the produce of oysters on your own ground, or has it been drifted down from the higher parts of the river ? —I have no doubt it is mainly from the spat on the ground, but not altogether.

61,417. Have you ever found that you have spat on your ground when the private beds higher up have none ?—I have. Last year was a very scarce year of spat, but I fortunately obtained some.

61,418. Do you find that you have spat in the lower part of the river when the ground in the upper part has none ?—My grounds are situated in three separate parts of the river.

61,419. But have you sometimes had spat on the lower grounds when you have not had it on the upper grounds ?—That has been the case occasionally, but it is not always alike.

61,420. Do you think that that occurs in consequence of the spat from the upper part of the grounds drifting down upon your lower grounds, while the spat from the lower grounds goes off on to some other part still lower ?—It may be from that cause.

61,421. You cannot form any conclusion from the observations you have personally made on the subject ?—No, but the more stock there is in the river

LONDON.

J. Smith.

25 March 1865.

the more likely we are to have spat whether upon the private or the public beds.

61,422. (*Professor Huxley.*) Have you ever found it worth while to lay down breeding stock and take the chance of getting spat?—I do that.

61,423–4. Will you describe how you do it a little in detail?—Well, suppose, in the first instance, that we had a severe winter, and that the freshets and frost killed all the stock on the ground, my object in the spring of the year would be to clean that ground thoroughly, and then to lay down some large oysters obtained from some other place. If I could get them I should deposit them upon my beds.

61,425. Do you care where you get them?—Of course I prefer native oysters.

61,426. But suppose that you got coarse sea oysters, could you make anything of their brood by your mode of culture?—I should prefer the others; I do not like sea oysters at all.

61,427. Then you would lay down those large oysters you obtained in that way upon your breeding ground?—Yes; that is supposing that by any means there were no oysters left upon my ground.

61,428. Would you lay them down in that case absolutely upon the breeding ground?—Yes.

61,429. Then you would not be afraid of the brood drifting away to the free ground?—No, but that might be so.

61,430. Have you ever tried the experiment you are now describing?—Yes.

61,431. Have you had frequent occasion to try it?—I have tried it in more years than one.

61,432. And have you found it answer?—Yes.

61,433. So that although a portion of the brood may drift away enough will remain to make it worth your while to take all that trouble?—Yes; but I do not mean to say that the experiment is always attended by the like results.

61,434. But on the whole it is worth doing?—I have no doubt at all that it is satisfactory.

61,435. (*Mr. Lefevre.*) What sized oysters would you lay down?—Do you mean for procreation.

61,436. Yes.—Oysters of from three to four and five years of age.

61,437. Would you lay down oysters as small as two inches across?—I should prefer them larger.

61,438. Would you lay down any as young as two years old?—I should do so if I could not get them larger.

61,439. But if you could get them larger you would not lay them down of that age?—I should prefer larger oysters.

61,440. On the ground that the larger oysters produce more spawn?—Yes.

61,441. You do not think that small two-year old oysters produce any great quantity of spawn?—Certainly not so much as the larger oysters.

61,442. What quantity of oysters do you lay down on the beds with reference to the size of the beds? For instance, take the case you have supposed where a bed is free from any oysters whatever, what number of oysters would you lay down in proportion to the size of the bed for breeding purposes?—I should lay down about 20 tubs to the acre.

61,443. (*Professor Huxley.*) There being how many oysters in a tub?—That depends on the size. Sometimes there are 1,600, and sometimes 2,200. You must recollect that I am now speaking of native oysters.

61,444. What would be the average number in a tub?—In the London market from 1,600 to 2,000; and in the foreign market 2,200.

61,445. Then we may call it 2,000?—Yes, that would be about the average.

61,446. And how many tubs do you lay down to the acre?—I consider that 20 tubs are sufficient.

61,447. That would be 40,000 oysters?—Yes.

61,448. That would be as nearly as may be an oyster to every square foot?—That may be so, but I am not aware of it. It has been said that an oyster will stock a very large space, but that has not been borne out by my experience.

61,449. Do you lay down the oysters indiscriminately?—They spread them out of the boat, I believe.

61,450. (*Mr. Lefevre.*) Do you think there may be so many oysters on the ground and yet that it would be hardly worth while to dredge over it?—No, I do not. It would always answer to dredge if persons had liberty to dredge there when the oysters were of a proper age to take.

61,451. Is it possible so to dredge a public bed as really to leave no oysters at all there; that is to say, none of the parent oysters?—I do not think it would be possible to get the last oyster.

61,452. Yet it might be possible to dredge the ground so completely as not to leave enough oysters for breeding purposes?—Yes.

61,453. Are your beds your own property, or do you hire them?—One is my own property, and two I hire.

61,454. Can you give us any notion of the value of the beds. What rent do you pay for them?—That depends upon the quality of the ground.

61,455. Take the best ground you have in the Burnham River. Do you rent it by the acre?—No, it is generally so much for the property irrespective of its area.

61,456. Do you pay a very high rent?—I pay a much larger rent than I did formerly.

61,457. There is a bill before Parliament now, is there not, for converting this public ground in the Roach River into private ground?—Yes, there is.

61,458. Do you know whether it is proposed to charge any rent for it?—I believe it will be hired of the Woods and Forests.

61,459. Do you know whether it is proposed to put it up for public bidding, or is it some company that proposes to appropriate it and pay rent?—It is to be taken by a company.

61,460. (*Professor Huxley.*) Do you find that attempts are ever made to plunder your private beds, and do you find any difficulty in protecting them?—I employ watchmen. Do you refer to my own private beds, or to the beds generally?

61,461. To your own beds?—I do not make any special provision when I have my oyster stocks on the beds. I have men who are working there all the week, and on the Saturday night I leave a man there, and also a man all day on Sunday. I believe that one man takes his turn one week, and another another.

61,462. You have watchers?—Yes.

61,463. If that were not done would attempts be made to rob you?—I have no doubt of it.

61,464. Just as in the case of an orchard or any other private property?—Yes, I believe that the Burnham Oyster Company incur great expense in that respect. They have what they term a rural police.

61,465. Do you think there is any greater difficulty in protecting oyster property than there is in protecting other property?—Yes.

61,466. Why so?—Because it is so difficult to identify the offenders.

61,467. The attempts to plunder are made principally in the night-time, I presume?—Yes, I think so, generally.

61,468. During the daytime it would be very easy to see a man dredging upon the ground?—Yes, but it would not be easy to tell exactly whether he was within or without the boundary.

61,469. (*Mr. Lefevre.*) What is the nature of your remedy if you found a man dredging upon your ground? Have there been any prosecutions?—Yes, there have been many cases of prosecution at Burnham, but the difficulty is to prove that the man was dredging on the ground.

61,470. Do you prosecute them for trespassing upon the ground, or for taking your property?—We prosecute them for felony.

61,471. But supposing a man is dredging up spat,

is it considered that you have a property in that?—Yes, certainly, on the private grounds.

61,472. (*Professor Huxley.*) But if a man were merely dredging and you found no oysters in his dredge?—He has no right to heave a dredge over.

61,473. But you could not prosecute him for felony for heaving a dredge over?—If he pulled up anything then we should.

61,474. Would you not have to prosecute him for trespass?—Perhaps so; but there is a clause in the Act which provides for that, and says he may be prosecuted for disturbing private beds.

61,475. Is that a special Act?—No; it is a general Act. It is the statute law, I believe.

61,476. What redress have you if dredger-men go over your beds conceiving they have public rights?—If the Roach River were made private property there would only be private rights.

61,477. But I understand from you that those grounds are the property of the Crown?—Yes.

61,478. Then is there an Act of Parliament required to secure that property for the Crown?—That is a question.

61,479. On the plea of attempting to exercise a public right have the dredger-men committed depredations upon private property?—There has been a large number of oysters taken away from certain grounds.

61,480. Do you think under the present state of the law sufficient protection is given to the owners of private beds as against the public claiming a supposed right of fishery there?—I am not sufficiently acquainted with the law to understand how to answer that question. All I know is that we are put to considerable expense in protecting our property.

61,481. Have you, as the owner of private beds, found any difficulty in maintaining your rights and keeping the public out?—No; oysters have been stolen from me, and I have been unable from want of sufficient evidence to convict the offenders, but that has generally arisen from the want of proof of identity.

61,482. But where you have had evidence have you found any difficulty under the law as it stands?—No.

61,483–5. Have you known of any case in which such a difficulty has arisen?—No.

61,486. Have you had one watchman for each of your grounds?—Yes.

61,487. And, so far, you have found one sufficient?—Yes.

61,488. (*Mr. Lefevre.*) Are you not one of the promoters of the new company for appropriating this public ground and converting it into a private ground?—Yes.

61,489. Can you tell us what is the rent proposed, or rather, is there any rent mentioned in the bill for this ground?—Yes, there is.

61,490. What is the rent you propose to pay?—115*l.* a-year.

61,491. For how great an extent of the river?—The ground is four miles in extent.

61,492. What is the breadth of the river?—I cannot tell exactly; but it is narrow.

61,493. There have been two or three of those bills before Parliament for converting public into private grounds?—Yes.

61,494. Do you think that there is a considerable extent of open ground in the rivers on the Essex coast that might be converted into private grounds?—There is in the River Roach.

61,495. But not in the other rivers?—There is ground that might be converted in the other rivers.

61,496. Ground that you think might be properly converted into private ground?—Yes, in the Roach River.

61,497. Only in the Roach River?—I only speak of the Roach.

61,498. Considering the fact that these public grounds have been fished by the public from time immemorial, might there not be a fairer mode of meeting the question than converting them into private grounds?—There might be.

61,499. What regulation could be carried out on these open grounds so as to give them the same advantages as are possessed by private grounds?—There might be a regulation as to the size of the oyster that is to be taken. They should be required to cull the oysters.

61,500. Would you also impose any limit as to the time of dredging?—I think I have already answered that question in reference to the months during which dredging should not be carried on.

61,501. You think there ought to be two months of close-time?—Yes.

61,502. In what two months would you prohibit dredging?—July and August.

61,503. Do you think that these regulations would be sufficient?—I have no doubt that they would tend to increase the supply of oysters.

61,504. Would the same advantage be obtained by the public generally with regard to the supply of oysters by the imposition of regulations of that sort as by converting the public beds into private beds?—Yes, I think so.

The witness withdrew.

Captain George Austin called and examined.

61,505–8. (*Professor Huxley.*) You are engaged, I believe, Mr. Austin, in the oyster business at Whitstable?—Yes, and I wish to make a few observations to you upon that subject. Some years ago, before M. Coste published his experiments, I was engaged for some time in making experiments both on the coast of Kent and in Ireland. I knew that if I could produce the brood of oysters by artificial means, it would be worth to me a sum of 10,000*l.* or 20,000*l.* and I naturally paid great attention to the subject. I do not wish to trouble you with anything as to the mode in which the oysters breed, because you know how that is done, and all that kind of thing, as well as I could tell you, but I think my best course will be to give you as clearly as I can the results of the experiments which I have made. I wish to show you also what those experiments prove, and I shall lay before you such facts as will, I think, prove the truth of what I am about to say. In the first place, with regard to the brood, you are aware that the oyster in the first place, before emitting its spat, becomes what the fishermen call "white sick." That is the egg when it is first matured, and when it is quite white. Afterwards the oyster becomes what is called "black sick," and the spat is then ready to go out of the mouth of the oyster. As far as I have inquired into the subject, I find that the oyster always breeds. That is invariably the case, whatever the weather may be—whether it is cold, dry, or stormy, or anything else. During the season the oyster invariably breeds.

61,509. Is the period of breeding delayed or retarded by the temperature of the water?—Very slightly. I never noticed a difference of more than a week or ten days, but some of the oysters, as Mr. Smith has already told you, spat as late as the end of September. The general time of spatting, however, is much earlier.

61,510. Does your remark apply to oysters in the same depth of water—to oysters in deep water as well as in shallow water?—I think there is no difference. As far as the microscope enables one to observe, the oysters are from about six to eight weeks propagating. The spawn, or spat, of the oyster is never emitted when the water is in a state of commotion, and it may be detained for several days after it has arrived at maturity and is quite ready to be emitted. The parent oyster keeps the shell closed and thus detains it. When the weather is at all rough

LONDON.

Capt. G. Austin.

25 March 1865.

the oyster will sink down in the water and stand upright with its mouth partly open. That is one source of the injury done to the brood, namely the rough weather.

61,511. In what way is it injured?—The brood die in the mouth of the oyster. I have proved that by means of observations with the microscope. I have taken oysters from the ground, in a spawning state, and placed them under the microscope, and I have found that portion of the spat which has been less matured quite lively, while all the rest of the brood were evidently dead or dying. They were so far injured, that when they were put into water they could not swim. The spawn comes to maturity by degrees.

61,512. Have you found, when you have examined them under the microscope, that those which were unable to move in the way which you have described had more shell than the rest?—Yes; the shell was both darker and thicker.

61,513. Those which were not able to swim about had more shell?—Yes, they had more shell. The darker colour of the spat shows, I think, the greater maturity. The colour in fact is occasioned by the shell.

61,514. You know the ciliated *vela*?—Yes.

61,515. Those that are able to swim are provided with those appendages; but I presume that those which cannot swim show no trace of them?—You see them with cilia under the shell.

61,516. Upon those that are active?—Upon those which have been confined too long in the shell of the parent oyster. If you put the others in a drop of water they will swim about at once.

61,517. Do you think that that is because those which are less active have really been injured by the retention, or is it simply that in the course of development they have begun to lose the ciliated *vela*?—I think they are something like May-flies. They have just a certain time to come to maturity, and unless they emerge at that particular time they die. I have seen them when the oyster has been fit and ready to spawn. You will see the oysters lying quietly, and a little stream issuing forth, rising and falling in succession.

61,518. Passing through the valves of the shell?—Yes, and the spawn rising and swimming about.

61,519–20. You know that in the living oyster there is a current or stream passing out from the branchial aperture?—Yes.

61,521. The young oysters float in that stream?—Yes, and they come out in succession and circulate about; but I never observed them rise to the surface.

61,522. Still they swim about?—Yes. As regards the duration of life in the young oyster, I believe that it attaches itself as soon as possible, that is, as soon as it meets with a proper object.

61,523. You are not of opinion that it remains for some time without attaching itself?—No.

61,524. We have had evidence brought before us to show that the young fry keep floating about in a free ciliated condition for three weeks?—I am coming to that question. It does not live long, as far as I have been able to ascertain. I have never been able to keep it more than 10 or 12 hours in its best condition. I have kept it in fresh water alive as long as that, but I have not been able to keep it alive in a bottle for more than four or five hours. I believe it is an error that it lives anything like approaching the time you have mentioned. Indeed the growth of the shell would become too heavy for the swimming apparatus, and would prevent it from keeping afloat. In the next place I believe that many persons have been deceived by the continuous succession. In one of my experiments I caused a boat to be sunk and placed spawning oysters in it. If I dipped a wine glass into the water at any hour of the day I always found some spawn there; but the question was when were they born? Were they born then or some hours before? I have never been able to keep any of the spat alive in a vessel for more than four or five hours. I have observed that its vitality and activity continually decrease until at last it will only move slightly upon being shaken up.

61,525. Did you use, in those experiments, a vessel through which renewed water was continually passing?—When it has been in a large bottle, I have poured off the water on the top, and added fresh water, and in an aquarium I have had a stream of fresh water passing continually through.

61,526. Did you find that the result was the same in the aquarium, and that they did not live there?—Yes, they did not live longer than 12 hours. I proved that by having the aquarium filled with nice cool water, and placing the oyster at once into the aquarium. After the oyster had been in about four hours it began slowly to open its mouth, and the birth began to take place. Sometimes the process of emitting the spat lasted for an hour and a half, and sometimes only for half an hour. I suppose it depended upon the amount of spawn that was sufficiently matured and ready to come forth. When you were at Whitstable, you asked some questions as to the absence of spat upon the beds in certain years. I can give you the result of my experience, and how it bears upon the matter. The necessary conditions for having a good spat of brood are, in the first place, quiet weather and clear water. That was proved in this way. First of all, by the gales of wind which have occurred off the shore at the spatting time. The winds that have visited our shores have caused the washing down of deposits from the muddy coast, so that all around the water of the Thames has of late years gradually got worse and worse. Sometimes it is quite of the colour of chocolate, but if you fill a wine glass with it, all the impurities will be deposited at the bottom of the glass. Now, that dirty, cloudy stuff, in my opinion, hampers the swimming-apparatus of the young oyster, and causes the brood to fall in places where it cannot attach itself, and where it dies. That that also has the effect of stopping the oysters from spawning I have proved in this way: by experiments with an aquarium, and by sinking a boat. First of all, I had an aquarium put down close to the shore, and I had a constant succession of cool water passed through by means of an apparatus above. I kept the aquarium in a cool shady spot, and let the water flow to the surface. In the next place, in order to test the different conditions, I had a large boat sunk very near the flat-shore, where the tide came through at every change of the tide, and left the boat with a certain amount of water in it when the tide went down. As soon as it flowed again it went through the boat, and thus kept up a continuous supply of fresh water. That was done to imitate the action of a pool along the shore. During that time the oysters had ceased spawning, and had buried themselves and got down under the mud. The oysters outside did not spawn, but those in the aquarium kept continuously spawning, and so did those in the boat. There was no cessation at all, as far as I could ascertain, but outside there was, although the oysters were lying thick upon the ground. If there had been any spawn I must have got some, because it comes out in such myriads. That proves, I think, that the oysters do close their shells, and that that is one reason why we lose the spat. That the oysters are able to move is a fact well known, because you will always find that if you throw out oysters upon the grounds one day, and examine them, you will find them lying with the wrong side up; but if you examine them on the following day, you will find that they have all turned over.

61,527. They turn over so as to bring the convex shell upwards?—Yes, and they must do that in consequence of possessing some means of locomotion or other. Then again when on shore you will occasionally see them emit a spurt of water which is followed by a slight movement of the oyster. Then again that they do bury themselves is perfectly certain. For instance at Whitstable and on the flats all down along Herne Bay the sailors can predict an east wind, which is the most violent wind we get,

by the simple fact that they cannot catch oysters. The men will go out for instance to-day, when there is an east wind coming on, and they will catch nothing at all. It will take them six hours to catch what they call their stint, and very hard work it will be for them too. As soon as the east wind is gone they will go on the same spot and catch their stint in half an hour. I think that is pretty clear proof. I know that upon my own ground it is of no use attempting to fish in an east wind. These are facts, or common things not generally known. The oysters will move 24 hours before the east wind comes on. The next great cause of injury to the spat is the muddy water which has the effect of entangling the delicate swimming apparatus of the oysters, and of producing its death. Turbulent water also rolls the oyster over and over again, so that it has no chance of attaching itself. The water comes in on the long low flat shore on the Kentish coast with such a sweep that there is not only great violence on the top of the water, but there is an under current produced which is sufficient to carry out heavy objects to sea. I have known places where a boat has been sunk within 100 yards of high-water mark, and where with a heavy east wind blowing on the shore the boat has been found when the tide has gone down 400 or 500 yards further out. That has occurred more than once or twice. There is another thing also which proves that the violence of the water, and the mud produced in consequence, act injuriously upon the spawning of the oysters. When in an aquarium the oysters spat upon a clean surface. If there is a clean surface even though the spat falls to the bottom it will rapidly rise again, but let there be the slightest atom of mud, if the spat falls it will settle ; if it once touches it never rises again. I have also noticed the same thing when a piece of cloth has been placed at the bottom or in fact any substance whatever. One great necessity in order to ensure the well doing of the brood is that it shall meet as soon as possible after it falls with a bright clear surface, such as a polished shell which is by far the best thing, or the side of a small pebble. I have tried both bricks and tiles, but I believe that the oysters never will attach themselves to them if they can obtain their natural habitat. To prove that, I tried in the first place the experiments which were recommended by M. Coste, I had known something of Lake Fusaro when in Naples, and I tried fish weirs, wattle fences, floating fascines above the oysters ; floating planks with bushes, and I have also laid down tiles. In the first place I will say a few words with regard to weirs. There are three weirs on the Pollard ground, but I never saw a bit of brood upon them yet, nor do I believe that the oldest fisherman in the neighbourhood ever did, yet there are plenty of oysters to be found in the vicinity although there are none on these weirs, and nothing upon the fences. We have had them put in in all ways, in lines and diagonally to catch the tide and the run of the water, so that the brood would strain as it were through them, but in the course of two seasons during which that plan was tried there was not a single bit of brood obtained. The Whitstable company had an idea that their oysters in consequence of the rough winds would be carried to the Pollard Ground, and they put up an immense long wattled fence. I have examined that fence, but I never succeeded in finding one single brood there, and the men who have had weirs on the ground towards Reculvers never saw oyster spat there in their lives, and upon floating fascines there was never any brood that I could see, and in a similar manner tiles have also been unsuccessful. There might be one or two spat found upon them but nothing more.

61,528-30. Did you lay down tiles extensively?—No, not very extensively, but I laid them down in patches as big as this room. I put them on the best part of the bed, and the parent oysters were all lying round so that it was almost impossible for the spat to miss the tiles ; yet they were altogether unsuccessful. The fact is, that the tile is of a porous nature and the sediment that falls from day to day, falls upon that porous surface and is not washed away by the current. After all they have failed. There were certain places close to the place where the tiles were laid, where little ridges had been formed showing where the currents ran. There were found the shells of a fish that lives in the mud. The remains of those shells were very thick in some places and wherever they stood, there I found the brood of the oysters. I found it also on the shell of the cockle, and in some few places on stones ; that shows I think conclusively than an oyster naturally knows its best *habitat*, and that you cannot induce it to attach itself to these artificial things all the time it has a natural bottom to go to. On the contrary wherever there is natural culsh it will make use of it.

61,531. Did you find spat deposited in the immediate neighbourhood of these tiles, &c. on which you found nothing ?—Yes, all round. For instance, there would be in one place a gravel bank or certain little channels through the sand. In that case I should put my fence across in this way (*describing*) and another one so. I should then take another one so and I should place a whole lot of breeding oysters there although there were plenty lying all round upon the ground. I did that to give the experiment a fair trial. I put down two fences so and placed oysters on both sides. Here (*describing*) I laid down a lot of tiles ; there some floating fascines and faggots and all over the ground in the vicinity. There were not only natural oyster beds but oysters which were specially placed there. In point of fact, to give the experiments fair play I tried them in every way I thought likely to ensure the catching of spat.

61,532. Was the ground on which you tried the experiments a plot of ground upon which you were in the habit of finding spat naturally ?—Yes.

61,533. What was the result of the experiments ?—The result of my experiments was that I continued to find spat on the natural beds, but not upon any of the artificial means I had provided for catching spat. From that and from other experiments which I made in different years, I came to the conclusion that the young oyster—the tiny spawn or spat—as soon as it leaves the shell of the mother oyster has but one purpose in existence; and that is to attach itself as soon as possible to some object to which it may permanently adhere.

61,534. Is there such a difference in the quality of the tiles you laid down and the ordinary culsh as to make the oyster unwilling to attach itself to the former ?—I think that it has no chance of attaching itself to the tiles. The eddy is too great ; where there is a real obstacle like that the tide makes an eddy and the oyster spawn after having been extruded from the shell of the parent oyster is wafted along with it with only just sufficient power to keep itself afloat.

61,535. Then how does the spat contrive to attach itself to the natural culsh ?—I do not think it rises far from the surface of the ground, and there being very little eddy it drifts away slowly and attaches itself to the first favourable object it meets. For instance, wherever there is a shell lying on the ground, as the tide goes over it, it makes a tiny little eddy, and you will always find the brood underneath. I believe it is this little eddy that affords the oysters the chance of settling.

61,536. Why should it not have just as good a chance of settling under the artificial obstacles as under the natural ones ?—It has a chance, but I believe that it avoids it.

61,537. That is not always the case, because we have had produced before us tiles covered with oyster spat ?—No doubt that is so occasionally. (*Mr. Smith.*) Occasionally I have seen an old shoe covered with oyster spat.

61,538. (*To Captain Austin.*) Mr. Buckland, at our last sitting, brought to us tiles actually coated with oyster spawn. If your notion is correct, how do you account for that ?—It is easily accounted for on the French coast. If the same thing were to happen there again, namely, a tremendous spat on the French coast, it

LONDON.

Capt. G. Austin.

25 March 1865.

would occur again. You must bear in mind that there is nothing but sand all round that coast, and no natural object for the spat to settle upon. The only things it meets are these tiles and artificial culsh and it settles upon them. The first thing it meets may be a tile, and it will attach itself to it. But that is not the case where there is natural culsh. For instance, in the bay of Cancale, where a large quantity of oyster brood has been obtained, there is not a tile for many miles, but there are plenty of stones and other things, and they have been found covered with spat.

61,539. Then I gather from what you have stated to us that you are of opinion that the use of artificial means on the English coast, in the localities you have been speaking of, would be superfluous?—I think so, if the oysters have natural culsh to attach themselves to. Of course I should not dream of putting down tiles or anything else on ground where there is gravel or any sort of natural culsh; but then again I should never try to breed oysters upon a sandbank, because I know, and the oyster seems to know also, that it would be certain death to him if he happened to fall upon it. If it falls upon a smooth bottom, away it goes, turning over and over until it dies; but the first obstacle, after it leaves the parent shell, that presents itself to which it can attach itself as it flies by with the tide it avails itself of.

61,540. Do you think that the spat is capable of discriminating between the under surface of a tile and the under surface of a shell, so that it would elect the one rather than the other?—No, but in the case of a tile the spat is liable to be carried away by the stronger eddy formed by the tide.

61,541. The tiles are hollow underneath, are they not?—Yes; but the spat has a less chance of attaching itself to a tile than, for instance, to a cockle shell, which just stands up on the surface of the ground with its smooth shell ready at hand.

61,542. The result of laying down tiles on the English coast has not been successful?—No. There have, I believe, been 15,000 laid down at Shoeburyness during the last two years, covering something like 15 acres of ground; and my manager tells me that not one single spat has been found there. Yet you find that upon Mr. Smith's ground, which was well prepared for the reception of spat and covered with natural culsh, he got a fair proportion of brood, both early in the year and later. There were some spat obtained, I think he said, as late as the month of September; and yet his ground is only a few miles further up the coast than the ground where this large number of tiles was laid down. The tiles failed entirely, and I believe that they have also failed on the shores of France.

61,543. Might not the failure be due to some local circumstances, such as the temperature or condition of the water, and not to the nature of the things laid down?—My own opinion is that the failure of the brood is entirely owing to the water, but I think, at the same time, that if you cannot breed oysters naturally you will never succeed in doing so artificially. I think there is no question about that. I think that one of the great necessities is a clear running stream of cool water. It must be deepish water, and also cool. In the first place it is necessary for the food of the oysters that there should be a tide-way. No oyster can live upon nothing; and as he cannot run after his food, his food must be brought to him. That is only a common-sense view of the case. There must be a motive power to bring the food to the oysters, and that motive power is the tide which brings down animalculæ and other things, which fall into the oyster's mouth. He always lies with his mouth open by which means he is able to obtain his food; then in the case of any deposit of sullage it is removed by the tide and he gets his jacket cleaned after a time. That is one reason why nature dictates to him to lie with the convex shell upwards. If he laid the other way there would be no eddy to wash the shell clean. Then again there is another thing which I think is absolutely necessary and that is the air which always exists in moving sea water. My experiments have proved that the brood will always die in still water. There are no means of keeping it alive and after a certain time an oyster which has been allowed to remain in still water will die. It goes without food and becomes gradually starved. In my aquarium I have done all I could to keep them alive without supplying fresh water, but they invariably die. M. Coste says that down in the bay of Arcachon they breed oysters on the *claires*.

61,544-5. The *claires* answer to our parks?—Yes, except that they only have fresh water once a month in the spring time. I have had still water in my aquarium without a fresh supply, and I have put in oysters ready to breed within 10 days or a fortnight, but the young never came forth at all. When I opened them, a long time after their time, I found them agglomerated in the frill of the beard. That proved to me that they must have clear water. As far as M. Coste, Mr. Buckland, and others, who think that oysters are going to breed in ponds are concerned, I believe that they err greatly. I am convinced that a constant change of water is necessary, and I think Mr. Smith will acknowledge that if his oysters were left for six weeks in a small pond where there is no fresh water, they would become worse and worse instead of showing signs of improvement. In a fishery which I have in Ireland there is a large natural pond of water at a place called Cornerow. I took very great care in having it cleaned out. Every atom of dirt and weed was removed, and I then had it lined with beautiful culsh, tiles, pebbles, and everything calculated to catch spat, but I never had a single young oyster there. But, as I expected, in the channel which ran down the shore when the sea retired, I had an immense lot of brood. That, to my mind, was a convincing proof that, in order to cultivate the oysters successfully, it was necessary that there should be a stream of running water. In the channel I had a large supply, but in the pond I did not find a single one, although I had put 10,000 oysters there.

51,546. Had the oyster pond you refer to any communication with the sea?—There was only the one inlet at high water, but there was always a depth of three feet of water in the centre where the oysters were.

61,547. The tide did not wash upon it regularly?—No. Lord John Browne, the brother of the Marquis of Sligo, did not believe in my pond, and he made one of his own, which cost him a lot of money. It was about three times the size of this room, was surrounded by masonry, and was fed from the tide by means of a large drain pipe. He laid down oysters there, and they were all breeding oysters. There was no doubt about that. Yet there was never one single spat or brood obtained from them. They were examined most closely, but there was never found the shadow of a brood there of any age. After a time the breeding oysters themselves gradually deteriorated in condition, and even when they were removed and placed on other beds they were worth very little. Indeed, most of them died in the end. I think that, together with my own experience, is a proof that oysters will not breed in still water, but that there must be a regular current of water passing over them. Further than that, I have made inquiries among the Essex men who have a large number of ponds, but I never heard any one of them state that the oysters ever breed in the ponds. They will live there, but I never heard that they will breed there. There is an immense number of ponds down at Chichester and Emsworth and all along that country. They are large dealers in oysters, and they keep them laid down in ponds, but I never heard it asserted that the oysters breed in those ponds. Under all these circumstances I think I am justified in saying that the question of breeding artificially in ponds has been proved to be untenable, but whether the oysters may not be improved by artificial means is quite another question. The Herne Bay Company propose to put down large furnaces for the purpose of warming the water, but

as far as my experience goes water artificially made hot or warmed to any temperature is almost certain death to the fish. The oyster is naturally born at the bottom of the sea where the water is rather cooler than on the surface. I found in the boat which I had sunk near the shore, that upon very hot days the brood died in two hours, when if it was a cool cloudy day they would live for some hours longer.

61,548. Has any one proposed to make the water hot for the oysters?—Yes, that was part of the Herne Bay scheme, and I believe that both Mr. Lowe and Mr. Buckland made statements in favour of that plan.

(*Mr. Lowe.*) Mr. Lowe is now present and he must at once deny the accuracy of that statement.

(*Capt. Austin.*) It was certainly my impression that that plan was supported by Mr. Lowe. I have made these remarks principally with the view of showing that oysters must have running and moving water, and that by any artificial means of breeding by which they are detained in one position, and kept in still water, they will never thrive. If you have a chart before you I should like you to refer to a place near Cape Clear, namely, Lochhyne, where there is a small bay or basin about one and a half or two miles square. It is a kind of lake in the basalt rock only wide enough for a boat to enter, and about two miles long. In this lake there are a large number of fish. I examined the lake myself. It was very deep; in some places as deep as 300 feet, and as I thought there might be oysters there, I dredged it carefully. At the outlet of this lake the water runs over a cascade, and at the bottom of that Lord Carberry has formed an oyster bed for himself, and outside of that bed, all round and on each side of the headland, there are oyster beds. These are some of the oysters which I found in Lochhyne. Some of them are 40 or 50 years old, I believe. You would see what effect still water has upon them. See how circular that oyster is. That one is 10 or 12 years old, and here is another that is perhaps 20 years old.

61,549. In what way do you estimate the age of the oyster?—From the rings on the shell. That is the only way of estimating the age.

61,550. I suppose you know that there is a difference of opinion upon that point, and that it is disputed whether the rings on the shell form any criterion?—I believe that that mode of ascertaining the age is well known. That shell (*producing an oyster shell*) I picked up below the cascade, and I caught some of Lord Carberry's oysters, but the keeper was so strict that he would not allow me to take a single oyster away from the ground. Only a mile or two further on, at a place called Ringeroager, they dredge up the largest oysters I ever saw in Ireland. The largest one I measured was as much as I could span in length—about nine inches, and as far as I could reach with two fingers across.

61,551. Do you think the size in the one case was due to the still water, and in the other to the fact that the oysters were in the regular water of the channel?—Yes; the oysters outside that part of the coast are the largest I ever saw. But if you take them from Wexford, all the way round the coast, you will find that they are a very large description of oyster, but those at this particular place are larger than they are in the Irish Channel, St. George's Channel, or anywhere else.

61,552. Is the water in the basin which you have described to us as salt as it is in the sea?—Yes, it is precisely the same. I believe that if there could have been a stream of fresh water turned on the oysters would have been better. That warm water has nothing to do with the breeding of oysters is, I think, pretty well proved by the fact that they breed regularly in Greenland, in parts of Iceland, and in Norway and Sweden, as well as in the Mediterranean, and I know that they always breed every year. I believe that the only reason we do not have a good spat every year is that the water is made muddy, and the brood, though it is actually born, dies. That, I think, is the reason of the immense loss in the oyster trade. For the last fortnight the oysters have been dying at Whitstable in large quantities.

61,553. Natives? — Yes, natives, and Scotch, Welsh, and Falmouth oysters, all alike. The reason of their dying is this:—It is not the cold that kills the oyster, but the cold has the effect of swelling it so that it cannot quite shut its mouth. The mud, and sullage, and sand then get in and the fish cannot eject them, being weakened by the frost.

61,554-5 Then in that case the death of the oyster will be the consequence of the effect produced upon it by the cold?—The cold produces the first effect, but the cold alone will not actually kill the oyster.

61,556. The cold prevents the oyster from shutting the valves of his shell, and that has the effect of exposing him to conditions which afterwards destroy him?—The only thing upon our exposed shores that we fear the frost for is that at low water they freeze, and the tide afterwards carries them away.

61,557. Would not the oyster be killed by being frozen in that way?—If he were frozen for a sufficient length of time it would kill him certainly.

61,558. (*Mr. Lefevre.*) Do you mean that the oysters are floated away with the ice?—Yes.

61,559. (*Professor Huxley.*) They will not be dead before they are floated away?—It would take some hours to do that.

61,560. It would take some hours to make ice sufficient to freeze the oysters?—Little thin cakes of ice will be enough.

61,561. But being for some hours subjected to the action of the frost, would not the oysters be dead by the time they were floated away?—No; they will bear a good deal of frost at times, but if there is a wind it will kill them. I should like now, with your permission, to say a few words with regard to the necessity of maintaining a close-season. I think there can be no question of this, that if the close-season were enforced upon the Whitstable ground it would ruin the fishery altogether. There is no question at all about that. I quite agree with what Mr. Smith said, namely, that the ground upon which freshets are constantly coming and bringing sullage with them requires to be continuously cleaned. Then again a heavy gale of wind will come on, and roll up the oysters in a ridge three feet deep. Great injury would be done to the oysters unless they were worked, and by working them in the course of a day or two they would all be spread over again. When they are spread the mud all goes away, but if they were left on that ridge the mud would settle all round them and kill them very rapidly. In the next place, that ridge, if allowed to remain, would cause an eddy and a fresh deposit of mud all round it for many yards. In the next place, it is just at that time of year that we want to work on account of the five-fingers coming upon the beds. They come like a flock of gulls and unless they were well dredged they would soon destroy the spat. There is one kind that will eat an oyster itself; yet it is a singular thing with regard to them that after they have been dredged for a time they roll themselves up and float away. So much is that the case that in places where the fishermen have caught 10 bushels of five-fingers one day they will go out the next day and not catch one. If during the close months the fishermen were unable to dredge, of course it would follow that the five-fingers would soon clear the oysters off the beds. To show the advantage of working the beds in the summer time, I may say that about four years ago, some time after the great spat in 1858, the Whitstable Company, when the oysters came, wanted more ground. There was a piece of ground about half a mile in extent lying on the east side of the regular ground, which had not been worked by the company, because they thought it was useless to work it. Well, they took it into their heads to work upon it and clean it, and it was said last year by two of the jury that since the time they had cleaned it they had sold off that piece of ground alone more than 150,000 bushels of oysters. Indeed

LONDON.

Capt. G. Austin.

25 March 1865.

that ground now is one of the best pieces of ground they have, and upon that half mile they lay their brood.

61,562. Is that ground on the east side beyond the little spit of sand which they call Whitstable Street?—No, it is above Whitstable Street. They do not lay down oysters below Whitstable Street. I think also that it is a necessity that the dredgermen should be allowed to work over the public grounds as well. I am alluding now not to the Essex ground as much as to the Whitstable ground, because there is no dredging for whelks and other things there to keep the ground clean before the spat arrives, so that when the time for the spat arrives there are no weeds or mud or anything except a bright clear bottom. The result of dredging constantly over the Essex beds is that spat falls there that would never fall if the beds were left to become swabbed up. There are a few spots round Pan sand which a few years ago they never thought of dredging, but they happened to find some whelks rather thick there and they dredged round and round until in the next year they found oyster spawn. Gradually it came more and more and now they always get a little spat there even if they do not get it anywhere else. Then those other things that eat the brood and do injury to it, such as sea anemones and sea purses, and the like, are all killed by dredging. As to whether it is more productive to keep up a continuous system of working on the beds, my opinion is that if the grounds were not worked there would be very little production of spat. No doubt if you dredge too soon you lose a certain quantity, but what do you lose? It is the opinion of most of the old experienced dredgermen that you may lose about one-fifth, but then the remaining four-fifths are saved. They are carried off to private beds where they are carefully tended and looked after. If the whole were left on the beds without being dredged the result would be a far less supply of oysters. In the first place they would become a prey to the starfish, dog whelks, and everything else, and if the close season were strictly kept and all dredging put a stop to the beds would become smothered up with dirt. Therefore upon the whole I think it of advantage, having regard to the increased supply of oysters, that the public grounds should be worked in the close season as well as the private beds.

61,563. What check would you impose in order to prevent the breeding oysters from being taken away?—They never would be taken away to eat. In point of fact you could not eat them.

61,564. But you are aware that there is a large demand for oysters all the year round?—Yes, but the oysters which are taken at that time for sale are the common oysters. I am speaking of native oysters, which are not in season although the common oysters may be. The reason of establishing a close season, in a common-sense view, is to prevent oysters from being taken for the purpose of eating at a time when they are unhealthy. That was the reason why a close season was made, but if the oysters had recovered from breeding they would be good. There are some oysters that never breed at all, and those oysters will be found as good in the middle of the summer as in November.

61,565. Do you think that the people who consume the great proportion of the common coarse oysters in London are very particular about the oysters being sick or well? Do they not go down just as well whatever their condition is?—The colour would soon undeceive anyone. With regard to legislation for the improvement of the oyster fisheries and for the preservation of the spat, you have put questions to various witnesses who have been examined before you with the view of ascertaining their opinion upon that subject; I should like to say a word or two upon the question myself.

61,566. We shall be very glad to hear any remarks you have to make.—The only benefit which we could obtain that I am aware of would be from the adoption of some measure which would ensure us a large supply of spat. But as we cannot produce that by any artificial means, the only thing we can do is to endeavour to attain that result by natural means, namely, by keeping the beds clean and in a fit state to receive and preserve the spat when it does come. In other words, we should be allowed to work in the season just before the oysters begin to breed, so that the beds may be kept clean. In that way I believe that millions of young oysters would be saved that otherwise must be lost.

61,567. Would you advocate the removal of all restriction upon the oyster fishing altogether?—So far as my experience goes it is this:—There is no spat so valuable as the Essex spat and that which is on our own coast, and which is native spat, and in dealing with that spat, so far as I have seen, a man's common-sense is quite a good enough guide without any interference on the part of the Legislature. In other cases a man's common-sense is his guide. For instance, in shrimping, without any obligation to do so they throw overboard the little shrimps which they bring up in their nets, and the same sort of thing would be done in this case. After dredging for a fortnight or ten days on the flats the experienced eye of a fisherman would enable him to perceive the presence of the young spat, and he would at once say, "We must now "knock off our work here and wait for a fortnight or "so." The boats would not go out then, and in another fortnight they would be able to resume dredging.

61,568–9. Then are you of opinion that the question is one which practically might be left to the fishermen's sense of their own interests without imposing any legislative restrictions?—That might not be the case all the year round, but generally speaking they might be left to their own regulations, as in Herne Bay and Whitstable. Although they are not interfered with by legislative restrictions in those places, they only carry on dredging when it is advantageous to do so.

61,570. If legislation can be dispensed with with regard to two of the months of the year which are at present close time, why could it not be dispensed with all the year round?—I have no desire to see any restrictions carried out at all. We never have had any upon our beds, and upon the Essex coast I believe it has been the same.

61,571. Would you leave both the public and the private beds open?—Yes. Large sums of money have been invested in property in connexion with oyster-fishing with the object of obtaining from the public and private beds a large supply of a valuable article. I believe that those who have invested this money and whose interests are at stake will among themselves take good care of those interests. Even supposing that the fishermen themselves were ignorant and persisted in going to work when it was likely that they would do mischief, that evil would soon be remedied, because their object at that time is to obtain oysters for the private beds, and the owners of those beds would refuse to buy what they dredged up. There would be a combination, in point of fact, against dredging at an improper period.

61,572–3. But how would you meet the case of the foreign buyers who are anxious to obtain oyster brood?—I believe that the provisions of the Fishery Convention Act prevent them from taking brood.

61,574. What would you do, supposing that persons from some other locality wished to form oyster beds in other parts of England; would you allow them to come and obtain brood?—Yes; I think that all of us must be allowed to compete with one another for the brood.

61,575. You would leave it open?—Yes; I do not think that restriction can possibly do any good. But there is one point which I think is a very serious one for you to consider, and I should like to make some remarks in reference to it. I refer to the Fishery Bills at present before the House of Commons; there are one or two Bills with regard to Essex which I do not intend to say anything about, but I wish to say a few words in respect to the Kentish coast. I know that what I am about to say is true. Near the Whitstable beds there is a certain piece of ground which they

call the flats; last year there were hundreds of poor fishermen working upon those flats, and it was only by so doing that they were able to support their wives and families. There (*pointing to the chart*) lies Whitstable. The oyster grounds extend as far as this point, and from there all down the coast lie what are termed the flats; it is from that ground alone that we can get native brood; we can obtain it nowhere else, and from Whitstable there are hundreds of men who are non-freemen who get a living in the slack time of the year by working on those public banks. There are also a large number of boats that come across from the Essex side, and the spat they obtain there they sell to the owners of different private grounds. It is sought by a Bill in Parliament to convert this public fishing ground into private property, yet the ground is far more extensive than could be worked by any private company. At the present moment I believe the extent of the Faversham ground is nothing like two miles square, and they do not use more than half a mile of that. The Whitstable ground is the largest and most thriving fishery ever known in the shape of an oyster fishery. The stock of the Whitstable Company was assessed last year by the old men of the jury at 400,000*l.*; I believe they were not far wrong in their calculation, for if it is considered that they can sell oysters which bring them in from 100,000*l.* to 120,000*l.* and 130,000*l.* a year, and that the oysters generally come to maturity in four years, the parent stock will be worth nearly 400,000*l.* They have in their possession three miles of ground, but they do not use two miles of it or anything like it, yet last year Parliament granted to the Herne Bay Fishery Company a piece of ground from the middle of the flats six miles square, and the very best part of the flats too. One would have thought that that was enough, but this year the Herne Bay Company are asking for more ground, and the Whitstable Company, although they cannot use all the ground they have now, ask for the whole of the ground running from their present boundary down to the Herne Bay ground, and then for the ground outside that of the Herne Bay Company. If Parliament grants to them what they are now asking for the Whitstable Company will become one grand monopoly, because if they are to have all the spat it is obvious that no one else can obtain it, and at the same time they would be unable to use the ground if they had it. With an immense stock and capital estimated to be worth 400,000*l.* they cannot use all the ground they have now, and under those circumstances what can they want with seven miles of ground more?

61,576. Do you think that their object in applying for this ground is to enable them to keep off competitors?—No doubt that is partly their object, but they have also another object. In a good spat season like that of 1858, the spat that fell upon the flats was worth at the lowest farthing 400,000*l.* or 500,000*l.* That is their real incentive for wishing to have that ground exclusively in their own possession, namely, the value of that which may not come more than once or twice in the course of six or seven years, but which when it does come is of enormous value. Then again the company's ground by the time a spat comes, may be out of native oysters the same as it is now, and see what a fortune it will be to them to be able to collect all the spat from the flats and spread it over their own beds, and keep it until it is of sufficient age to be sent to the market.

61,577. But is there not another side to the question, namely, the interest of the consumer?—I am going to refer to that. How does the case stand now? At present private owners and the Whitstable Company, and everybody who wants the spat, have to compete for it, and have also to compete in the market for the sale of oysters. But if you once place all the oysters in the hands of one great company, they will be able to ask any price they like for them. The Whitstable Company now rule the market, but they have to contend with competition. Yet, give them a monopoly, and then see what price they will ask.

61,578. Would not their stock of oysters rule the market? Would that not regulate the price of itself?—No, I think not.

61,579. If a man has a perishable article to dispose of, will he not always sell it in the market as soon as he can?—Yes.

61,580. Then will not that control the price?—No. If, for instance, Mr. Grove, the fishmonger, has the only salmon in the market, instead of selling them at 1*s.* 6*d.* a lb. he could make you pay 6*s.* or 7*s.* a pound instead. Of course he must sell them fresh, but there would be a sufficient demand to give him his price. It must also be borne in mind, that the ground which is proposed to be taken is that upon which hundreds of fishermen are in the habit of working for a livelihood at the dullest part of the year.

61,581. The argument of the other side is, that unless you give to the capitalists the privileges they ask for, there will be no one who, at the time of a great spat, will have the means of taking advantage of the spat, and the crop will be practically lost to the consumer?—That, I think, is decidedly wrong.

61,582. The argument which has been brought before us is, that unless capitalists have certain rights granted to them, it will not be worth their while to prepare the ground in order to make it ready for the reception of a good spat, and in that case when a good season comes, the spat will be lost?—Exactly. (*Mr. Smith.*) In the case of the river Roach we ask for powers to make that which does not already exist. (*Captain Austin.*) The value of the ground affected by the bills before Parliament is according to the quantity of oysters it produces, and that depends upon the amount of work to be laid out upon it. Then, who is most likely to lay out their labour upon the public grounds—the poor fishermen or the capitalists who form the private companies? A private company would view the question in this light: "It will cost us 1*l.* a boat to send out men to dredge upon this ground. We know there is nothing there worth catching. There has been no spat this year, and therefore we will not send out. Let the ground remain unworked." But in the case of the poor fishermen it is very different. The ground always gets worked by them. They must get a dinner in some way or other, and they will go out with perhaps three hands and four dredges in the hope of getting perhaps 18*d.* a-piece. A private company will not lay out a pound's worth of work in the chance of only getting 1*s.* 6*d.* or 2*s.* 6*d.* but a poor fisherman must do so or starve.

61,583. (*Mr. Lefevre*). Is not that an argument rather addressed to the particular form, and condition of the Whitstable Company?—I am speaking of that particular ground.

61,584. The rules which govern that fishery are entirely different from those which would apply in the case of a company under the ordinary influences of capital?—Yes, because they must lay out their money.

61,585. Your argument is addressed against the monopoly which would be created by putting this ground in the hands of the Whitstable Company; you would not object to place it in the hands of other people?—Yes, I would object to giving it to anybody. If it is once placed in private hands, it will never be worked except in those years in which there is an immense quantity of spat. It is an immense area of ground, but notwithstanding that fact, it will always be worked while there are public boats coming to trot for whelks and dredging for whelks and oysters over it; in point of fact men will go there in order to earn for themselves 1*s.* 6*d.*, or 4*s.* or 5*s.* a day, and in earning that they will lay out the same amount of work as would cost the company 1*l.* or 25*s.* A man who has nothing else to do will work for very little, rather than starve.

61,586. (*Professor Huxley.*) Does not that show that the condition of the labour market is such, that

LONDON.

Capt. G. Austin.

25 March 1865.

it is worth the while of the fishermen to work for that wage ?— Yes.

61,587. If there is a market for the commodities obtained by the fishermen, would it not be worth while for a company to employ the fishermen to obtain those commodities ?—If it were so much to be sold over a counter it would, but a company would refuse to send out 40 or 50 boats to work in keeping the ground clean on the chance that a spat will come. If I knew that there would be a spat I might lay out 2000*l.* or 3000*l.* or even 10,000*l.* in cleaning the ground, but on an average there is not a good spat more than once in 10 years at Whitstable; of course I mean a large remunerative spat. I think that neither I nor anybody else would be prepared to throw money in the sea in that way.

61,588. (*Mr. Lefevre.*) Did not the Herne Bay Company get their bill on the ground that they would spend a considerable sum of money on the ground in cleaning it ?—Yes, but they have not done so, nor could you ascertain what they were doing in that respect, unless you had some means of summoning the Herne Bay Company's officers and making them produce their books. It is only the people who live in the vicinity who know what work is done upon that ground, and how many oysters they have laid down. If you had any means of arriving at the real facts of the case, I believe you would see the truth of the argument I am holding. If capitalists would really expend their money in keeping the ground clean that would be another thing.

61,589. If the only object of the Herne Bay Company were to appropriate the spat which falls only once in 10 years, then your argument would be a good one, but it is alleged on the other side by the Herne Bay Company, and those persons who wish to appropriate similar ground, that it is their intention to clean the ground, and render it fit for the reception of the spat, and make use of it in the same way as is now done by the Whitstable Company ?—No private company could ever do that over such an extent of ground if they had the Bank of England at their back, because they would be required to spend 6000*l.* or 7000*l.* a year for nothing, for perhaps nine years in succession.

61,590. What is alleged to be spent by the Whitstable Company and other companies at present ?—On our private grounds we must work whether we get spat or not.

61,591. They intend to work the ground as far as we have been given to understand ?—Suppose that a small piece of ground like the Whitstable ground, requires 400,000*l.* worth of oysters to stock it, how many thousands of pounds worth of oysters would it take to cover the piece of ground six miles square, which the Herne Bay Company have ? How many square yards are there in six square miles, and how many native oysters would they require ?

61,592. But if ground is given to a company having no interest in the Whitstable Company, would they not become great competitors with the Whitstable Company, and by that means tend to reduce the price of oysters in the market ?—It never could happen in that way, because there are plenty of competitors now. There is an immense number of competitors now.

61,593. You say that the Whitstable Company rule the market ?—Yes, but that is because where Mr. Smith and others can send in one bushel of natives, the Whitstable Company can send in a thousand.

61,594. (*Professor Huxley.*) Your purpose is to show that the object of these bills for appropriating great tracts of ground, is to enable certain persons to get possession of the river bottom, so that they may be in a position to take possession of the spat when it comes ?—That is their real motive.

61,595. You are of opinion that that lies at the bottom of the matter ?—Yes, but besides that, the ground is too large for them to lay oysters upon. There is no amount of capital they could raise by which they could do that, and even if they did, they could not get sufficient oysters to enable them to do so. There is not an oyster merchant who would not, this year, have bought twice the quantity he has purchased, if he could have got them. What I say with regard to this ground is, that in the first place, you cannot get a sufficient supply of oysters to stock the ground, and in the next place, it will be impossible for the public to derive more benefit from that ground than they do at present. There would also be hundreds of poor persons thrown out of employment who are now able to get a living from this ground.

61,596. You would not have made any objection to the assignment of a reasonable space of ground ?—Not the slightest. I would give them as many acres as they could possibly cover. My only reason for bringing this question before you is that I believe the decision upon the bills now before Parliament awaits the Report of the Sea Fisheries Commission, and I want to show you the wickedness of making these extensive grants of five or six square miles when the acreage of the largest oyster beds at this moment is very limited. The largest of all is the Whitstable ground, and if measured fairly the beds will be found to lie within one and a half miles. The market ground is only a few acres in extent, and yet all that immense stock which I have mentioned to you lies there. My ground is very much less, and so are all the private grounds. (*Mr. Smith.*) The ground in the Crouch river is 17 miles in length by three quarters of a mile in width.

61,597. You look upon these bills as you would upon bills brought before Parliament to assign to railway companies 10 miles of land on each side of their line ?—(*Capt. Austin.*) Yes, precisely.

61,598. (*Mr. Lefevre.*) Am I right in understanding that under the provisions of the Herne Bay Companies Act, unless they work their ground for the purpose of cultivating, the Act is to be void ?—The Act is drawn up in such a way that you might drive all the coaches and four in London through it. The wording is something to this effect, that the Act shall remain in force provided within three or five years the said company shall produce marketable oysters to the satisfaction of the Board of Trade. Now what difficulty can there be in doing that ? They can buy, for instance, from Mr. Smith 500 or 1,000 tubs of oysters, lay them down for a year, and send them to the market in the next season. In that case they will claim to have produced marketable oysters.

61,599. (*Professor Huxley.*) Will it not be for the Board of Trade to say whether the provisions of the Act have been complied with, and if there is a *bonâ fide* supply of oysters to the market ?—All I can say is that the whole of the oysters in the United Kingdom could not supply that ground.

61,600. Is there any provision in the Act requiring them to produce so many oysters per acre ?—No; nor are they to produce oysters all over the ground.

61,601. Might not that question for the future be met by some more definite clause with regard to the cultivation of the ground—a clause, for instance, providing that in case the ground is not really stocked, the privileges of the company shall be withdrawn ? —I should like to suggest whether you can give any reason why the Whitstable Company have this year become the promoters of one of these bills ? It costs a good deal of money to go into Parliament, and fight a matter of this sort in a committee in the House of Commons. But the poor people whose interests are most concerned will have nobody to speak for them. If they said anything against the bill the Whitstable Company would never buy an oyster of them again. They would have to go somewhere else for their market, and would have to leave Whitstable too. This, as you must admit, is a case that is most glaring. There is a company who now have three miles of ground, but a large portion of it they never use at all. They do not use anything like two miles. And they have all this large sum of money invested upon it. Yet this company seek now to take possession of a piece of land extending up to that granted to the Herne Bay Company four times as large as

that which they now have. And further they propose to go outside the Herne Bay Company's ground altogether to Reculver, nearly as far as Margate.

61,602. We can understand the argument as against the Whitstable Company, but we do not understand it as against any other company being formed to appropriate the ground, provided that it intends to use the ground for the purpose of cultivating oysters in the same way that the Whitstable Company cultivate their ground?—All I wish to impress upon you is this, that there should be some sort of arrangement in this matter—something like the Lands Clauses Act, which, when a railway seeks to pass through land, gives the company what is necessary for the purpose of their railway but nothing more. That is not like the American system, where, if the line is granted, the company are allowed to take 10 or 15 miles on each side, not that they can use it, but because it tends to keep off the competition of other people.

61,603. If in the neighbourhood of Whitstable there should be ground fit for the breeding and growth of oysters, would it not be to the advantage of the public that it should be converted into private ground rather than that it should be dredged only once in 10 years, whenever a spat may happen to fall?—There must be a certain amount of public ground preserved for the benefit of private beds, and therefore it would be wrong to allow the Whitstable company, for instance, to take possession of all the ground in the immediate neighbourhood of Whitstable, and shut it up.

61,604. The quantity of spat would not be diminished; there would be as much falling as ever, and even more preserved, because more would be likely to fall upon cultivated ground and less upon uncultivated ground?—True.

61,605. Therefore a greater supply of oysters would be insured to the public if these grounds were converted into private grounds?—Yes, but my case is this, that although a large breadth of ground like this is worked as long as it remains public ground, if it were placed in private hands they would not go to the expense of working it.

61,606. You are aware that it is alleged by these private companies that they do intend to work the grounds the same as the Whitstable company?—They may tell you so, but they would not do it; it would cost too much. The ground I have now, originally belonged to the neighbouring company, who were exceedingly annoyed at its passing into my hands.

61,607. (*Mr. Lefevre.*) Did it belong to the Whitstable Company?—Yes, but I am chief owner now. Of course they were somewhat spiteful, and they worked the ground with the whole of their boats, somewhere about 100, as long as they could; in point of fact up till the clock struck 12 on the 29th of September. Yet I was able to sell in the market 1800*l.* worth of oysters which they had left. I think that proves that you cannot entirely clean the oysters from the ground

61,608. After they had cleaned it as well as they could you were still able to get 1800*l.* worth?—Yes.

61,609. (*Professor Huxley.*) Are there any further points you wish to bring before us?—That is all I have to say as regards these places.

61,610. Your objection is not to the principle of making grants to private persons or companies for the cultivation of oysters, but you insist that each grant should be moderate in extent, and that it should not be larger than can fairly be used?—Yes, and I should object to see the most valuable piece of oyster ground on our English coasts entirely swept away.

61,611. What do you mean by entirely swept away?—I mean granted out to private companies. At present it is the nursery ground that feeds certain oyster beds on the coast, and which has done so from time immemorial. It would be rather hard to see a few capitalists step in and take exclusive possession of the public ground, especially when it is impossible for them to make as much use of it as is being made at present.

61,612–3. That is the question which is disputed: it is considered by some people that by granting these grounds to a few private capitalists the public in the long run will benefit more than they do at present. You argue that that will not be so, but is not the case like that of enclosing common land? A number of poor persons may have been in the habit of obtaining advantage from it by turning their cattle upon it, but the capitalist says if you enclose it you will make it yield more food to the general public?—But in this case the capitalist says, "do so and so," which is an utter impossibility. I think therefore that what he says should be taken *cum grano salis.* I object to the granting of property of this nature with so lavish a hand. I object to take a living out of the fishermen's hands merely for the purpose of allowing the ground to lie there at the service of certain speculators for the purpose of putting a certain number of thousands of pounds in their pockets at a future time. At the present moment there is a great competition for oysters in different places. I have known brood sold at Falmouth at 1*s.* 10*d.* a tub, but this year it has been fetching 36*s.* Arklow oysters which used to be sold for 3*s.* and 4*s.* have this year been fetching 22*s.* 6*d.*

61,614. (*Mr. Lefevre.*) Are they oysters fit for laying down?—Yes, for the stock.

61,615. Of what size are they?—Of all sizes.

61,616. Going down to quite small oysters?—No, from Arklow you never have very small brood, but from Falmouth you do.

61,617. (*Professor Huxley.*) Even supposing that these great grants to private companies were contrivances merely for catching the great spat when it does come, might it not be of benefit to the public to make such grants, because so much more of the spat would be saved than under other circumstances?—I say that much less would be saved.

61,618. Why?—Because the public work would keep the ground clean, but private work will not do it.

61,619. The public work consists in working for whelks and other things?—Yes, and in dredging for oysters besides.

61,620. Do you consider that that kind of work would be sufficient to keep the ground clean?—Certainly, and a proof of that is that upon that public ground when a spat like that of 1852 comes, there is a great deal more spawn to be found on those public beds than on the private beds alongside. Although our ground is really worked there is deeper water outside, and the brood has a better chance. There is no hot water running in from the shore, and no shallow water in which the mud can accumulate, nor is the spat washed away by a flush of water along the coast; but outside it can find substances to adhere to in the stream.

61,621. Do the persons who work on the public beds get sufficient from other things besides oysters to repay them for their labour?—Yes.

61,622. Are the public grounds capable of supporting sufficient labour at a remunerative rate to ensure their being kept clean?—Yes, I think so.

61,623. Then why would not the private companies pay for the necessary labour?—Take the case of this town. A man will go out regularly on the chance of getting a job, and he will wait about all day for it, but no one would give him 5*s.* a day to be in attendance. Yet he will go out himself on the chance of getting half-a-crown or a shilling for holding a man's horse or something of that sort. A man who must have a meal finds that he must go out, but no one would pay him regularly for doing so.

61,624. The analogy you draw is hardly fair. The fishermen are a stationary population, not like that of London?—They are Whitstable men, some may come from Essex.

61,625. But practically they are a stationary population?—Yes.

61,626. So that they must be able to earn off this ground enough to keep themselves?—Yes.

LONDON.

Capt. G. Austin.

25 March 1865.

61,627. If these private persons can do that why should it not be competent for a company to employ them and pay them wages in exchange for the produce of their labour?—In the first place, a business will keep one man that will not be sufficient to keep a joint stock company. He will be able to get a living out of it where a company could not; for instance, he would go out with a couple of boys on a cold frosty morning and would dredge up perhaps ninepence worth of whelks. He may also pick up a few flounders, half a gallon of oysters, and perhaps two shillings worth of spat. He will know very well where to get rid of his whelks, and of his flounders, and of all those things, whereas a company would not be able to go out and sell a few pence worth of whelks, and two shillings worth of fish. Probably he knows that there is a boat running down from London, or one going up, which will be very glad of what he has caught, and thus he gets a market for his whelks with his neighbours, and the other things he disposes of in the same manner; thereupon it does pay him for his labour and time, although it would not pay a company.

61,628. It is the case of small holdings and spade labour against husbandry on the great scale?—Yes.

61,629. (*Mr. Lefevre.*) Your ground immediately adjoins that of the Whitstable Company?—Yes.

61,630. Do the Whitstable Company make as much of their ground as you do?—I do not think they make nearly as much as a private person would do.

61,631. The Whitstable Company is in the nature of a kind of co-operative society with an exclusive right of fishing over the ground belonging to them?—Yes.

61,632. Might more be made of it by converting it into an ordinary joint-stock company?—I think so, for this reason: if you had officers with a certain tenure, and answerable to certain persons, a great deal more might be made of the ground; but a constant change of uneducated men for officers, and a constant change of government, must be injurious. I think a great deal more would be made of the ground if there were a steady hand at the helm.

61,633. Do you think it would be undesirable to extend that principle of incorporating fishermen who have been in the habit of fishing in a particular spot and of giving them an exclusive right of fishing on the ground?—With wise rules and regulations it might be made a most advantageous thing for the fishermen, but not if you are to take the Whitstable Company as a guide in everything.

61,634. Do you think it would be better to vest the soil of a fishery in a private company?—I think so. In a case like Whitstable the men all insist on having their money, and the oysters must be pushed into the market. They will sell them whether they are fit for sale or not in order to produce cash, whereas, in many cases, if they had kept them for another season they would have been worth a great deal more.

61,635. Do you think that the constitution of the company is not such as to give capital its full advantage?—Certainly not.

61,636. Do you dredge your own ground all the year round?—The men are generally at work except possibly in the case of a large brood. If they find it falling they would certainly leave off dredging at once.

61,637. For how long?—Until the brood was large enough to be handled without danger.

61,638. How long would that be?—Perhaps it might be five or six weeks.

61,639. Do you think it would be of advantage to the public if such a restriction were generally carried out over all the public ground and the fishermen were prevented from dredging when the brood is falling?—It is very hard to speak of what the effect of a general measure like that would be, but in some cases it would do an immense deal of good.

61,640. Take the public grounds you call the flats. Is it desirable that the fishermen should be restricted from dredging during the five or six weeks when the spat is falling?—No I think not.

61,641. Would not the same rule as that carried out on your private beds be advantageous upon the public beds?—It is in reality carried out exactly the same there. The men know instantly when the spat is falling, and they know also that they cannot touch it until it is large enough to handle, knowing that it is worth so much gold in their pockets when sufficiently strong to take. I think they will not go out wilfully and disturb it.

61,642. Do you know what number of men there are at Whitstable other than those belonging to the Whitstable Company?—I should think there may possibly be 250 fishermen, but I have no certain knowledge; I judge that from the number of boats.

61,643. You have also got an oyster ground in Ireland, I believe?—Yes.

61,644. Where?—In Clew Bay.

61,645. Do you bring brood from that ground to your ground here?—Last year the ground in Clew Bay was entirely plundered. I have sent some this year as an experiment. I have sent a cargo, but I do not know what has come from it at the present time.

61,646. What sized oysters are they?—Some have been sent of that size (*exhibiting an oyster*) to try to make native spat out of that which comes from elsewhere. Some were also sent to see what the effect of a change of water would be. The shell of the Irish oyster is very bad.

61,647. Have you only sent them as an experiment?—Chiefly as an experiment, but I hope they will go to market. Nearly all the oyster proprietors on the west coast of Ireland suffered last year from a sort of madness that took possession of all the fishermen. They went in hundreds and swept all the grounds, although many of them had been private grounds for 60 or 100 years.

61,648. Was that in consequence of the Fishery Commissioner in Ireland having made some grants of fishery licences?—I believe it arose in this way. An Irish jury will not convict. Some of the fishermen were brought up once or twice, and there was no conviction, and they thought they could do just as they liked. The lawyers there are very different to what they are here. There are many of them who will take half-a-crown for defending a case in the magistrate's court, and some of that class of people told the fishermen that they would get them off.

61,649. From your observation in Clew Bay, can you say whether the regulations as to the size of the oysters dredged up there are observed?—The regulation there restricts oysters from being taken below $2\frac{1}{2}$ inches in diameter I think.

61,650. Is that regulation observed or not?—It was observed until last year, but last year I know it was not.

61,651. Have you found any difficulty in purchasing small oysters there?—I have found a great deal of difficulty, but I know that a great many have come to England.

61,652. For the purpose of being laid down on other beds?—I believe they went to Scotland.

61,653. Have any of the oyster beds been exhausted in Ireland?—Yes.

61,654. In consequence of the oysters being taken too small?—Yes, nearly all of them. The exhaustion, however, has taken place not from overworking but from the close season. The Gulf stream comes in there with such a gush of warm water that the weeds grow in a marvellously short time. A dense mass of mud and dirt accumulates, and what chance has the oyster under such circumstances?

61,655. Has your experience in Ireland extended over any number of years?—About three or four years, and I believe I have visited personally, with one or two exceptions, every oyster bed in the country.

61,656. Can you say from your own personal ex-

perience that the weeds grow in the way you have described?—Yes, I have observed it.

61,657. Then do you think that the enforcement of the close-time has operated injuriously?—Yes, in certain places, and in the Channel Islands especially it has operated injuriously.

61,658. Do you get any supply of small oysters from the Channel Islands to lay down on your beds?—No, I get no small ones. Last year there was a large supply of oysters from the Channel. They discovered some new beds.

61,659. Were they small oysters?—No, they were not brood; I never saw any brood from the Channel.

61,660. Do you think the Convention Act is strictly carried out in the Channel, and that it has entirely prevented the take of brood?—I believe the French evade the Convention Act, but not the English. I have known a case of French boats taking brood. They take the oysters very small.

The witness withdrew.

Mr. JAMES LOWE called and examined.

61,661. (*Professor Huxley.*) You are interested in the oyster-fishery question, I believe, Mr. Lowe?—I have been for a few years engaged in inquiring and examining into matters connected with oysters.

61,662. Will you be good enough to put us in possession of your views as to the points which you consider to be of importance?—In the evidence of the last witness, he introduced my name in connexion with the evidence given before the House of Commons in favour of the Herne Bay bill. Now it is quite true that I gave evidence before a committee of the House of Commons with regard to that bill, but it was against the bill; if you will permit me I will state the chief grounds upon which I opposed the passing of that bill.

61,663. Would your statement apply also to the passing of similar bills?—I think it would, and I will give as shortly as I can the result of my investigation. I may premise that I entered on the investigation at the invitation of the proprietors of a public newspaper whose attention had been called to the subject, and who desired only to see that right was done. They deputed me to go down and make an inquiry, and I went over the ground with considerable care. I spent a number of days there engaged upon what might be called a private public commission. I saw a great number of fishermen belonging to the neighbourhood from Essex and the coast of Kent.

61,664. (*Mr. Lefevre.*) Does the statement you are about to make to us call in question the propriety of granting the Act of last session?—No, I will only give such reasons as will apply to other cases. I found that upon the ground applied for by that particular company there was already existing an important public fishery. From the neighbourhood, including a distance of 30 miles, there were boats constantly fishing over the ground, not only from Whitstable, but from Faversham, Leigh, Queenborough, and all parts of the estuary. I found that a fishery existed there which was estimated to be worth from 16,000*l.* to 20,000*l.* per annum, and I found that a company was applying with a capital of 100,000*l.* for the exclusive right to a valuable fishery of that nature already existing. I found that upon this ground there fell periodically, from time to time, whenever a plentiful spat occurred, a large crop of brood, and there could be very little doubt that the majority of that spat, in fact ninety-nine hundredths of it, came from the stock of oysters belonging to the Whitstable and Faversham Companies. It was, in fact, their spat, but having fallen on common land it became public property. In the evidence of the last witness he stated that in 1858 something like 40,000*l.* worth of spat was recovered. Now the Whitstable Company told me that in that year they purchased to the tune of 73,000*l.*, and all that was recovered by the public fishermen of the estuary.

61,665. That spat would be obtained from a considerable extent of ground?—It was obtained from the ground round the flats. With regard to the flats a good deal of dispute has arisen. Geographically they extend over the whole of the estuary, but I believe that the most valuable portion of the flats, upon which the spat fell in the greatest quantity, was that which has been taken by the Herne Bay Company.

61,666. That happened to be the case in that year?—I believe it is always so whenever a spat falls. The actual fishing is confined mainly to the piece of land taken by the Herne Bay Company. Under these circumstances it appeared to me that what was being asked for was a great injustice to the public of the neighbourhood. I leave out of the question the general public of England as being only entitled to a secondary consideration. There was, however, an actual public in the neighbourhood getting a living from this ground, and I found on reading the bill that the company proposed to do a great many other things besides oyster culture. They proposed, for instance, to build piers, make a railway, and Sir Charles Fox in his evidence told us——

61,667. (*Professor Huxley.*) Allow me to interrupt you, Mr. Lowe. It is necessary for us to avoid entering into a discussion of a question which has already been settled by Parliament.—I know that, and I will try to avoid it as far as possible.

61,668. I think it would be better if you would confine what you have to say to the bills which are now before Parliament?—I will take this case. Suppose that an application of a similar kind was made, and it was known that the 100,000*l.* which the company proposed to raise is not to be spent in cleaning the ground and stocking it, but that it is the intention of the company to spend from 70,000*l.* to 80,000*l.* out of the total capital in works, such as the building of piers and railways, then I should say that the remaining 20,000*l.* would be very insufficient, after paying the expenses of the Act of Parliament, for stocking the ground, and doing the work necessary to be done upon it.

61,669. You would take that as a *primâ facie* case that the company did not intend to do what they professed to do?—Yes, they could not do it. With regard to the hot-water scheme, I always regarded that as absurd, and Mr. Croft, who was the patentee of that process, has not I believe proceeded with his patent. Indeed, I believe that part of the Herne Bay bill in the present session is to enable them to withdraw all those clauses from their scheme.

61,670. There are two bills proposed before the House now, one of which is the extension of the powers of the Whitstable Company, and another the extension of the powers of the Herne Bay Company?—Yes.

61,671. What objection have you to those bills?—I have made different inquiries with regard to them, and I understand that the Whitstable Company is applying for its bill on the ground of self-defence. The argument, and it appears to me to be well founded, is that Parliament, having sanctioned the granting to a private company of this large tract of the flats upon which the spat has hitherto fallen, and most of which must obviously have come from the Whitstable and Faversham grounds, cannot refuse the same privileges to them. Hitherto they have been compelled to buy as it were their own spat at a price which has been fixed by public competition. They have had to buy their own spat from the free fishermen in the mouth of the Thames, and the price has to some extent been kept down; but now if this common land is to be enclosed and handed over to a private company, they will be subjected to a certain extent to the monopoly of that private company, and will have to buy their own spat back from the Herne Bay Company. Therefore they say, "as Parliament

LONDON.

Mr. J. Lowe.

25 March 1865.

" has sanctioned the granting of a portion of this " ground to a private company, they cannot deny us " the grant of a further portion of it." As I understand there is no intention whatever on the part of the Whitstable people to cultivate a single oyster on the ground they apply for except colourably. Indeed it would be absurd to suppose that they could do so, for it is at least a dozen miles from their own ground, and they would have to organize a fresh fleet of boats, and to take steps which it would be absolutely impossible for them to take. They are really applying for the common land in order to enable them to dredge for spat. They say " you have established this principle in the " case of the Herne Bay Company, and you cannot " deny us the same rights." It is bad in principle, but having been already recognized by Parliament I think they are right in the claim they make.

61,672. (*Mr. Lefevre.*) The two cases are somewhat different. The Herne Bay Company profess that it is their intention to cultivate the ground for oysters, but the Whitstable Company do not profess that?—The Herne Bay Company have professed a great deal, but as they have performed nothing, I think you ought to attach value to their promises in accordance with the manner in which they have performed them.

61,673. You are aware that the operations of the Herne Bay Company have been to a certain extent impeded by legal questions raised between them and the Crown as to the rent they shall pay?—I know there have been legal questions raised, but I think they have been still more impeded by want of capital.

61,674. And also by the difficulty of procuring spat to lay down?—No doubt.

61,675. So that last year would hardly be a fair year to judge of the operations of a private company of that kind?—Quite true; but if there had been any amount of spat in the market, I do not think the Herne Bay Company would have been in a position to have laid down many oysters there. The promoters of the bill declared in the House of Commons, in answer to a question put to them, that nearly the whole of the capital had been subscribed; but four months after that the directors acknowledged at the first meeting of the shareholders, that only a quarter of the capital had been subscribed. As the capital is fixed at 100,000*l.* you know what would be left for stocking the land and carrying on the works after paying the expense of promoting the bill in Parliament.

61,676. (*Professor Huxley.*) Do you object *in toto* to the principle of granting to companies rights over the fishing on certain parts of the foreshores for the purpose of cultivating oysters?—My own opinion is, that if it can be shown that a valuable public right already exists, the allegation of any private company or persons that they can do better with the land or make it more profitable should not cause that land to be confiscated.

61,677. Is not that which should rule these things, in the long run, the interest of the consumer and the general public?—Yes, within bounds. I do not think, for instance, that if a market gardener said " I can grow " more potatoes in your private ground than you can, " that would establish his right to have it handed " over to him." If it can be shown that a valuable right exists, and that the public of the neighbourhood are deriving a considerable income from it, I do not think that any argument of that kind ought to cause Parliament to hand it over.

61,678. Take the case of a common on which there are a few donkeys grazing, and where the right to the common may be worth a few shillings a year to the poor persons in the neighbourhood, and that it could be demonstrated that, by enclosure, the common would yield a considerable quantity of wheat, would not that be a ground for compensating the persons who would suffer in some fair and reasonable way, and then turning the common to account?—In the first place I do not think that that is a parallel case.

61,679. But let us have your opinion with regard to the principle first?—It would depend altogether upon the value of the common to the public. It might be that the value of the grazing of the donkeys would only be worth a few shillings, but the advantage of the common and the fresh air there might be of considerably more value to the public, so that they might have a fair right to say that it should not be enclosed.

61,680. That alters the question.—The case in this individual instance is not the case of a few shillings a year, but of a fishery worth 20,000*l.* a year to the public in the neighbourhood. It is proposed that that should be handed over to a company with only a capital of 100,000*l.* to work it with.

61,681. Is it not always possible, however much private persons may get out of a given area, whether of sea or of land, that by conferring upon a body with capital a certain right over that area, very much more might be made out of it, and more employment given to the public and more money spent among the people of the neighbourhood, so that they would become really benefited by the change?—Yes.

61,682. There is always that possibility?—Yes.

61,683. You would not in similar cases absolutely deny to Parliament the power to make a grant of such ground, but would rather require that evidence should be given to show that the ultimate benefit would make up for the loss?—It is impossible to answer a question of that nature shortly, but I will say that I think the principle, as you put it, is a mischievous one.

61,684. I wish to know if that really is so?—I think it is a mischievous one, although I do not say there might not be an infinity of exceptions.

61,685. Is not that the principle upon which all compulsory grants for railway purposes are made?—Yes, and at the beginning of the railway system no one complained more loudly of it than the landowners.

61,686. Just so, but is not that at the bottom of the granting of rights by Parliament to companies?—It is a question of degree altogether.

61,687. Not the absolute value, but the relative value?—Yes; for instance, if it were a comparison between the value to the public and the advantage obtained by the public in the way of health, then the health of the public should be supreme.

61,688. But if the Herne Bay Company or any other company are enabled to give more employment to the people of the neighbourhood than they deprive them of, would not that be a compensation?—Certainly not; for example, over the flats in Herne Bay before the passing of this bill there had been working at a moderate calculation from 200 to 300 fishing boats; each of them had a man and a boy, or a man and two boys, or two men and a boy. Those boats came from Queenborough, Whitstable, and Leigh, and all parts of the estuary, whereas a private company would at the outside employ only a dozen or 20.

61,689. (*Mr. Lefevre.*) Those boats come now only occasionally?—They come regularly all the year round. I am told that the cod fleet that fishes on the Dogger Bank buys from the fishermen of the estuary of the Thames about 8,000*l.* worth of whelks every year for the cod fishery, and I believe that the majority of those whelks are caught off this very ground.

61,690. The flats fished over extend over an immense area of ground?—Geographically speaking the flats are very large indeed, but for oyster-fishing perhaps they are very small in extent, and the most valuable part of them has been taken by the Herne Bay Company.

61,691. (*Professor Huxley.*) Supposing that the fishermen have obtained an income of say 8,000*l.* a year from the flats which are now confiscated, would it not be worth while for the Herne Bay Company, or anybody who possesses that ground, to obtain the same revenue in the same way, and to pay the fishermen equivalent wages?—I do not think they can, for the reason well stated by a former witness, that a joint-stock company would not be able to employ the same number of boats. At present there are from 200 to 300 boats working over the ground, but the Herne

Bay Company would never employ that number of boats.

61,692. (*Mr. Lefevre.*) But might they not do it in some other mode? Might they not license boats?—They never would. In the evidence of Mr. Ffennell before the committee of the House of Commons, he thought it would be improper to reserve to the fishermen of the Thames the right of trotting for whelks, on the ground that it would be injurious to the oysters.

61,693. But if there is a valuable oyster fishery established there like the Whitstable oyster fishery it would be more valuable to the public than if the ground is allowed to remain for the cultivation of whelks?—They cannot make a valuable oyster fishery there.

61,694. That I think is really the point in dispute between you and the Herne Bay Company. They say they can make a productive oyster fishery of it, and you say that they cannot. Is not that so?—That is one of the points.

61,695. Supposing that in any of these public grounds you could ascertain who the fishermen were who had been in the habit of fishing there, and could incorporate them, and make as it were the fishery a private property for that company of fishermen, would they not readily accept the change, and would it not be of more benefit to the public generally than by leaving the ground open to the public as it is now?—I think it very likely that they would accept it, and as far as my opinion goes it would be better that it should be so than that the ground should be handed over to strangers. If anybody is to benefit from a monopoly it should be the people of the neighbourhood, but I would prefer to leave it open to the public.

61,696. If that were done would there not be a larger produce from the ground?—Of course if a man had an allotment on a common he would cultivate it, and increase its value.

61,697. The result would be a larger produce from that piece of ground?—Yes.

61,698. By the cultivation of the spawn would not a great deal more be got off it than at present?—I have some doubt of that. The bill abolishes all forms of fishery but one, and I do not know whether they would be able to make 20,000*l.* a year, assuming that to be the value of the fishery at present.

61,699. Putting aside the case of the Herne Bay Company, let us take the case of that piece of ground which lies between the ground of the Herne Bay Company and that of the Whitstable Company?—That small piece of half a mile?

61,700. Yes. By converting that into a private property and cultivating it, would there not be to the public a great deal better produce than there is now?—There is a peculiarity about the Whitstable ground on one side, and the other ground on the other. Whitstable is peculiarly situated. You spoke some time ago of the spit of sand running out there. Now that is not sand, but it is a natural breakwater composed of clay, stones, and shells. It is a natural breakwater, and it shelters Whitstable Bay from the east, producing that tranquility which is essential to the successful cultivation of the oyster. As to the land to the east of Whitstable Street, which is the name of that spit, I do not believe, and it has yet to be demonstrated to my satisfaction, that it is possible to cultivate a strictly marketable oyster in the proper sense of the word on that land. You may do what you like with that ground but I do not think that you will ever get a fat marketable oyster from it; it is open to all the east winds, and it has a shifting bottom. You have only to look at the shore and the cliffs to see how the east winds which prevail silt and shoal up that loose bottom. The shore has to be protected by groins from being torn to pieces. The only oysters I ever saw dredged off that ground were poor, small stunted oysters.

61,701. Then I understand you to say that east of that spit of sand there cannot be a cultivation of oysters in the strict sense of the term?—In my opinion decidedly not.

61,702. Supposing that the cultivation were possible along that piece of ground, would it be more beneficial to the public that it should be cultivated or kept open?—That would be a question of degree. If it were shown that there was a valuable fishery open to the public and worth 20,000*l.* a year, I do not think that any calculation or advantage ought to induce Parliament to confiscate it.

61,703. (*Professor Huxley.*) Not if you could make 100,000*l.* or 200,000*l.* from it?—No, not unless you could guarantee that the men who now get their living from that ground would be compensated for their loss.

61,704. (*Mr. Lefevre.*) I suggested that by supposing there might be some incorporation of the fishermen who had been in the habit of fishing there?—They have been fishing there ever since the Conquest I believe.

61,705. I have suggested a mode of meeting that difficulty by incorporating the fishermen and giving them on that ground an exclusive right of fishing, something in the mode in which the Whitstable fishermen have a right to their ground. If that were done would there not be an advantage to the public generally?—I believe that the Whitstable fishermen derive their privilege from an ancient charter.

61,706. That amounts to the same thing as an Act of Incorporation incorporating the fishermen who have been in the habit of fishing there?—Yes.

61,707. And giving them the profits of the labour expended on the ground?—I am not going to defend the system of the Whitstable Company; I believe if their ground had been open to the neighbourhood it is possible that the oyster beds would have been got into quite as good a condition as the Whitstable Company have got them into.

61,708. Do you think that by throwing the ground open to the public generally, so that anybody might fish there, anything like the same quantity of oysters would be found?—There would not be many laid down. The same amount of stock oysters would not be purchased, but I do not know that the actual result would not have been the same.

61,709. Do you think that the prospect or possibility of getting a spat once in seven or eight years would be anything like as valuable as what is done there now?—There might not be the same amount of oysters.

61,710. (*Professor Huxley.*) Upon what principle of English law or custom would you give the inhabitants of the neighbourhood an indefeasible right to the produce of the sea in any particular locality?—I do not say that they have a complete right, but in all cases when commons have to be enclosed it is always understood that the neighbourhood should have its rights considered.

61,711. Is there anything at the present moment which prevents persons from any part of England from coming and dredging to any extent they please on these public grounds?—No.

61,712. Is it not possible for the shipowners at Hull to send vessels down to the common ground off Whitstable and dredge it as nearly bare as possible?—Yes.

61,713. So that the law admits no right on the part of the inhabitants of the neighbourhood?—But if it was proposed to enclose that ground, I apprehend that the voice of the people of the neighbourhood would be heard in preference to that of strangers.

61,714. If a man living anywhere in England, as has happened on other parts of the coast, were to send down a steam dredge, and to clear away every oyster he can find for his own purposes, he could do so?—Yes.

61,715. Then in that case he would clear away so much of the means the immediate neighbourhood have of obtaining a livelihood?—Yes.

61,716. And there is nothing to stop him either by law or by custom?—No.

LONDON.

Mr. J. Lowe.

25 March 1865.

61,717. So that the law does not recognise the smallest right of property in the produce of the sea?—No.

61,718. The question is as to the general abstract rights. You are of opinion that the fishermen have a right to the foreshore for themselves and their heirs for ever. That, however, is not recognised by the English law, but the law admits that every Englishman has as much right to clear away the oysters from these particular grounds as the inhabitants of Whitstable and the neighbourhood?—That is so, but practically it would be almost impossible to do that, although there is no doubt that an oyster-bed has been dredged up and taken away. I remember an instance in the neighbourhood of Alderney in which a large oyster-bed was completely destroyed in that way in a short period.

61,719. We have had cases of that kind brought before us?—But in this case the neighbourhood practically has obtained a living off the ground and so far there has been nothing to tempt the steam dredge to come, nor could it have cleared the ground if it had come. In point of fact, it would be impossible to destroy it.

61,720. I put the case to show you that there might be a strong argument made out for giving grants to private companies in order to preserve the fisheries for a neighbourhood; that being the only means of doing it. You see it is quite possible to turn the argument round?—Yes.

61,721. Therefore we have to consider that question as well as the other which you have raised?—Yes, I should like to make an observation with regard to the French process of oyster culture of which I have seen something. The gentleman who was last-examined seems to have made some experiments in which he failed and from that he seems to have drawn the conclusion that all the different processes which have been tried are to be regarded as failures. Now I have seen them at work and successfully.

61,722. What part of France do you refer to. Do your remarks apply to the Isle of Re?—No, I did not go there. I went to the Baie de Forey, where there is a great nursery for oysters. A large oyster park has been established there at considerable expense. They rear the oysters and distribute them among the cultivators from the Isle of Re and along the coast of the Bay of Biscay. The only system in practice now in France is the tile system. All the others have been abandoned, but the tile system is largely practised in the Baie de Forey. There I saw the oysters myself. They attach themselves to the tiles which are coated with a kind of cement. The tiles are laid on that part of the shore called ebb-dry, between high water mark and low water mark; I believe they are never placed below the lowest low water mark. At the Baie de Forey a portion of the ground was exceedingly muddy when they began the experiment, but the gentleman under whose able superintendence the works were carried out, informed me that it was by the tiles themselves that the shore was cleared of mud. They were so arranged that little rills of water passed under the tiles forming a current which swept away the mud. I see from M. Coste's own report of what is going on in the Isle of Re that exactly the same thing occurred there. What would be the effect of putting the tiles below low water mark where they would be always covered with water, I do not know, but by the arrangement of the tiles as I have described, it seems that the shore may be entirely cleared of mud.

61,723. In what way were the tiles disposed?—In various ways; that depends entirely upon the configuration of the shore.

61,724. Have they no special rule upon that matter?—No, it depends entirely upon the locality itself. It may be advantageous to lay them in one way in one locality and another way in another locality.

61,725. From what you have seen are you inclined to believe that that mode of catching oyster spawn is useful and profitable?—Yes; I do not know whether it would answer in England. I saw some tiles the other day which were shown to me by Mr. Mitchell the secretary of a company in the neighbourhood of Southend, who are acting without an Act of Parliament, and I counted 16 spat on one tile.

61,726. Was it obtained in the neighbourhood?—Yes, on the Essex coast; and as this has been a very bad year for spat, I should argue that if you got tiles with spat upon them under such circumstances, in a good year you would have more success. At the same time I may say that the success of the French process has not been demonstrated, so far as I am aware of, on any part of our own coast.

61,727. Have you been as far south as the Bay of Arcachon?—No, I did not go so far as that.

61,728. (*Mr. Lefevre.*) Can you give us any idea as to any mode by which the oysters may be increased in the mouth of the Thames generally? Have you any suggestion to make on that point?—No. Assuming that the French process has succeeded it could only be carried out on the foreshore and not in deep water. It might be advisable to grant portions of the foreshore for that purpose, either to private individuals or to a company. The outlay would be exceedingly small. By that means tiles might be laid down in favourable spots which would collect spat that would otherwise be destroyed. In that way the spat instead of being destroyed would go to the enrichment of the estuary. At the same time I am not aware of any process whatever, whether by hot water or by Act of Parliament by which a spat could be created where no spat naturally exists.

61,729. Would you be in favour of granting a portion of the foreshore of the estuary of the Thames for that purpose?—Yes, on any part of the coast where the fishery would not be interfered with. If it can be shown that the French process is successful, I think that the utmost amount of encouragement should be given to individuals or to companies to adopt that process for the purpose of increasing the spat.

61,730. But you would not grant land for that purpose, where the right of public fishing already exists?—No, in that case I would leave it alone.

61,731. Would you make any regulation as to the size of the oysters to be dredged up on the flats or elsewhere?—I think that is a matter which might be left to the oyster dealers themselves. If they brought in oysters too small or too large they would not be able to make a market of them.

61,732. You do not think it desirable to require oysters of a certain size to be left on the ground for the purpose of breeding?—I think the fishermen would be the best judges of that themselves. Of course if you granted portions of the foreshore for the encouragement of oyster breeding, you would have to give a right in the oysters.

61,733. But on the public grounds would you enforce a regulation as to the size of the oysters to be dredged?—I think not; I do not see how you could enforce such a regulation.

61,734. You could enforce it, because it is enforced in the Channel now?—It may be enforced on the company's ground, for they have receivers, and when the fishermen bring their stints home they are examined, and I believe they have a kind of ring, through which the oysters are passed.

61,735. But on the flats would you restrict the taking of oysters below a certain size?—I would prefer not to answer that question; I have not thought of it.

61,736. Is there any provision in the Herne Bay Company's Act, that they shall raise a certain proportion of oysters per acre?—I am not aware of any provision of that kind.

The witness withdrew.

JONATHAN RUSSELL called and examined.

LONDON.

J. Russell.

25 March 1865.

61,737. (*Professor Huxley.*) You are the agent of Mr. Wills?—At the present moment, I am carrying on a fishery for him in the Stour.

61,738. Have you been long acquainted with oyster fishing?—Yes, all my life.

61,739. You have heard the greater part of the evidence which has been brought before us to-day?—I have.

61,740. Is there any part of that evidence which you would wish to comment upon or supplement?—There is a good deal of it from which I differ, but perhaps you will allow me to begin in my own way. I do not think it necessary to say much about the breeding question; doctors differ about that; but what I wish principally to call your attention to is the close-season. I am about to cite certain instances to you, and if you wish for further proof you can follow my statement up by evidence from the neighbourhood. The first ground I remember under the free system before the Convention Act was passed, was the ground in Langston and Chichester Harbour. In that place there were immense quantities of oysters always produced and there the fishermen had an agreement among themselves that they should cease working towards the end of May, and begin working again about the middle of July. Under that, which might be called a free system, the oysters were never known to flag, but there was always an immense quantity to be had. Half the supply that came to London of what was called Kelleys or a second sort of natives came from there, but since the Convention Act came into operation and restrictions were adopted with regard to working on the ground there have not been half so many fishermen as there were formerly, and the stock of oysters has failed entirely.

61,741. To what do you attribute that?—I attribute it to the loss of the ground, in consequence of its being over-run with vermin and covered with slob, owing to its not being worked well in summer. The same remarks will apply to Falmouth harbour and the bays of Arklow and Wexford. In those places there has been a loss of ground and oysters from the same causes, although the fishermen have increased there in number, but that has not been in consequence of any increase in the oyster fishery, but because they have gone after herrings and floating fish; in point of fact their ground has almost been lost. When first I went to Arklow to purchase oysters, I could purchase as many as I pleased for a shilling the herring barrel, holding 37 gallons; now you could not get any at any price; there is no quantity to be obtained and the stock has been dying away every year until it became almost nothing.

61,742. (*Mr. Lefevre.*) When were you last at Arklow?—Twelve months ago. The prices have greatly gone up. As I just told you, I have purchased there for a shilling a bushel many hundreds of thousands of oysters. The boats could catch 100 bushels in five hours, and now they could not catch 100 bushels in a month. The number of boats has increased there because the fishermen have turned their attention to the herring fishery. I brought about a reformation in the mode of dredging. They used formerly to dredge like the Frenchmen, by throwing the dredge overboard and allowing it to remain in the sea for an hour, bringing it up then full of oysters. I made them use a smaller dredge, after the English fashion, and they adopt that system now; but ever since the restrictions were enforced the oysters have gone away. It has been the same in the Jersey Roads on the Gorey side. Before the restriction adapted by the States with regard to the oyster fishery there was an immense amount of oysters; the fishermen used to work in all seasons except for a few months in the year, and they were able to obtain an enormous quantity, but the States passed a regulation shutting up the ground from the last day of April to the first of September, and the fishery has failed ever since. It has been the same in the Bay of Cancale. The Frenchmen tried years before there were restrictions here to restrict their own fishery. English boats used to go into the Bay of Cancale and work there, and they could get 100 or 200 bushels of oysters in a night. Whole fleets of boats worked in that place, but since the Convention Act has been enforced that fishery has nearly failed, and I attribute the failure to the oysters not being properly worked. It has been the same in the Bay of Granville, and all up and down the south coast of England. When I was young and in business there was an ample supply of oysters from one end of the kingdom to the other. Upon the grounds on the eastern shore the boats used to work for supplying private beds in different places in the summer, and there was always plenty of oysters to be had on all the spots they worked, but since the Convention those grounds have not been worked. The fishermen cannot work them in the winter, and in the summer they are not allowed to do so; the consequence has been that those grounds have been entirely lost. You could not find an oyster upon them now. The same has been the case in the Bristol channel and at Milford Haven. Those are the observations I wish to make with regard to the close time, and what I think would reinstate the oysters is to abolish the restriction altogether as to the time of working, but to put a restriction upon the selling of oysters for the market. I would require that no oysters should be brought in the summer months into the market for sale; they would only be caught then to supply the private grounds exactly at a time when they are wanted. That would keep the ground open, and it would bring the stock back to its original standard, in my opinion. As to the spawn of the oysters, one or two of our friends here have said a good deal about that question, but I would say, as the result of my own observations, that there are only 10 out of every 100 that spawn every year. If you take 100 oysters and open them, you will find that they will not average more than one in 10 in the worst milky times. If you take them all through the breeding times you will find that the average as near as you can fix it is about 10 in 100. There will be 90 oysters out of every 100 that will be as good and fit for food as ever they were, while the rest will be spawning. Mr. Smith told us that the oysters will breed when two years of age, but never in the course of my observation did I find one breeding at so young an age. (*Mr. Smith.*) I have seen the sickness coming from them at that age. (*Mr. Russell.*) As to the French, it is said that they have invented something new, but in my opinion they did not know what the system here was. All they have done has been done in England longer than the oldest inhabitant can remember.

61,743. (*Professor Huxley.*) The system of using tiles has not been tried here?—The system is simply the old mode of using culsh. We take a piece of ground, clean it, and cover it with culsh. That the Frenchmen use tiles I give them credit for, but they have not discovered any mode for the artificial breeding of oysters. The ebb-dry grounds are not as a rule good for spat, but they are very good for laying down oysters for the market. As a rule they do not produce a great number of spat. We prefer deep-water, from 10 to 18 feet, where the beds are never dry, and those beds we find the most prolific. We cover the ground well over with culsh. Upon a piece of ground covered with mud or clay we should not be able to find a spat, but when it is cleaned and covered with culsh we should. I do not believe that the French ever breed any bulk of oysters. There are many things in the book of M. Coste which I could prove exist only in his imagination. I do not believe that the French ever bred 10 tubs of oysters in their lives. We find that in the French markets there are a good many oysters sold for consumption, but they do not get them now on the coast of France. Originally they used to get them from Granville, St. Brieuc, and Cancale, but they do not get them

LONDON.

J. Russell.

25 March 1865.

now. Those grounds have failed, and have become covered with five-fingers and slob. There are no places for the oysters to settle upon now, and they have to come to England to get their stock. They are in every market in England buying their stock. If they breed the immense quantities they say they do why do they not send them to the market? Notwithstanding all M. Coste's calculations, you cannot find out where he has sold the immense supply which he pretends to have produced. If they have so great a supply there, why do they come here and pay prices that were never heard of before? They go to Arklow, to Falmouth, to Shoreham, to Newhaven, to Wexford, and other places, and they pay fabulous prices for oysters.

61,744. We are informed that they do not profess to realize more than 5,000*l.* a year by the oysters from the Ile de Re?—No. (*Mr. Smith.*) I can quite confirm your remarks in reference to the production of oysters on the French grounds. (*Mr. Russell.*) Now I could go upon any ground and pick up a piece of culsh with perhaps 50 or 60 spat on it. I might then say I have 20 acres of ground and all the stones I have on that ground are in the same state. Then I calculate how many stones I have and I take it for granted that that is the number of my stock. That is the way in which the French people have calculated. In our places here we can go upon the ground and find stones covered with almost any number of spat. Sometimes I have found spat so thickly clustered together that it would be impossible to count them unless you marked them. If I were to say I have so many stones on my ground and they are all in the same state, and if I were then to make a calculation in that way I could easily show the same figures as M. Coste, but the probability is that I might not find another stone on the ground like that one. There is a great misconception with regard to oyster dredging in France, and as to granting large tracts of the public grounds to private companies I do not object to it myself in any way except that it will destroy the fishermen. That it certainly will do if it is carried out to the same extent that it has been carried out in Herne Bay. I do not think that the Government nor any one else should restrict whelk fishing or fishing for floating fish upon those beds, because I believe that instead of lining or dredging for whelks over the oyster beds doing any injury, that it is quite the contrary. I think the fishermen at every oyster fishery should be allowed to fish for whelks so long as they do not disturb the oysters. I do not say that they should dredge, but they might use both the line and the net. If these grounds are to be made valuable, and if these private companies mean honestly they must employ fishermen to work them, and I think they ought to be required to employ a proportionate number of men to that which is now employed on the ground they desire to take; Parliament ought to lay that down as a rule.

61,745. Is it necessary that any grant should be made beyond the limits of the foreshore for the successful cultivation of oysters?—Yes, you must go into the deep water if you are going to cultivate oysters. My father's place was one of the most beautiful ebb-dry grounds in the world. It was at the head of a salt-water lake that runs towards the sea into the harbour. My father had it for many years; my brother has got it now. There were about four feet of water over it at the time he first got it, but by levelling it and improving it he got an uniform depth of two feet, and the tide runs over the ground at about three knots an hour; freshets also come down and give it just sufficient fresh water, but although 20 bushels of oysters were lying there, on the average, no spat was ever found there, but immediately below in the deep water any quantity of spat could be got.

61,746. Below that ground, was the ground public?—Yes.

61,747. Could you not get enough spat by fishing to supply it?—Yes, but it would have been very profitable if we could have extended our rights half a mile further down.

61,748. (*Mr. Lefevre.*) Where was that ground?—At Langston harbour; New Milton it was called. We were attacked there by the fishermen in a body after we had held the ground for forty years.

61,749. (*Professor Huxley.*) Were you forcibly attacked?—Yes by 200 fishermen in boats, and I want to call your attention to the inefficiency of the laws in that respect. I will do that by-and-bye. Something was said by Captain Austin about the spawn not living in stagnant water. I think he is quite mistaken, and when you are down at some of the places I am about to mention, you can verify the truth of my remarks by your own observation. You will find in the steam basin at Portsmouth, when they run the water off, the wall covered all over with oysters a foot or two below the level of the water in the basin. In Ramsgate basin the same may be observed. Now those places are stagnant; there is no current passing through them at all. At Cherbourg, and in the inner harbour at Dieppe the same may be observed. At Emsworth they supply a bath or a kind of stagnant pond with salt water; they pump the water both in and out of the bath, and yet that place is covered all round with oyster spat. You will also find a remarkably large number of oysters all under the arches of the royal dock at Grimsby. I never saw so many in any place. All the walls are built on arches, and when they run the water off you can see under them, and you see an enormous quantity of oyster shells where the boys have got down and opened them as they stuck on the walls. I have found the same thing in regard to every dock I have seen elsewhere, and that I think is a convincing proof that oysters will live in stagnant water. (*Mr. Smith.*) I can confirm the remarks made by Mr. Russell. We put them in pits in the spring, and if there happens to be no market for them until next season, when we go to them then, we find them in a much better condition. (*Mr. Russell.*) I think the facts I have mentioned form a convincing proof that oysters will breed and grow in such places. There is another place to which my attention was called in my early youth, and that is the canal that was cut from New Milton to Portsmouth, through a portion of the ground of Langston harbour. They pumped the water into the canal, and ultimately, when it was allowed to run dry, there were millions of oysters in different stages of growth found there.

61,750. Was the spat pumped up?—Yes; but the canal was a perfectly stagnant pool. Every bridge, every buttress, and every pile in the canal was covered with oysters. You may see the white shells sticking there now. There were more there than ever I saw anywhere, except at Grimsby. At Grimsby there was an immense number.

61,751. Have you any remarks to make with regard to the protection of the oyster beds?—I have experienced the want of protection two or three times in my lifetime. I have always had to do more or less with the oyster trade, and the first time I found the oyster Acts not sufficient to guard us, was upon my father's ground. He held a lease from Lord Keith. He ran out the first lease, and was into his second, when some little political difficulty arose between the then landlord, Mr. John Deverill and Mr. Hector, M.P. for Petersfield. It was enough to breed ill-blood between them. Mr. Hector used to have a good deal to say about the fishermen, and by some means a notion got out that the fishermen could come on our ground and do as they pleased; they therefore organized an attack. They gave us notice that on a certain day they would come *en masse* to try the right. We pooh poohed the idea; we could not believe in such a thing; but sure enough, on the 1st of September, they did come, 200 boats of them, with two men in each boat, and made an attack upon the beds. I was the only person there, and I managed to drive them away; they were afraid that I would shoot them, and they ran way. I then procured the assistance of

the police, and I got some of them taken before the magistrates and committed, but when the case came on for trial they said they had not acted with a felonious intent, that they only came there to try their right to the ground, and although each one loaded his boat and carried away 10 bushels of oysters before he went away, the jury would not find them guilty. They came there again two or three times, and the magistrates refused to commit. We were powerless, and they cleared out every oyster. Since then there have been attacks made in the same fashion on several other grounds. I took some ground in the Menai Straits from the Woods and Forests and I worked there for three years. There had never been such a thing as an oyster fishery there before. The Welshmen were annoyed to find that a foreigner, as they called me, could go upon their ground and make such an immense trade out of oysters. I used to send across to Arklow for oysters. I got them for a shilling a bushel, and I brought them over for another sixpence a bushel. The ground suited them very well. They came off first rate, and there was no limit to the market. I was making a very large trade there, when the Welshmen, annoyed to find that they had never known the value of the Menai Straits, although they had been living there all their lives, organized an attack. They sent round notices, and had them stuck up, that they were going to try their right to the open sea. Placards were posted in every direction. Eventually, one fine day, they did come, about 150 boats of them, with flying colours. They made an attack on the ground. I got Sir Richard Balkeley, the lord lieutenant of the county, to interfere. He ordered a lot of them to be taken up, and they were brought before himself, Colonel Pennant, and other magistrates, and committed to the assizes for trial; but at the assizes the bills were ignored against them, and they came upon the beds again and worked there until they cleared the whole of the oysters out. I got injunctions, but they worked on in spite of them, the Lord Chancellor making some excuse that it was an *ex parte* injunction. So they went on until I was entirely beaten.

61,752. Your complaint is not so much with regard to the law as in reference to the administration of the law?—It is the law I complain of. The oyster Act says that it shall be done "feloniously," and that very word condemns the whole thing. They gave notice that they intended to come and try a right, and it was held that there was no felonious intent.

61,753–4. (*Mr. Lefevre.*) Had you a grant of the soil?—I had a lease from the Woods and Forests.

61,755. If, after the right had been established, they came again, the case would have been different?—That was the result, and that is the way in which the law stands at present. It is totally powerless to protect oyster grounds.

61,756. It seems to me to be the fault of the magistrates?—No. The point upon which they got in was in having informed us that they only did it to try a right.

61,757. That may be very well the first time, but if the right was established in a court of law by an injunction, or by an action for trespass, then the next time it occured the magistrates would not be justified in refusing to commit?—They can do it every day in the week, and I could not check them on the Bangor grounds.

61,758. (*Professor Huxley.*) Did you give it up?—Yes, in the Menai Straits; but on my father's ground we managed to beat them by a side wind, and we still hold the ground; but it was only by a side wind. The law says there must be a felonious intent, and what these fellows say is, "We do not come for the sake "of the oysters, but to try our right." But they carry out their idea of trying their right until they carry away all the oysters. The ground was so exposed that a fleet of 100 boats could go upon it, and after working for three or four hours go away with a boatload each. I believe they attacked the Chieney Rock ground in the same way, and they lost an immense quantity of oysters before the depredations could be stopped. Also down at Illford they carried away an immense quantity of oysters from the ground which Mr. Tyke leased under the Duke of Leeds.

61,759. Taking your own case at Beaumaris had there been oysters laid down there before you went?—No, there never was an oyster ground there before; there was not an oyster in the river.

61,760. Then it was not known that oysters could be laid down there?—No, the Welshmen did not know that anything of the sort could be done.

61,761. They said when they saw you doing it that it was a public right?—They knew perfectly well what I was doing, but there happened to be a clever lawyer there who saw exactly how the law could be cheated and acted upon it. It is impossible under the present law to get a conviction. You may depend upon it that you are altogether as powerless as though there were no law affecting the question at all. I tried the question under a second Act of Parliament, which says, that although people may go upon the oyster beds and dredge and disturb the oysters they are not to take them away, but they proved that they did take the oysters away, and they beat me there. What I want is to see some law passed simply to meet this case. Mr. Goody of Colchester told me the other day that he is going to get up an attack upon my ground in Essex, and that some of the fishermen there are going to take all our oysters. I believe they will do it if they are bold enough, exactly the same as they have done before.

61,762. You have got a grant from the Woods and Forests of the bed of the river?—Yes, for the purpose of an oyster fishery, and there never was an oyster fishery there before. There never was an oyster fishery above Strattonness. We are, however, in a somewhat better position there as there is a guard ship which can raise force enough to capture all the fellows who come. In the other cases we were away from everybody, and could not get anyone to take hold of the mob of fellows who came upon us. At New Milton we were a mile away from any habitation, and it was not likely that a single individual could stop a mob of 400 men.

61,763. (*Mr. Lefevre.*) You are talking now of Langston Harbour?—Yes.

61,764. Are there any private beds there besides those you have been speaking of?—Yes, there are several.

61,765. Do the owners of those beds purchase oysters for fattening?—Yes, there are persons there who act as a kind of middlemen between the fishermen and the people who send to the London market. Our trade was to buy small oysters, to lay them down for one year, and then sell them to people from Whitstable and other places, who bought them to lay down for another year, after which they would go to the London market.

61,766. Has that trade been done away with in consequence of the Convention?—Yes; we used to buy and send away small oysters principally in the summer—in the close-season. Now, we have no chance of getting them, and consequently the oysters and the ground we got our stock from have perished together.

61,767. Is your trade confined to getting larger oysters, and keeping them for the market?—Yes.

61,768. Do you supply the London markets during the summer?—Yes, by rail.

61,769. So that the London markets do get supplied?—Yes, by rail.

61,770. During the whole of the year?—Yes; we buy enough in the open-season to last during the whole of the close-season.

61,771. The whole of the close-season?—Yes, and those oysters are sent to London by rail; hence they avoid the restrictions with regard to the sale of oysters in London. All the laws for London are made for oysters that come up to London by water.

61,772. Does the price vary very much from that which is paid during the winter?—There is very little difference; it is about the same.

LONDON.

J. Russell.

25 March 1865.

61,773. Of those which you send to market at that time about 10 per cent. are unfit for food?—Yes.

61,774. The rest are fit to eat?—Yes, they are as good as at any time of the year.

61,775–81. (*Professor Huxley.*) We took evidence at Arklow last year, and they made statements to us very different from those which you have made to-day. For example, one of the witnesses, Thomas Colvin, a fisherman, was examined, and this was his evidence:—"Are there plenty of oysters to be found "here?—Yes, there is a good supply indeed. Does "the supply keep up?—Yes. Is it as good now as "when you first knew it?—Yes. There has been "no falling off?—No, I do not think there has been "any falling off. Has there been any increase in the "supply?—I rather think the oysters have been "scarcer in former times than they are now." You do not agree with that statement?—No, I think it is very wide of the real facts of the case. How old was that witness?

61,782. Here is one of the first questions we put to him: "For how many years have you been fishing "here?—For about 44 years." In reply to the question: "So that you have had from 40 to 50 boats "working for 30 or 40 years, and working for every "season, and the supply of oysters has kept up?"—He said "Yes, I have seen a time when we could not "get 100 shot in a fishing, and now we get some-"times 3,000 shot." Do you agree with that?—No, I think he spoke very wide of the truth, because at one time in Arklow Bay, immediately outside the bar, I was able to take a vessel capable of carrying 800 tubs of oysters, and boats would go to work close to where the vessel was riding and would load that vessel before night. I have loaded six vessels there in a very short time.

61,783. How many years ago?—I am speaking of 1848 and 1849.

61,784. How many years ago is it since you last obtained oysters there?—The last time I fished oysters there was in 1853, and then there had been a great falling off. I used to buy them there every year for the purpose of stocking my beds in the Menai Straits. At one time I got them for a shilling a tub, and I could get as many as I liked at that price; indeed I could get more than I could lay down in 1851, 1852, and 1853. When I last bought them I gave as high as four shillings a bushel for them.

61,785. That is capable of being reconciled with the statement here, because the witness when asked how long the scarcity lasted, said he had not seen any scarcity for the last 11 years?—There is a scarcity now; you cannot buy oysters for love or money.

61,786. (*Mr. Lefevre.*) Is it not rather a question of price. The price is very high?—There are none to be had. If you had asked Captain Austin he would have told you that it was not worth while sending to Arklow, because there are no oysters to be had there. The Whitstable people would be glad to buy them there if they could get them.

61,787. They would only buy small oysters?—They would buy them big and little. If there were oysters to be had there, there would be a drain upon that place within a month of at least 700, or 800, or a thousand tons.

61,788. (*Professor Huxley.*) Colvin, in answer to my question, "Does the supply keep up?" said, "Yes." He was then asked "Is it as good now as "when you first knew it?" and he again replied, "Yes."—He is certainly wrong, there is no comparison with regard to the supply. I have seen six large vessels loaded there in six days, and now you could not load them in six months.

61,789. I pressed the man upon that very point, and I have read you what his answers were?—His statement is quite untrue.

61,790–3. Here also is the evidence of Michael Doyle:— "Did you hear what the previous witness "stated in regard to the oyster-fishing?—I did. You "heard what he said with regard to there having "been oyster-fishing with a great many boats on the "oyster beds for the last 40 or 50 years?—Yes. And "that the supply of oysters upon those beds is as "good now as ever it was?—Yes. Do you agree "with that?—Yes, I do." You see he confirms the evidence of the previous witness?—It is altogether untrue.

61,794. (*Mr. Lefevre.*) Supposing it to be the fact that the Arklow fisheries have fallen off as you say, may not that be due to the want of spat as has been the case elsewhere?—Yes, to the want of spat occasioned by the slob and by the want of working upon the beds in the summer time.

61,795. On the Essex coast there has not been a good spat for the last five or six years?—No.

61,796. That is not due to the slob?—Yes, it is. It is due to the slob all over the Channel.

61,797. On the Essex ground there has been no restriction as to dredging?—Not so much, but there has been a restriction. There has been a failure in the spat, no doubt, on all the grounds, but in consequence of the spat having failed on the Essex public grounds, it has not been worth while for the men to work, and hence they have gone away to other places. The Essex ground has not been worked as much as usual.

61,798. Then two or three bad seasons are liable to produce other bad seasons in that way?—Yes.

61,799. (*Professor Huxley.*) It is quite clear that the Arklow men were agreed as to there being a good supply of oysters there?—It is quite clear to me that there are no oysters at Arklow. I wrote down there the other day, and I was told that they were very scarce indeed, and that they really did not think it would be possible to get 1,000 tubs in the course of a month.

61,800. (*Mr. Lefevre.*) We were there last year before the open season began?—It has been vastly decreasing and falling off since 1852. They had begun to decrease before that, but they have been going off fast ever since, and the prices have been going up because the stock has decreased. When I first knew the place, a boat could load itself in five hours. I have often seen it. I have gone off there and told them over night that I should want a load by to-morrow. In the morning I have hoisted my flag to tell them I was ready. I have seen the boats then go to work, and in the course of five hours they would be alongside the vessel with enough oysters to load her. Take 1850, that was an average season; the quantity of oysters bought there would be 30,000 or 40,000 tubs. Perhaps Capt. Austin would have got 20,000 tubs, Queenborough would have got 10,000 tubs, and five or six other individuals would take altogether about 5,000 or 6,000 tubs. Then in addition to that the whole of the Arklow merchants as they call themselves were running oysters over to Beaumaris until there was not room to put down a cargo. I myself bought there as many as 10,000 bushels to lay down in the Menai Straits. We had in the Menai Straits I should suppose about 200,000 bushels and as many as 100,030 of them would come from Arklow. Now there has been no catch like that within the last two or three years. Indeed the people have knocked off from going there because they could not get enough to pay them for having their vessels lying about. I believe the Frenchmen got one cargo shipped there of about 250,000 tubs this year, but they have not been able to get any stock at Dublin for their ground, and Liverpool, which always looked for a supply from Arklow, has had none.

61,801. (*Professor Huxley.*) Here is the official report of the Board of Fisheries, after an inquiry at Arklow, which took place in 1863. It is the report of the Inspecting Commissioner and contains the following statement: "The fishery by the Arklow "boats commenced on the 14th January and ended "on the 24th of May, the total catch was 34,038 bar-"rels of which 7,988 were disposed of on the Irish "coast, chiefly Dublin station."—I have taken more than that in one season.

61,802. You call that a small catch?—Yes, that

bears out exactly what I said. In 1850 we had in the Menai Straits 200,000 which had been brought from Arklow besides 30,000 which came round by land.

61,803. The paragraph goes on to say, "2,860 on "the Welsh Coast; 2,600 in France, and the re- "mainder 20,590 at London and Kent. The total "sum realized was 10,829*l.* 16*s.*" that is nothing very extraordinary?—Nothing.

61,804. "About 6*s.* 4*d.* per barrel, the ordinary herring "barrel of 600 to 700, and weighing about $1\frac{3}{4}$ cwt. "full." You consider that that bears out your impression?—Yes; there is no doubt it is a correct statement, but that bears no proportion to what was caught years back. There was a much larger quantity of oysters caught years ago, and yet there are double as many boats at Arklow now as there were in 1847; 1847 was the first year I went to Arklow to buy oysters; it was the year of the famine, and in that year I was able to get oysters at 4*s.* a bushel. They had very few boats there then; I believe there were not more than 25 at work, but as they continued to work they got more, and I believe the boats increased in number that year. I was there for several years afterwards, and each year more oysters were caught; they found out fresh spots and caught more oysters; then bye-and-bye there was a great rush of English and other persons there because there were immense quantities of oysters to be found, and large quantities were caught and taken away; then the fishery began to fall off, and that scarcity has continued from 1851 down to the present time. I have not been buying there since 1852, but if I am rightly informed you will find that the price has gone up until it has trebled, and more than trebled, but the quantity of oysters has greatly decreased.

61,805. Would you consider 6*s.* 4*d.* a barrel an extravagant price?—Yes; I have bought them there at 1*s.* a barrel, and I never gave more than 5*s.*

61,806. And you consider 30,000 barrels a small catch?—Yes, very small.

61,807. (*Mr. Lefevre.*) When did the restriction as to close-time begin to operate there?—If I recollect rightly I believe the Convention was in 1842, but it was not carried out there until 1849. I worked there in 1847, and then we worked at any time, and in 1848 we also worked at any time, but in 1849 we were restricted. They have been exceedingly strict since then, so much so that they would not allow persons at the Pigeon House at Dublin to load their boats with shovels.

61,808. Did you go to Arklow in the famine?—Yes.

61,809. And by your encouragement the people were induced to take to oyster-fishing?—Yes.

61,810. Was that branch of fishing very little practised there before?—Yes; very little.

61,811. Was it mainly in consequence of your encouragement that they took to it?—I think it was. I went to the priest and got him to preach sermons to them.

61,812. Was that Mr. Redmond?—Yes.

61,813. We had his evidence at Arklow?—I got him to induce them to change their dredges from the large dredge to a small dredge, and they have caught a great many more oysters since.

61,814. You attribute the falling off to the enforcement of the close-time?—In all private grounds we never look to the produce from that particular place to stock it; that may be an auxiliary but we require to buy oysters to stock the ground, and if we cannot buy them then the private grounds are influenced in consequence, the ground does not get as much worked as it ought to do, and it gets covered with slob; whereas, if oysters could have been obtained from the outside, the grounds would have been constantly full of oysters and would constantly have been worked. With regard to the leasing of large tracts of ground from the public ground to private individuals I think if that is done some compensation ought to be given to the fishermen who are in the habit of fishing there. For instance, in the case of the Herne Bay ground, if they mean honestly they cannot stock that ground without employing a great amount of labour, and there might be some provision made to provide employment for the fishermen.

61,815. (*Professor Huxley.*) What do you think would be the most practical measure for the encouragement of oyster cultivation round the coast?—Upon every eligible spot of ground I would allow them to form private beds but with this restriction, that it should be worked honestly as an oyster ground.

61,816. (*Mr. Lefevre.*) What would you do with regard to the open ground?—Upon the public ground I would take off every kind of restriction. You may depend upon it that fishermen would never work it to the injury of themselves; I would take off every restriction as to close-time, but I would make one further regulation, that from May until August no oysters should be sold in the market.

61,817. (*Professor Huxley.*) Not in any market at all?—No, not for consumption.

61,818. What does it matter in the long run whether they are sold for consumption or for the private grounds?—If they were sold for consumption a vast number would be wasted, which on the private grounds would come to maturity. Ten out of every 100 spawn every year, and if they are sold they are wasted, but if they are put on the private grounds they are protected.

61,819. Are they laid down in places where they will not breed?—Not once in 100 times.

61,820. Are the grounds they are laid on for the purpose of supplying the market not breeding grounds?—They abut on grounds where they do breed. The spat runs into the sea and although it may not fall in that particular place it will run to the next place; for instance the fall of spat from the Whitstable grounds runs over on to the flats. If they have 40,000 or 50,000 or 100,000 bushels lying on that ground 10 out of every 100 of which are spawning, that spat would be saved, but if they were sent to the market then 10 in 100 would be thrown away; you cannot eat them in a milky state like that.

61,821. No native oysters are sent to the market in the close-time?—No, only common oysters.

61,822. You have had a grant from the Woods and Forests of your ground?—Yes, in the Stour.

61,823. Do you pay rent for it?—Yes, we pay a very large rent indeed for it. Mr. Wills has agreed to pay a rising rent; the first three years so much, the second three years still more, and the third three years more still, until it reaches 1000*l.* a year.

61,824. What is the size of the ground there?—It is not very large; probably about 100 acres. Upon a portion we have got below that, down as far as Harwich, there has been spat, and there would be a good deal if the five-fingers had not cleared it off. On the part we have got from Evertonness up to Strattoness there never were any oysters; they have all been eaten up by the five-fingers, slob and the like, but we got a spat there last summer.

61,825. Where there never was spat before?—Yes, but we have laid a good many oysters upon the ground there; we obtained them from Falmouth and other places.

61,826. Are there a good many spots round the coast which might be used for oyster beds?—Yes; round about Langston and Chichester harbours there are. A good many years ago we tried to get up a company like the Whitstable Company, but Squire Padwick of Hayling Island opposed us; I tried to get a local Act for it, but I could not manage it, or otherwise it would have been a splendid place as a nursery for oysters.

61,827. By dealing with the fishermen in that way and by incorporating them like the Whitstable Company you would remove the difficulty of getting rid of public rights?—That is how it should be done.

61,828. That is the only mode in which the interests of the fishermen could be protected?—Yes; the people all round there work in row-boats both in Langston and Chichester harbours. The boats are small row-

25 March 1865.

boats. They cannot go anywhere else, but I think if these two harbours were formed into a private oyster bed under proper regulations, and the fishermen working upon it were incorporated, there would be double the number of oysters produced there, and I take it that the fisheries form the best nurseries for seamen in the world.

61,829. In consequence of the difficulty experienced in preserving a property in oysters did you go up to the Board of Trade last year?—Yes.

61,830. What measure did you propose to the Board of Trade?—I proposed the measure which I now hand in, and which is as follows:

AN ACT for the better Protection of Property in Oysters.

Whereas localities abound on the shores, estuaries, and beds of tidal rivers throughout the kingdom favourable for the establishment of oyster beds or layings, and the formation of oyster fisheries, affording possible employment to large numbers of boatmen, fishermen, and others, and advantage to the public in the greater abundance and cheapness of oysters, the supply of which has become scarce:

And whereas the establishment of oyster beds or layings, and the maintenance of oyster fisheries involves a large expenditure of capital:

And whereas it appears that such beds or layings as have heretofore been established, or attempted to be established, have been at sundry times broken in upon by fishermen, dredgermen, and others coming in force, continuing to dredge, and renewing their attacks until the whole of the oysters and oyster brood thereon have been taken and carried off from the ground, and the fishery utterly broken up and destroyed:

And whereas it appears that such attacks are made under pretence of disputing the title of the owner or owners of such oysters and oyster brood to the exclusive right of laying oysters and oyster brood upon the grounds of which he or they claim the exclusive right and possession;

Be it therefore enacted by the Queen's most excellent Majesty by and with the advice and consent of the Lords spiritual and temporal, and Commons, in this present Parliament assembled, and by authority of the same, as follows:

1. That where any person or persons shall, as herein-after described, mark out any grounds lying under low-water mark as oyster beds or layings, and shall give such public notice of having done so as is herein-after provided, and shall proceed to deposit oysters, oyster brood, or spat on the space so marked out, the said oysters, oyster brood, and spat, shall be his and their absolute property, and shall belong to him and them exclusively, and any person who shall take or attempt to take, carry away, or destroy them, or any of them, shall be guilty of felony, and shall be punished in the same manner as for simple larceny. And in all cases in which, whether with notice of intent, or otherwise, persons assembling in force and dredging up, carrying off, or otherwise damaging or destroying the oysters, oyster brood, or spat on such beds or layings, or attempting to do the same, such assemblies shall be held to be riotous assemblies, and shall be dispersed as such, and it shall be lawful for the Coastguard, or other duly authorized persons, or officers of justice, to warn such assemblies off such oyster beds or layings, and in case of their refusal to disperse, to capture the vessels or boats of the persons so plundering or damaging the said oyster fishery, or attempting to do the same, and the owner of every such vessel or boat shall be liable to a fine of not less than five, nor exceeding twenty pounds and to confiscation of the vessel or boat, and the dredging gear thereof, or both, or all, at the discretion of the justice or justices of the peace of the district; and the master and crew of every such vessel shall be liable to a fine of not less than one nor exceeding five pounds each person, or to imprisonment for any term not less than 14 days nor exceeding two months.

2. All such beds or layings shall be below low-water mark, and be marked out by posts, with notice boards or buoys defining the limits of the beds or layings, and at least two advertisements shall be inserted in some newspaper circulating in the locality stating that such grounds have been so marked out for oyster beds or layings, and setting forth the nature or ground of the claim or title of the person or persons who has or have so marked out such ground to the exclusive right, whether by grant, lease, immemorial, usage, or otherwise, to lay and dredge oysters, and to cultivate and own the oysters, oyster brood, and spat within such limits so marked out. Provided, nevertheless, that the right to such ground so marked out as aforesaid for the purpose of oyster beds or layings shall in nowise interfere with navigation nor prejudice, prevent, nor lessen the rights of the public of taking or fishing for floating fish in any manner, or at any seasons permitted by law.

3. In case any person or persons dispute the right or claim to such exclusive use by any such alleged owner or owners of such ground so marked out it shall be lawful for such person or persons on giving to such alleged owner or owners three days previous written notice of his or their intention, accompanied by his or their full names and addresses, to remove one of the buoys or posts by which such ground is so marked out, and such removal shall be deemed a trespass on the said beds or layings, and equivalent to a removal of oysters therefrom, and sufficient to raise the question of title, and to compel the alleged owner or owners of the ground so marked out as aforesaid, and of the said oysters, to show and establish, by civil process in one of Her Majesty's superior courts of law, his right to the said exclusive use of grounds so marked out as oyster beds or layings. And in case such process shall not be issued or commenced within three calendar months from the date of the said removal of the said buoy or post as aforesaid the said alleged owner or owners shall lose and forfeit his or their said exclusive right and title to lay oysters, oyster brood, or spat on the said beds or layings so marked out as aforesaid.

4. This Act may be cited as "The Property in Oysters Act."

5. The word oysters shall include oyster brood, spat, or spet and all the other names by which oysters are known during their growth or preparation for market.

The word grounds shall include the sea bottom under low-water mark within shore limits, the bottoms of creeks, bays, harbours, and tidal rivers, and all beds and inclosures thereon for the protection and in increase of oysters.

The word person shall include persons.

The words buoys or boards shall include every description of distinctive mark defining the bounds claimed as oyster beds or layings.

The words floating fish shall include whelks and periwinkles.

61,831. There were also some reasons drawn up in support of the bill?—Yes, as follows:

REASONS in support of the PROPERTY in OYSTERS BILL.

The supply of oysters has within the last few years greatly fallen off, and is now very far below the ordinary demand.

The increased price has not led to an increased production.

It is perfectly easy to increase the supply.

Places suitable for the establishment of oyster beds, and cultivation and increase of oysters, abound along the shores and in the tidal rivers of the kingdom.

Oysters yield an immense natural increase, estimated at from one to two millions of young for each full-grown oyster in a single season.

The establishment of an oyster fishery involves a large expenditure, both in the preparation of the bottom, and in laying down a stock of oysters to grow and spawn upon the ground.

The bottom has to be cleaned from weed, mud, and from star-fish, five-fingers, green crabs, and other creatures that prey upon the young oysters.

In many cases an artificial bottom must be formed to a considerable extent of shells, small stones, &c., that the spat or spawn may adhere to it, and so be saved from being carried out to sea.

The oyster grounds, when stocked with oysters, must be kept clean at a large expenditure in frequent dredgings.

An oyster fishery, in proportion to its extent, will cost from 5,000*l.* to 50,000*l.* to prepare and stock it, and will require at least four years to bring any considerable portion of it into working condition.

Numerous efforts have been made within the last 25 years to establish and maintain private oyster fisheries.

All have been at one time or other attacked in broad day, and plundered by fleets of boats and fishing smacks, varying in number from five or ten to 150 or 200, and which, either in a single day, or by renewed attacks, have entirely swept the ground of all oysters and oyster brood, and totally wasted and destroyed the fishery.

Notable instances of this are the Helford Harbour Fishery, Cornwall, which, in 1838, was plundered to the extent of 50,000*l.* and destroyed. It was the property of the Duke of Leeds, and had been in the undisturbed possession of his family for 200 years. The New Milford Fishery held by Mr. Russell, under a lease from Mr. J. Deverill for upwards of 40 years, and then plundered in a few days of upwards of 20,000*l.* worth of oysters and brood.

The following is a list of further devastations of the like character:—

Names.	Dates.	Owners.
Falmouth Harbour - -	1839	Various.
Jersey Roads, Goree -	1840	Estates of the Island.
Dartmouth Harbour -	1850	Corporation.
Tealm River, Devon -	„	Mr. Kinkham.
Cheiney Rocks, Kent -	„	Mr. Alston.
Thorney Creek, Hants -	1840	Mr. Craswaller.
Sinoh Lake, Hants - -	„	Mr. Padwick.
Mill Rythe, Hants - -	„	„
Bomb Retch Lake, Hants -	„	Mr. Alston.
Spider Lake, Hants -	„	„
Buildings Lake - -	„	Mr. J. Carpenter.
Bosham Holes End, Sussex	„	Mr. Martin.

The law, as it stands, affords no valid protection against this system of destructive plunder.

The men come with public notice in broad daylight in force under pretence of trying the right of the possessor of the fishery to the exclusive use of the portion of sea or river bottom held by him under a presumed title, and for which he pays frequently to an individual or the Crown a high rent.

As the attack is made to try the title, the magistrates will not convict under the 24 & 25 Vict. c. 96, s. 26.

The owner has virtually no remedy. He can recover no sufficient damages from the fishermen, who will make by their plunder from 5*l.* to 12*l.* or 20*l.* per head.

That the object of these inroads is plunder only, and not the establishment of an oyster fishery open to public use is proved by the fact that in no single instance have the persons who have pretended to dispute the right re-established the fishery; they have simply plundered and destroyed it.

It is not desired that any enactment shall be passed that shall enable individuals to appropriate rights of oyster dredging or laying open by ancient usage, or in any other manner common to the public.

What is sought is an enactment that shall protect the property in oysters, but shall leave open to trial by civil process the right to the ground or bottom upon which they are laid.

Were such a law in force oyster grounds would be speedily established on a large scale, to the employment of large numbers of the people and the general benefit of the public.

The witness withdrew, and the inquiry terminated.

INDEX TO THE EVIDENCE

TAKEN BY

THE ROYAL COMMISSIONERS

APPOINTED TO INQUIRE INTO THE CONDITION OF

THE SEA FISHERIES OF THE UNITED KINGDOM.

NOTE.—The names in the Index represent the places at which inquiries were held.

ACTS OF PARLIAMENT (see also "Convention"):—
Polperro, 21,977–80; Mevagissey, 22,075–80, 22,082–6; Falmouth, 23,313–24, 23,867–73; Edinburgh, 26,187–91.

ADVOCATE (LORD):—
Edinburgh, 26,511–4, 26,529, 26,538–40, 26,552; Dunbar, 27,527–46.

BALTIC BLOCKADE:—
Effect of—Stornoway, 32,221–5, 32,364.

BASKET TRADE:—
Sunderland, 3894–5, 3913–4.

BIDEFORD BAY:—
Fisheries at—London, 58,753–59,022.

BOARD OF WORKS, DUBLIN (see "Irish Fisheries").

BOATS:—
Hastings, 16,839; Polperro, 21,284–91, 21,306–10; Mevagissey, 22,219–20; Falmouth, 23,063, 23,075–8; Kirkwall, 31,330–4; Howth, 36,085–8, 36,119, 36,394–7, 36,644–52, 36,692–4, 36,711–3; Dublin, 37,241–4; Arklow, 37,937, 37,957, 38,019–39, 38,362–5; Wexford, 39,062–3, 39,734–7; Dungarvan, 39,911–14, 39,978–81, 40,031–2; Kinsale, 41,191–4, 41,205–8, 41,286; Bantry, 42,423, 42,792; Dingle, 42,949–58, 43,428–33, 43,756, 43,773–4; Westport, 43,827, 43,900–5; Moville, 46,602–4, 46,718–9, 46,727, 47,014, 47,063–4, 47,076, 47,224–32, 47,270–3; Carrickfergus, 47,282–5, 47,991–7, 48,027–9; Skerries, 49,084–100, 49,164–72, 49,690–3; Fleetwood, 54,993, 54,995–6, 55,000; Tenby, 56,576–7; London, 61,169–72.

Canoes:—
Dingle, 43,421–61.

Cobles:—
Cost of—Staithes, 5175.
Increase of—Sunderland, 3935.
Number of—Cullercoats, 56–9; Sunderland, 3876–7; Staithes, 5172–4; Filey, 5678; Wexford, 38,990.
Size of—Sunderland, 2999–3000.

Cod Boats (see also "Line Boats"):—
Cost of—Hull, 7251; Dunbar, 27,487–8; Eyemouth, 28,158–164; Lerwick, 31,840–5.
Number and Description of—Hull, 7216–7; Grimsby, 15,916; Eyemouth, 27,826–9, 28,000, 28,073–4, 28,078–80; Stonehaven, 28,924–8; Kirkwall, 31,210, 31,275, 31,308–10; Lerwick, 31,760–2, 31,934–6; Stornoway, 32,273–4, 32,395–7, 32,833–7; Tarbert, 53,439–40.
Increase of—Lowestoft, 14,186; Grimsby, 15,915; Edinburgh, 26,972; Dunbar, 27,256–7; Eyemouth, 27,815; Broughty Ferry, 28,706, 28,749; Stonehaven, 28,890; Peterhead, 29,163, 29,446, 29,535, 29,559; Lerwick, 31,769.
Decrease of—Hull, 7243–9; Kirkwall, 31,311–4.
Size of—Harwich, 21,084–6; Dunbar, 27,485; Eyemouth, 28,073; Broughty Ferry, 28,706, 28,752; Stonehaven, 28,891; Lerwick, 31,770, 31,845; Stornoway, 32,836.
Depreciation in value of—Hull, 7230–1, 7238, 7240, 7244, 7256.
Profits of—Grimsby, 16,670–1; Harwich, 21,083.
Profitable when worked by owners — Hull, 7301, 7756–7.
Not owned by fishermen—Lerwick, 31,845–50.

BOATS (*continued*):—
Crab Boats (see also "Lobster Boats"):—
Torcross, 18,247; Mevagissey, 22,770.

Cutters:—
Billingsgate, 12,501–2, 12,714–9, 12,923–30; Harwich, 20,600.

Drift-net Boats (see "Herring Boats").

Decrease of—Exeter, 19,585–7.
Size of—Exeter, 19,588.
Cost of—Torcross, 18,143; Mevagissey, 22,025–31.

Shrimp Boats (see also "Trawling for Shrimps"):—
Hull, 7638; Lynn, 14,793, 14,797; Boston, 15,226, 15,631–5; Brighton, 18,026–7; Dumfries, 53,845–9, 54,083–5, 54,276, 54,408–9,; Morecambe, 54,571–80, 54,746–8, 54,750–5, 54,904–6; Liverpool, 55,665–7, 56,191–2; Whitstable, 58,695; Brightlingsea, 59,813–4; London, 61,106–10, 61,117, 61,202, 61,233.
Small fish caught by—Hull, 7639–43, 7921; Brighton, 18,096–9.
Small fish thrown overboard—Hull, 7657–8, 7922–3.

Smacks:—
Brixham, 8348–50; Carlingford, 48,226–35; Tenby, 56,867, 57,141; Brightlingsea, 57,355, 59,202–3, 59,534.

Sprat Boats:—
Hull, 7646–54, 7926; Boston, 15,266–7, 15,399; Hastings, 17,051; Exeter, 19,537; Inver, 46,122–26, 46,147, 46,508–9; Brightlingsea, 59,626; London, 61,270.

Sprit Boats:—
Number of—Dingle, 42,949, 43,125–6, 43,195–6, 43,316–9, 43,763.

Stow Boats:—
Number of—Lynn, 14,674, 14,676, 15,008–9; Brightlingsea, 59,362, 59,616.
Decrease of—Ramsgate, 11,060.
Increase of—Lynn, 14,736, 15,009; Boston, 15,657–8.
Small fish taken by—Ramsgate, 10,873–6, 10,882, 10,900.

Trammel Boats:—
Dungarvan, 39,936, 40,733, 41,064; Kinsale, 41,395–6.

Trawl Boats:—
Number and description of—Cullercoats, 12; Hartlepool, 4789; Flamborough, 6737–43; Hull, 6869, 7232–5; Brixham, 8029, 8073, 8076, 8455, 8540, 8964, 8974–9, 9070, 9356, 9359–62; Ramsgate, 10,086, 10,098, 10,264, 10,268, 10,349, 10,486, 10,507; Yarmouth, 11,087–9, 11,091, 11,884, 12,274, 12,276; Billingsgate, 12,418–22, 12,703–4, 12,809–11, 13,231–3, 13,237; Lowestoft, 13,887; Grimsby, 16,071, 16,073, 16,217; Hastings, 16,846–7, 16,851, 16,964, 17,150, 17,226; Brighton, 17,489; Torcross, 18,297; Plymouth, 18,625, 18,690, 18,693–5, 19,116–7; Exeter, 19,377, 19,409–13, 19,423–5, 19,517; Wyke Regis, 20,024, 20,026, 20,475; Harwich, 20,535–50; Kingstown, 35,402, 35,426, 35,480–2, 35,504–7; Howth, 36,180, 36,256, 36,362–4; Ringsend, 37,371–7; Arklow, 38,323–5; Wexford, 38,458–81, 38,700–3; Dunmore, 39,053–7, 39,406; Dungarvan, 40,734, 41,157; Kenmare, 41,758, 41,889, 41,929–42; Bantry, 42,561, 42,637, 42,640; Dingle, 43,034–39, 43,076, 43,104, 43,698, 43,704, 43,764; Galway, 44,496–7, 44,638–9, 45,192, 45,393, 45,474, 45,906–7, 46,009–25; Moville, 46,634, 46,780–1, 46,864–72; Carrickfergus, 47,556, 47,644–7, 47,679–81, 47,726, 48,027; Carlingford, 48,195; Dundalk, 48,989–90; Skerries, 49,231, 49,316–9, 49,325–8, 49,382–97, 49,627–31, 49,710; Balbriggan, 49,770, 49,825–52; Liverpool, 55,665–7, 55,834–8; Carnarvon, 56,389, 56,426–8; Tenby, 56,583–5, 56,612–20; Swansea, 57,260–71, 57,974–6; London, 58,773–4, 58,920–6, 58,955–7, 60,920, 60,947, 61,077, 61,112.
Increase of—Sunderland, 3283–4; Hartlepool, 4789, 4834–40; Filey, 6051, 6055, 6200, 6206, 6311; Hull, 6868–9, 6928–31, 7128, 7241, 7433, 7469, 7699; Brixham, 8038–9, 8072, 8354, 8375, 8450, 8555–8, 8691, 8770–2, 8903–4, 8976–7, 9363, 9380; Ramsgate, 10,268, 10,502, 10,635, 10,714, 10,726, 10,851; Yarmouth, 11,090–5, 11,367, 11,629–32, 11,745–53; Lowestoft, 14,186–93, 14,230; Boston, 15,218–23; Grimsby, 16,073, 16,077, 16,152, 16,212–3, 16,326, 16,637–40; Hastings, 17,142–8, 17,227–8; Brighton, 17,494, 17,952–3; Torcross, 18,296, 18,299–303, 18,399, 18,406–7, 18,443, 18,506; Plymouth, 18,622, 18,691–2, 19,125–7, 19,129, 19,224; Wyke Regis, 20,312, 20,481–507; Kingstown, 35,426, 35,504, 35,607–8; Ringsend, 37,382–3, 37,518; Wexford, 38,724–6; Dunmore, 39,086–93, 39,323–5, 39,521–3; Dingle, 43,077–8, 43,086, 43,103, 43,345–7, 43,378–80; Galway, 45,473, 45,730, 45,932–9, 46,067–8; Carrickfergus, 47,383–5; Skerries, 49,133–9; Greenock, 49,920–1; Fleetwood, 55,068–71; Liverpool, 55,838, 55,989; Tenby, 56,691, 56,806; London, 58,948, 58,956.
Decrease of — Galway, 45,483–7; Carrickfergus, 47,485–9, 47,557–8; Skerries, 49,653–6, 49,694; Balbriggan, 49,725–7, 49,772–4; Fleetwood, 55,077–80.
Cost of—Sunderland, 3272–3, 3981; Hull, 6915–17; Brixham, 8051–2; Yarmouth, 11,251; Billingsgate, 12,739; Plymouth, 18,699–702; Ringsend, 37,378–81; Dungarvan, 40,058, 40,881–5; Dingle, 43,134–5; Galway, 45,909; Carrickfergus, 47,728; Fleetwood, 55,329–30.
Size of—Sunderland, 3286–93, 3475; Flamborough, 6738; Hull, 6870; Brixham, 8031–4, 8681, 8959–62, 9168, 9364; Ramsgate, 10,493, 10,718; Yarmouth, 11,097, 11,100, 11,619, 11,723, 11,811; Billingsgate, 12,410; Grimsby, 16,139, 16,143, 16,170; Hastings, 17,218; Plymouth, 18,696–8, 18,889, 19,115, 19,224; Exeter, 19,378, 19,414, 19,517–9; Wyke Regis, 20,027; Kingstown, 35,404; Wexford, 38,450–7, 38,691–5; Dunmore, 39,054, 39,070–1; Dungarvan, 40,735–7; Kinsale, 41,272–4, 41,481, 41,566–71; Kenmare, 41,760, 41,887; Bantry, 42,569, 42,638–42, 42,654–57; Dingle, 43,035–36, 43,129, 43,132–33, 43,296–97, 43,784; Galway, 44,640–41, 45,003–4, 45,698, 45,903, 45,941–43, 46,012–13, 46,065–66; Inver, 46,169, 46,173–74; Moville, 46,779, 46,867; Carrickfergus, 47,678; Carlingford, 48,196–98; Dundalk, 48,619–20; Skerries, 49,297, 49,658; Fleetwood, 55,066–7; Liverpool, 55,719–21; Swansea, 57,853–8; London, 58,940–6, 60,929.
Increase in size of—Hull, 6870, 7129–30; Brixham, 8035–6, 8682, 8957, 9134, 9168, 9364; Ramsgate, 10,087, 10,099–100, 10,104–5, 10,241, 10,269, 10,490, 10,535; Yarmouth, 11,097, 11,250, 11,485; Hastings, 17,141, 17,149; Dunmore, 39,070–2, 39,086–93, 39,521–2; Fleetwood, 55,176; Liverpool, 55,660, 55,715, 55,950–1, 55,979.
Increase in value of—Brixham, 8041–3, 8047, 8067; Dungarvan, 40,887–9.
Decrease in value of—Hull, 7232–7; Torcross, 18,506.
Cost of working—Billingsgate, 12,865–6.
Assist vessels in distress—Hull, 7003–6, 7172–3, 7504, 7613–8; Brixham, 8156–8, 8797, 8802; Yarmouth, 11,528; Billingsgate, 12,898–9; Fleetwood, 55,226–31.
Mortgaged — Hull, 7232, 7237; Brixham, 9380–4, 9388.
No inspection of — Billingsgate, 12,909–10, 13,170, 13,205; Fleetwood, 55,369.
Remain at sea in all weathers—Brixham, 8143; Ramsgate, 10,367; Yarmouth, 11,328, 11,526; Billingsgate, 13,280–4; Plymouth, 18,842.
Restriction as to size would be injurious—Plymouth, 18,945–8.
Seizure of—Dingle, 43,233.
Crews of—Galway, 45,905, 46,059–60; Moville, 46,868; Carrickfergus, 47,485–88; Carlingford, 48,197–98; Skerries, 49,296, 49,301–3, 49,326, 49,707–9; Balbriggan, 49,777–83.
Capital invested in—Sunderland, 3981–9; Hull, 6927, 6932–4, 7090–4, 7236, 7475–8; Brixham, 8041–7.
Men per boat—Grimsby, 16,221; Hastings, 16,848, 17,437; Liverpool, 55,720–1.
Improved machinery of—Brixham, 9168–9.

Well Smacks:—
Billingsgate, 12,819–21; Lowestoft, 14,191–3; Fleetwood, 55,301–2.

BOSTON CORPORATION:—
Jurisdiction of—Boston, 15,824, 15,841–93.

BOUNTY ON FISHING:—
Mevagissey, 22,132–3; St. Ives, 24,916–8; Kirkwall, 31,201–4; Dungarvan, 40,023–6; Skerries, 49,333–53, 49,376–80; Balbriggan, 49,729–36.
Objectionable—Dublin, 37,345–6.

Branding of Herrings (see also "Trade Marks"):—
Branding—Edinburgh, 26,180, 26,254–81, 26,917–22, 26,926–30, 26,946; Dunbar, 27,664–6, 27,721–32, 27,754; Eyemouth, 27,767–84. 27,872–77, 27,927–52, 28,016, 28,021–9; Anstruther, 28,580–608, 28,615–22, 28,644; Stonehaven, 29,116–28, 29,136–41; Peterhead, 29,165–86, 29,209–11, 29,245–9, 29,253–68, 29,280–94, 29,301–21, 29,383–401; Wick, 30,419–20, 30,428–42, 30,740–71, 30,802, 30,810–7, 30,842–6, 30,851–3, 30,856, 30,917–20, 30,927–31, 30,948–68, 30,987–9, 30,991, 31,036, 31,080–93, 31,148–64; Kirkwall, 31,347–59, 31,365–8, 31,502–12, 31,733–7; Lerwick, 31,782–5, 31,911–5, 32,102–19, 32,116–39; Howth, 36,762, 36,771.
Unbranded Herrings — Yarmouth, 11,955–6, 11,972, 12,372–3; Anstruther, 28,609–14; Stonehaven, 29,123–8; Peterhead, 29,178–86; Wick, 30,848–50, 31,169–70; Stornoway, 32,309–20, 32,430.
Branding unnecessary — Stornoway, 32,450, 32,637–40, 32,772–6; Greenock, 50,186–90, 50,410–11, 50,869–74, 50,935–44.

Close Time (see "Herrings," "Shell-fish," "Oysters," and "Trawling for Shrimps").

Coastguard:—
Insufficiency of — Carrickfergus, 48,021–25, 48,065; Skerries, 49,609–10, 49,621–24.
Number of—Carrickfergus, 48,015–16, 48,019; Carlingford, 48,191; Skerries, 49,620.
Reports of—Galway, 45,488–90, 45,702–4.
Supervision by—Kenmare, 42,331; Westport, 43,933–39, 44,022–25, 44,122–23, 44,217–30, 44,236, 44,274–312, 44,320–26; Galway, 45,705; Moville, 47,146–57, 47,161, 47,172–84; Carrickfergus, 47,385–93, 47,667, 48,006–14; Carlingford, 48,129–30, 48,184–85, 48,192, 48,210–12, 48,480; Dundalk, 48,584–85; Skerries, 49,604–08, 49,680, 49,698–706; Fleetwood, 55,263–6, 55,369; Tenby, 56,670–81, 56,684–5; Swansea, 57,191–31, 58,008–11.
Stations of—Skerries, 49,613, 49,617–19.
Threats against—Galway, 45,325–27.

Coast Volunteers:—
Ramsgate, 10,395–7; Anstruther, 28,631–4.

Commissions on the Herring Fishery—Edinburgh, 26,173–86, 26,523.

Convention (see also "Legislative Restrictions" and "Regulations"):—
Articles of, enforced—Torquay, 9446–57, 9488; Polperro, 21,807–17; Shoreham, 25,172–6, 25,226; Edinburgh, 26,295–300, 26,458, 26,461–74, 26,477, 26,480–2.
Articles of, not enforced—Staithes, 5419–21; Filey, 5777–9; Hull, 7021, 7036, 7371, 7826–8; Brixham, 9414–21; Torquay, 9484, 9586–9, 9607–8, 9611–5; Ramsgate, 10,218–38, 10,446–8, 10,472, 10,476, 10,952–3; Yarmouth, 11,214; Brighton, 17,791–2; Plymouth, 18,724, 19,214; Polperro, 21,479–83, 21,562–7, 21,589–91; Falmouth, 23,340–5; Shoreham, 25,710; Edinburgh, 26,475; Eyemouth, 27,832–9; Wick, 30,282, 30,285, 30,289–92, 30,325–37; London, 60,874, 60,890–4, 60,904.
Ignorance of — Sunderland, 2935–7, 3322–4, 3365, 3530–1; Hartlepool, 4244, 4427–32; Staithes, 5224–40, 5500; Filey, 5776, 6125, 6251–3, 6285–86; Flamborough, 6545; Hull, 7530–1; Ramsgate, 10,944; Stonehaven, 29,001–2.
Report of Board of Trade in reference to—Torquay, 9489–97.

Numbering—Sunderland, 2968–72, 3351–5, 3967*a*–71; Ramsgate, 10,606, 10,613–8, 10,814–5, 10,818–23, 10,825–9, 10,933–4, 10,963–6; Torcross, 18,284; Plymouth, 18,737–8; Wick, 30,251, 30,257–60, 30,262, 30,315–8, 30,320–3; Ringsend, 37,737–40.
Penalties—Sunderland, 3197–202.
Vanes — Holy Island, 2712–5; Sunderland, 2960–3, 3299–304; Hartlepool, 4411–20; Staithes, 5228–32; Hull, 7111–2, 7413–6; Brixham, 8344–7, 8666–8; Torquay, 9610–3; Ramsgate, 10,467–72; Polperro, 21,570; Edinburgh, 27,123–8; Dunbar, 27,506–9, 27,692; Eyemouth, 27,842; Stonehaven, 28,957–8; Peterhead, 29,694–8; Wick, 30,289–92; London, 60,904–5.

Coopers:—
Edinburgh, 26,383, 26,390–400.

Corallines:—
Fleetwood, 55,165–6.

Cornwall (Duchy of):—
Mevagissey, 23,035.

Curing and Packing of Fish:—
Filey, 6234–5; Yarmouth, 11,957–62, 11,973, 11,979–80, 12,190–204, 12,350–3, 12,358–60, 12,367–71; Lowestoft, 13,847; Edinburgh, 26,923–25, 26,932–45; Dunbar, 27,667–77, 27,707, 27,710–20; Eyemouth, 27,777–80, 27,880; Anstruther, 28,529–32, 28,552–4, 28,641–6; Stonehaven, 29,129–34; Peterhead, 29,176, 29,187–92, 29,271–321; Cromarty, 30,147–9; Wick, 30,242; Kirkwall, 31,472, 31,495–6; Lerwick, 31,924–6; Stornoway, 32,453; Broadford, 33,353–6; Dublin, 37,092–101; Ringsend, 37,887–918; Wicklow, 38,202–4; Westport, 43,906–10, 43,993–4; Inver, 46,271; Greenock, 50,375–8.
Inspection of cured fish—Wick, 30,414–8, 30,421–7.
Proportion of cured fish to fresh—Dunbar, 27,306–8, 27,701–4; Eyemouth, 28,017; Stonehaven, 29,100–3.
Opinion of curers—Greenock, 49,971–3, 50,101–2; Ardrishaig, 51,860.

Drift Nets (see "Herring Nets").

Dues:—
Harbour dues on trawlers abroad—Ramsgate, 10,574.
Harbour licence dues—Dunbar, 27,467–74; Anstruther, 28,658–75, 28,688–90.
Effect of dock charges on price of fish—Hull, 6942–3.
Foreign duties—Ramsgate, 10,560–1, 10,568–72; Hastings, 16,953–5, 16,958–62, 17,485; Edinburgh, 26,324–35; Wick, 30,370–2, 30,821–6.
Import duties injurious—Lerwick, 32,094–100, 32,141–8.

Fish:—
Supply of—Kenmare, 41,721; Westport, 43,868–9; Galway, 45,268, 45,587–90, 45,608–16, 45,827–8; Carrickfergus, 47,874–7; Dundalk, 48,853–5; Skerries, 49,438; Balbriggan, 49,800–3; Greenock, 50,391,

FISH (*continued*) :—
50,393, 50,396; Ballantrae, 53,820*a*; Liverpool, 55,625–56, 55,920–1, 56,304, 56,316–9; Tenby, 56,491–2, 56,500, 56,714–6, 56,814, 56,865.
Increase in supply of—Cullercoats, 75–6; Sunderland, 3231, 3275–6, 3278, 3446–52, 3470, 3771–8, 3904; Hartlepool, 4538–42, 4763–6, 4841–7, 4914–5; Staithes, 5587; Hull, 6935–6, 7337–46, 7433, 7437–8, 7450, 7482, 7548–52, 7628, 7668–76, 7795–803, 7808, 7834–7, 7954, 8003; Brixham, 9134–9, 9149, 9167; Torquay, 9620; Ramsgate, 10,111–17, 10,274–80, 10,287–96, 10,345, 10,500, 10,504, 10,532, 10,632–40, 10,730, 10,787, 10,848–53; Billingsgate, 12,481–2, 12,537, 12,568–71, 12,602–4, 12,611, 12,668–71, 12,830–1, 13,016–8, 13,135, 13,174, 13,245, 13,295, 13,489–91; Lowestoft, 13,886–94; Grimsby, 15,941–3, 16,598; Plymouth, 18,786–98, 19,011, 19,135–7, 19,233, 19,284–8; Edinburgh, 26,301–10, 26,311, 26,879, 27,163–67; Stonehaven, 28,894–7; Lerwick, 31,401; Inver, 46,352–4; Carrickfergus, 47,280; Dundalk, 49,023; Greenock, 50,025–6; Fleetwood, 54,992, 55,051, 55,178, 55,470; Liverpool, 55,656; London, 58,842–3, 60,772–5, 60,926, 60,993, 61,025.
Decrease in supply of — Cullercoats, 40, 86–96, 99–107, 118–20, 237–40, 535–8, 818–24, 881–8, 1025–50; Newbiggin, 1118–27, 1316–30, 1390–5, 1550–5, 1560–78, 1679–80; North Sunderland, 1704, 1714, 1989–92, 2082; Holy Island, 2424–7, 2566–7; Sunderland, 2740–1, 2911–4, 3049–53, 3124–9, 3864–8, 3925–6, 3934–6, 4042; Hartlepool, 4065–7, 4318–29, 4457–61; Staithes, 5029–30, 5037–47, 5055, 5059–60, 5279, 5440, 5512–3, 5590, 5624, 5655; Filey, 5683–6, 5881–3, 6008, 6037–8, 6144, 6193, 6205, 6237; Flamborough, 6428–32, 6588–9, 6645, 6818; Hull, 7267; Brixham, 8087, 8169, 8377–80, 8441, 8693–6, 8703, 8835–6, 8868, 8872–3, 8986, 8990–3, 8997, 9005; Torquay, 9687–8, 9953, 9994; Torcross, 18,148–9, 18,192–202, 18,390–1, 18,417, 18,575–84, 18,601; Plymouth, 18,611, 18,645–52, 18,667, 19,060, 19,095; Exeter, 19,429–30, 19,508, 19,591–4, 19,718–9, 19,768–70, 19,957; Mevagissey, 23,011; Penzance, 24,327–8, 24,495; Edinburgh, 26,958–92, 27,169; Dunbar, 27,251–3, 27,261, 27,437, 27,441; Anstruther, 28,251, 28,394–400; Broughty Ferry, 28,754–8, 28,787; Ringsend, 37,456–8, 37,703–8; Arklow, 38,097; Wexford, 38,470–6, 38,718, 38,834–6, 38,839, 39,002–3; Dunmore, 39,094–106, 39,117–22, 39,136, 39,504–14, 39,637–9, 39,674, 39,682, 39,719–23, 39,743–55, 39,826; Dungarvan, 40,029–30, 40,037, 40,046–9, 40,071–80, 40,182, 40,284–304, 40,480–93, 40,592, 40,665–8; Kinsale, 41,579–82; Kenmare, 42,054, 42,066–68, 42,103, 42,164, 42,170–71; Bantry, 42,441–43, 42,446, 42,464, 42,571, 42,617, 42,652; Dingle, 43,307, 43,483, 43,554, 43,586–90, 43,609–11; Westport, 43,949, 43,951–52, 43,970; Galway, 44,973–74, 45,162–63, 45,412–13, 45,480–82, 45,513–14, 45,617–18, 45,870; Moville, 46,612–14, 46,619–21, 46,632–33, 46,680–81, 46,956–58, 47,019, 47,204–05, 47,258–63, 47,267–68; Carrickfergus, 47,286, 47,474, 47,751–2, 47,760, 47,837–41, 47,878–80, 47,890, 47,925–29, 47,957; Carlingford, 48,159–61; Dundalk, 48,522–23, 48,535, 48,540–3; Skerries, 49,436, 49,550; Greenock, 49,887–8, 49,954–60, 50,094, 50,475–7; Inverary, 52,272–8; Dumfries, 53,822–47, 54,140–51; Liverpool, 55,583–6, 55,724, 55,751, 55,777, 55,988, 55,996–8, 56,054, 56,271–87; Tenby, 57,117–23; Swansea, 57,235–56.
Fluctuations in supply of—Edinburgh, 21,333; Peterhead, 29,158–62, 29,216, 29,329; Wick, 30,690; Galway, 44,911–5; Moville, 47,064–7.
Decrease of, co-incident with trawling—Filey, 5706–12, 5722–31, 5738–47, 5893–9, 5959–63, 6009–10, 6145–53, 6327; Flamborough, 6443, 6590, 6646–51, 6654–7, 6819–23, 6826; Brixham, 8386, 8697–700; Torcross, 18,199, 18,421; Liverpool, 55,996–9.
Cause of decrease—Exeter, 19,496–7, 19,598–9, 19,663–7, 19,671–81, 19,788, 19,896, 19,917–8, 19,932, 19,947; Penzance, 24,328; Wick, 31,122; Kenmare, 42,167; Dingle, 43,484–503, 43,555–56, 43,618–19; Westport, 43,950, 43,956; Moville, 46,622, 47,020, 47,207–10; Skerries, 49,432; Dumfries, 53,844–7; Liverpool, 55,587, 55,675–6, 55,792.
Destroyed by suckers and other fish—Cullercoats, 366, 671–2, 1046; Newbiggin, 1253, 1381–7; Holy Island, 2533–44; Sunderland, 2916–20; Wick, 31,124–5.
Destroyed by moss—Edinburgh, 27,170–200.
Destroyed by coal tar—Swansea, 57,541–4.
Destroyed by manufactories—Swansea, 57,389, 57,541–4.
Supply of not decreasing—Hull, 7404–5; Plymouth, 18,817, 18,916, 19,059, 19,061–2, 19,068, 19,090–1, 19,095; Peterhead, 29,217; Wick, 30,895–7;

FISH (*continued*) :—
Kingstown, 35,592, 35,956, 35,969; Dunmore, 39,266–75, 39,680, 39,834–7; Dungarvan, 41,065, 41,069; Westport, 43,858–9, 43,864–7, 43,871–2; Skerries, 49,355–6; Fleetwood, 55,111, 55,124–5 Liverpool, 56,133, 56,136–41; Carnarvon, 56,429.
Demand beyond supply—Billingsgate, 13,131.
Demand met by supply—Billingsgate, 12,858, 13,156–8.
Foreign supply—Billingsgate, 12,451–4, 12,560–3.
Demand for small fish—Liverpool, 56,125–7.
Injured by use of small mesh—Liverpool, 55,931–3, 55,968–71.
Small, destruction of—Brixham, 8095–9, 8254–5, 8281–2, 8403, 8717, 8730–4, 8842, 8925–6; Lynn, 14,540; Hastings, 17,017–23, 17,384–93; Brighton, 17,513–4, 17,519, 17,529–30, 17,929, 17,931, 18,101; Torcross, 18,171, 18,177–8, 18,186, 18,457–8; Exeter, 19,379, 19,388–400, 19,457, 19,462–3, 19,470, 19,528–9, 19,545, 19,556–60, 19,788, 19,812–8, 19,838, 19,842–3, 19,850, 19,933, 19,964, 19,967; Harwich, 20,537–42, 20,551, 20,988, 21,003; Dungarvan, 40,244, 40,668; Liverpool, 55,931–3, 56,158–72.
Small, not taken in deep water — Brixham, 8103–6, 8396, 8719, 8732, 8843.
Small, sold for manure—Staithes, 5611; Hull, 7369; Brixham, 8388–92; Ramsgate, 10,874, 10,886–9; Lynn, 14,473, 14,690, 14,692; Mevagissey, 22,630–2, 22,964–5; Penzance, 24,305–7; Galway, 45,762–7.
Small, sold for bait—Harwich, 20,541, 20,554–61.
Proportion of large and small — Grimsby, 16,570–3, 16,576, 16,579–82; Brighton, 17,531–41, 17,691–2, 17,860, 17,916–8, 18,123.
Proportion of trawl and line for London market—Billingsgate, 12,862, 12,867–9, 13,499.
Condemned—Sunderland, 3329–34; Hartlepool, 4917, 4974–81; Hull, 7186, 7419, 7422–3, 7910–7; Carrickfergus, 48,069–73.
Quality, no falling off in—Hull, 7055, 7085, 7147, 7347–8, 7444, 7815, 8004; Plymouth, 18,638.
Quality, falling off in—Exeter, 19,432–4.
Comparative condition of trawled and line fish—Cullercoats, 240–7, 303, 488–9, 746–7, 839–43; Sunderland, 3255–6, 3259–61, 3335–9, 3549–66, 3593–631, 3794–8, 3811–8, 3927–8; Hartlepool, 4490–1, 4572–91, 4940–3, 4982, 4987–92, 4993–5000; Filey, 5676, 5909–21, 5973–6; Brixham, 8121, 8574–9, 9144–5; Billingsgate, 12,496, 12,822, 13,305–9; Lowestoft, 14,213–8; Grimsby, 15,934–6; Plymouth, 18,766–71, 18,776, 18,785, 19,139–47; Dunbar, 27,403–4; Eyemouth, 27,963–6.
Sent to market by railway — Cullercoats, 717–9; North Sunderland, 2360–3; Sunderland, 3992–4; Lowestoft, 14,389–401; Torcross, 18,330–3, 18,377; Edinburgh, 26,313; Peterhead, 29,152; Morecambe, 54,987; Tenby, 56,579–81.
Sent inland—Billingsgate, 12,567, 12,572–4, 12,583–7, 13,115–20; Brighton, 17,515, 17,958–61; Tenby, 56,572–5.
Advantage of selling fish in French ports — London, 60,940–4, 60,999–61,001, 61,036–7.
Offal fish—Hull, 7462, 7867–9; Yarmouth, 11,522–4, 11,851–3; Billingsgate, 12,548–58; Grimsby, 16,084, 16,095, 16,103.
Salted—Staithes, 5621–4; Kinsale, 41,279–80; Kenmare, 41,837.
Bait for—Cullercoats, 44–7; North Sunderland, 1746; Holy Island, 2556; Sunderland, 2755; Staithes, 5091–104; Filey, 5886–9, 6127–9; Flamborough, 6559–68, 6754; Hull, 7740, 7746–8; Billingsgate, 12,946–50, 13,451–2; Grimsby, 16,036–7; Plymouth, 19,018–9; Harwich, 20,541, 20,554–61, 20,618–20; Edinburgh, 26,671, 26,768, 26,848–51, 27,048–51; Dunbar, 27,396–402, 27,432–5; Eyemouth, 27,824–5, 28,099, 28,105, 28,107–20, 28,181–8; Anstruther, 28,341–7, 28,416–9; Broughty Ferry, 28,736, 28,788–90; Stonehaven, 28,987–93; Peterhead, 29,357, 29,472, 29,476–9, 29,563–7, 29,587–90, 29,642–6, 29,713–5, 29,731–50; Cromarty, 29,820–37, 29,976–81, 30,007–8; Wick, 30,177, 30,213, 30,225, 30,483, 30,609–10; Kirkwall, 31,197, 31,246, 31,300–1; Lerwick, 31,772–6, 31,795–7, 32,032–5, 32,054–5; Stornoway, 32,375–7, 32,564–5, 32,571–5, 32,742, 32,793–4, 32,862; Broadford, 33,383; Tobermory, 33,569; Campbeltown, 33,663–7, 33,753–4, 34,048, 34,096, 34,138, 34,173; Peel, 34,615; Kingstown, 35,721–6, 35,781–3; Howth, 36,024, 36,071; Dublin, 37,229–31; Ringsend, 37,921; Dungarvan, 40,001–5, 40,192–6, 40,257–60, 40,442–52; Kinsale, 41,473, 41,505–7, 41,667–71, 41,712–13; Westport, 43,973–4; Moville, 46,728–9, 47,214–8; Carrickfergus, 47,368–71, 47,772–5, 47,888; Carlingford, 48,205–7; Dundalk, 48,603–5, 48,770–73, 48,819–

FISH (*continued*):—

22; Skerries, 49,418–22, 49,429–31, 49,462–67, 49,484–88, 49,499–501, 49,514, 49,552–3, 49,570–1; Balbriggan, 49,854–5; Greenock, 50,109–25, 50,247–56, 50,518, 50,699–701, 50,754–64; Ardrishaig, 51,828, 51,846–7, 52,103–8, 52,133, 52,234–40, 52,247–9; Tarbert, 53,407–12, 53,414–19; Ballantrae, 53,820*a*; Dumfries, 53,904; Morecambe, 54,807–11; Tenby, 56,993–7, 57,124–7; Swansea, 57,785; London, 61,689.

Price of—Cullercoats, 304; Sunderland, 3906–9, 4025–6; Hartlepool, 4468–76, 4592, 4843, 4907–13, 4950, 4982; Billingsgate, 12,457–8, 12,464–7, 12,558, 12,663–6, 12,835, 12,870–2, 13,020, 13,177–85, 13,493; Yarmouth, 11,316–20, 11,322–3, 11,688–9; Grimsby, 16,056–9, 16,062, 16,078–82, 16,088–92, 16,654–8; Hastings, 16,894, 17,038–40, 17,255; Torcross, 18,523–7; Plymouth, 18,885–7, 19,153–6, 19,166–7; Stonehaven, 29,114–5; Ringsend, 37,617–23, 37,625–30; Dungarvan, 41,012–14; Kinsale, 41,583–4, 41,673–5; Dingle, 43,539–45; Galway, 45,129–31, 45,989–96; Inver, 46,273; Moville, 46,675–79*a*, 46,963–64, 47,001–5; Carrickfergus, 47,372–74; Dundalk, 48,859–66; Greenock, 49,924; Ardrishaig, 51,214–5, 51,342–55, 51,401–8; Liverpool, 55,686–91, 55,991–2.

Eels (*Conger*):—
Billingsgate, 13,067–77; Lynn, 14,783–8; Plymouth, 18,996–7; Polperro, 21,353–4; Peel, 34,787–93; Kingstown, 35,713–5; Ringsend, 37,602; Dunmore, 39,438; Kinsale, 41,461–6; Skerries, 49,474, 49,551; Ardrishaig, 51,828–9.

Eels (*Lampern*):—
Filey, 6129.

Eels (*Lampreys*):—
Exeter, 19,376.

Eels (*Sand*):—
Moville, 47,036, 47,039–41.

Five-Fingers (see also "Star Fish"):—
Destroy mussels—Billingsgate, 13,443; Westport, 44,096–8.

Flat Fish:—
Harwich, 21,243–52; Campbeltown, 33,699–701; Dingle, 43,304–05; Carrickfergus, 47,475–76, 47,730; Carlingford, 48,098–100; Dundalk, 48,649–54, 48,741, 48,997–98; Balbriggan, 49,745; Dumfries, 53,845–66, 53,870–6; Morecambe, 54,884.

Flounders (see also "Trawling for Flounders"):—
Exeter, 19,783–6, 19,810, 19,819–20, 19,828–31, 19,841, 19,888–91, 19,904, 19,907, 19,930–2, 19,943; Wyke Regis, 20,449; Broughty Ferry, 28,698; Moville, 46,884, 47,056–60; Greenock, 49,910; Inverary, 52,274; Dumfries, 53,822–30, 53,837–9, 53,845–66, 53,877–83, 53,907–9, 53,940–3, 53,946–57, 54,055–9, 54,082, 54,170, 54,182–3, 54,339–52, 54,391–7; Morecambe, 54,623–8, 54,741–5, 54,756–9; Fleetwood, 55,436–7; Carnarvon, 56,458–9; Tenby, 56,527–31, 56,723–4; Swansea, 57,541.

Flukes (see also "Trawling for Flukes"):—
Moville, 46,610; Morecambe, 54,615*a*–17; Fleetwood, 55,037, 55,479.

Gurnard:—
Brixham, 8478, 8570; Dungarvan, 41,067–8; Fleetwood, 55,096–7, 55,476, 55,479; Tenby, 56,501–10, 56,722.

Haddock:—
Number of—Filey, 5683, 5692; Hull, 6893, 7068, 7764; Yarmouth, 11,235; Dunbar, 27,587–9; Eyemouth, 28,009, 28,125; Stonehaven, 28,906, 28,998, 29,038–42, 29,050–3; Arklow, 38,094–5; Ballantrae, 53,820*a*; Tenby, 56,523–6.
Increase of—Hull, 6947, 7056, 7168–71, 7350, 7487, 7495, 7567, 7742; Yarmouth, 11,232, 11,455; Billingsgate, 12,433–5, 12,495, 12,537–43; Edinburgh, 26,966–72; Dunbar, 27,455–7; Eyemouth, 27,816, 27,890–2, 28,031; Anstruther, 28,261–6; Stonehaven, 28,895–7; Peterhead, 29,627–8; Campbeltown, 33,869; Dundalk, 48,792, 48,967, 48,970, 49,011; London, 61,031.
Decrease of—Cullercoats, 240, 751–2, 824–7; Newbiggin, 1128–300, 1680; North Sunderland, 1715–22, 2308–18; Holy Island, 2427, 2567; Sunderland, 2744–7, 3841; Hartlepool, 4119, 4320–2; Staithes, 5060, 5283; Filey, 5882, 6196; Flamborough, 6435–6, 6591; Brixham, 8472, 9007, 9043–8; Ramsgate, 10,097, 10,189–94, 10,401–2, 10,688; Brighton, 17,671; Falmouth, 23,820–1; Edinburgh, 27,061; Dunbar, 27,251, 27,578; Broughty Ferry, 28,698*b*–9; Peterhead, 29,340–2, 29,446, 29,511–3, 29,714–19; Cromarty, 29,861–2, 29,959–63; Wick, 30,352, 30,463–5, 30,576–82, 30,873; Kirkwall, 31,179–82, 31,563, 31,654; Stornoway, 32,282–5, 32,576–8; Campbeltown, 33,691–2, 34,147–8; Peel, 34,392; Ringsend, 37,405, 37,449–52, 37,518–9, 37,579–81, 37,784–9, 37,866–78; Wexford, 38,499–503, 38,990; Dunmore, 39,361–7; Kinsale, 41,327–33, 41,339–46, 41,420–4, 41,547–8, 41,563–5; Dingle, 43,285–6; Westport, 43,971, 44,429–31; Galway, 44,776–8, 45,800; Inver, 46,355–8, 46,543–5; Carrickfergus, 47,328, 47,580–1; Dundalk, 48,630–3, 48,681, 48,734, 48,788; Skerries, 49,101, 49,268–76, 49,439–41, 49,443–6, 49,680–4; Balbriggan, 49,742–3; Greenock, 49,889–92, 50,676, 50,697–8; Ardrishaig, 51,833–5; Tarbert, 53,400–5; Dumfries, 53,833–6; Tenby, 56,588–92.
Disappeared altogether—Portree, 32,998, 33,001; Peel, 34,586–9; Kingstown, 35,433–4, 35,465–8, 35,508–9, 35,526, 35,542, 35,657–8, 35,795; Howth, 35,985–8, 36,014–5, 36,022–7, 36,392–3; Dungarvan, 40,434–7, 40,575–9, 40,656–62, 41,070; Inver, 46,189–91, 46,258–9; Moville, 47,246; Dumfries, 53,834–6; Fleetwood, 55,117–8, 55,202–7; Liverpool, 55,585, 55,624, 55,778, 56,135, 56,285.
Quantities taken formerly—Westport, 43,839–41; Galway, 45,165; Moville, 47,248–9; Carrickfergus, 47,582–3; Dundalk, 48,636–7, 48,733, 48,965; Skerries, 49,271, 49,533–6; Balbriggan, 49,816–19.
Size of—Newbiggin, 1129–30; Sunderland, 3054; Hull, 7052–4; Yarmouth, 11,229–30, 11,373, 11,454; Grimsby, 16,455–7.
Decrease in size of—Cullercoats, 111–3, 240, 751–2, 824–7, 891, 1037–8; Newbiggin, 1681–3; North Sunderland, 1926, 1994, 2316; Holy Island, 2428–9, 2569–74; Sunderland, 2742–3; Hartlepool, 4070–4, 4323, 4462–6; Staithes, 5059, 5283, 5514, 5518–9, 5560, 5592; Grimsby, 15,905.
Variation in size of—Eyemouth, 28,055–7; Peterhead, 29,577.
Fishing capable of extension—Kirkwall, 31,408–9.
Season for—Grimsby, 16,369; Cromarty, 29,773; London, 58,784–1.
Quality of—Peterhead, 29,618, 29,621–2; London, 60,850–2, 60,857–62.
Smoked—Billingsgate, 13,080–3; Grimsby, 16,058, 16,091.
Markets for—Eyemouth, 28,036; Stonehaven, 29,067–9.
Price of—London, 60,853.
Mode of curing—Eyemouth, 27,977–86; Stonehaven, 29,054–59, 29,070–1; Cromarty, 29,803–5.

Hake:—
Brixham, 8084, 8473, 9048, 9262, 9266; Falmouth, 23,820; St. Ives, 24,856–60; Ringsend, 37,468–9, 37,602; Wexford, 38,505–7; Dunmore, 39,421–33, 39,438; Dungarvan, 40,711–5, 40,731, 40,800–10, 40,922–7, 41,163–5; Kinsale, 41,195, 41,231–3, 41,386–7, 41,405–8; Bantry, 42,537–8, 42,709; Dingle, 43,673–9; Inver, 46,206; Greenock, 50,049; Tarbert, 53,406.
Decrease of—Polperro, 21,710–6; Dunmore, 39,443, 39,601–5, 39,609; Dungarvan, 40,467–75; Kinsale, 41,209–10, 41,261–2, 41,315–22, 41,398–400, 41,425, 41,578; Bantry, 42,527–8, 42,613–4, 43,650–2; Inver, 46,197.
Increase of—Dingle, 43,509, 43,735–8.

Halibut:—
North Sunderland, 1994; Staithes, 5062–3; Filey, 5692; Hull, 6893; Anstruther, 28,431–2; Inverary, 52,274.
Decrease of—Staithes, 5063, 5531–3; Filey, 5698, 6196.
Kept alive in open boxes—Grimsby, 16,000.

Herrings (see also "Trawling for Herrings"):—
Take of—Yarmouth, 11,951, 12,049, 12,123–7, 12,265–73; Lowestoft, 14,318–22; Wick, 31,106–9; Stornoway, 32,212–4, 32,501, 32,688, 32,755, 32,944; Kingstown, 35,449; Galway, 45,022–5, 45,685; Ardrishaig, 50,961–2, 51,486, 52,033–6; Inverary, 52,317; Ballantrae, 53,820*a*; Morecambe, 54,682; Fleetwood, 55,495–9; Tenby, 56,914; London, 60,812–4, 60,823–5.
Large quantities caught formerly—Kenmare, 41,784–5, 42,112; Bantry, 42,603, 42,649, 42,798, 42,808–9, 42,817, 42,895–6; Westport, 44,417; Galway, 45,132–3; Inver, 46,375–8; Moville, 46,642, 47,082–5; Carrickfergus, 47,338, 47,780–1, 47,823, 47,893.

Fish (*continued*):—

Herrings (continued):—

Large quantities could be caught—Bantry, 42,624; Westport, 44,463–5; Moville, 46,646–7, 46,816.

Increase of—Staithes, 5539–40, 5542, 5600, 5624; Flamborough, 6596–7; Ramsgate, 11,007–8; Yarmouth, 11,914, 12,010, 12,133–5, 12,383; Billingsgate, 13,023–37; Lowestoft, 13,697, 13,784, 14,211–2; King's Lynn, 14,447, 14,719–20; Boston, 15,695; Exeter, 19,727–8; Dunbar, 27,630–1; Peterhead, 29,157–8, 29,375–6; Kirkwall, 31,553; Tobermory, 33,582; Campbeltown, 33,653, 33,737, 33,813, 34,144; Peel, 34,531; Howth, 36,047–52; Dingle, 43,122–3, 43,510, 43,746; Westport, 43,942; Galway, 44,690–2; Inver, 46,132, 46,199, 46,391; Carlingford, 48,452–5; Dundalk, 49,009–13, 49,034, 49,037–8, 49,042–7; Skerries, 49,106–9, 49,259–61; London, 58,994, 60,809–12.

Habits of—Tarbert, 53,204–15.

Decrease of—Cullercoats, 200–8, 222–5, 467–9, 480–1, 564–6, 655–6, 695–705, 1042–3; Newbiggin, 1132–9, 1334–40, 1607–14; North Sunderland, 1788, 1947–54, 1996, 2082, 2237–9, 2390–1; Holy Island, 2447–50, 2577–9, 2667–9; Sunderland, 2833–54, 3075–6, 3140; Hartlepool, 4188–92, 4204–11, 4361; Staithes, 5114–7, 5333–5, 5451, 5456–9; Filey, 5754–5, 5764, 5931–4, 6030–1, 6039–42, 6164; Flamborough, 6712–6, 6841–2; Brixham, 9048–9, 9094, 9121–2; King's Lynn, 14,585, 14,588–9, 14,732, 14,735–6, 14,801–3, 14,923–30; Boston, 15,269, 15,271–2, 15,355, 15,388, 15,393, 15,397, 15,437, 15,444, 15,453, 15,592, 15,595, 15,682, 15,780; Hastings, 16,835, 16,837, 16,918–9, 17,332–4, 17,344, 17,350–5, 17,374; Brighton, 17,574–5, 17,720, 18,033; Wyke Regis, 20,250; St. Ives, 24,874–5; Edinburgh, 26,950, 26,952; Dunbar, 27,291–4, 27,354; Eyemouth, 27,795–8; Anstruther, 28,252, 28,304, 28,438, 28,484; Peterhead, 29,534, 29,558; Cromarty, 29,846–65, 29,943–9, 30,140–1; Wick, 30,246–7, 30,351, 31,106–9, 31,117, 31,127–31; Lerwick, 31,909, 32,060–1, 32,151; Broadford, 33,195, 33,239–45; Tobermory, 33,431–3; Peel, 35,027; Kinsale, 41,347–50; Kenmare, 42,054, 42,172–3; Bantry, 42,454–6, 42,602, 42,730, 42,752, 42,797, 42,831–2; Dingle, 43,636–42, 43,743; Westport, 43,977, 43,995–9, 44,001–3, 44,410, 44,435–8; Galway, 44,534, 45,377, 45,748; Inver, 46,193–4, 46,537; Moville, 46,641, 47,035; Carrickfergus, 47,335–7, 47,447, 47,777, 47,781, 47,892, 47,909; Dundalk, 48,553, 48,661–2; Greenock, 50,317–8; Inverary, 52,797–803; Tarbert, 53,587; Swansea, 57,323, 57,411–5, 57,417.

Fluctuation in quantity—North Sunderland, 2182; Lynn, 14,485; Edinburgh, 27,056–7; Eyemouth, 28,088; Broughty Ferry, 28,704; Stonehaven, 28,841, 29,106; Peterhead, 29,157, 29,277, 29,330, 29,404; Wick, 30,357–8, 31,096–7; Kirkwall, 31,443–5, 31,501, 31,726–8; Ardrishaig, 51,479–85; Dumfries, 54,032–40, 54,143–51; Morecambe, 54,674–81, 54,948–9; Fleetwood, 55,001–5, 55,559–64; Tenby, 56,494–5; London, 58,968–70, 58,972–3, 58,999.

Condition of—Torquay, 9781–93; Ramsgate, 10,663–6; Lowestoft, 13,849, 14,172–6; Lynn, 14,750–2; Boston, 15,738–41; Hastings, 16,922; Plymouth, 18,983–6; Dunbar, 27,352; Stonehaven, 28,976–7; Peterhead, 29,372–4, 29,500; Wick, 30,201, 30,227–30, 31,056; Kirkwall, 31,668–75; Arklow, 38,054–6, 38,071–8, 38,080, 38,186–99; Wexford, 38,649–53; Kinsale, 41,255–7, 41,353–5, 41,365, 41,367–73; Bantry, 42,810, 42,813, 42,819, 42,826; Dingle, 43,145–6, 43,149, 43,153; Inver, 46,298, 46,402; Moville, 46,693–6; Carrickfergus, 47,910–11; Carlingford, 48,382–3, 48,394; Dundalk, 48,555; Skerries, 49,199, 49,576–7; Greenock, 49,935–53, 49,996–9, 50,239–46, 50,296–314; Inverary, 52,353–8, 52,990, 53,030–61, 52,659–66; Tarbert, 53,118, 53,123; London, 58,981–7.

Interference with shoals of—Ardrishaig, 51,788–94; Inverary, 52,331–44, 52,629, 52,904; Tarbert, 53,217–8, 53,362, 53,485–95, 53,508–11.

Destroyed by sprat fishing—Edinburgh, 26,701–5.

Gut-pock herrings—Peel, 35,012–4; Greenock, 50,268.

Harvest herrings—Torquay, 10,033–9.

Caught by hooks—Tarbert, 53,713–21.

Seasons—Cullercoats, 562–3, 654, 735; North Sunderland, 1949; Filey, 5683, 6064, 6247; Flamborough, 6469–73; Torquay, 9639, 9732–5, 9778–80, 9788, 9995–9; Ramsgate, 10,662, 10,667–9, 10,707, 10,712; Yarmouth, 11,915–7, 11,931, 12,018; Lynn, 14,751;

Fish (*continued*):—

Used for bait—Lowestoft, 14,177–80, 14,249–68, 14,339–48, 14,360–8, 14,376–9, 14,382–4; Brighton, 17,866; Campbeltown, 33,754–5; London, 60,799–800, 60,934.
Irish sold as Loch Fyne—Howth, 36,767–8.
Quality inferior—Billingsgate, 13,024, 13,035; Lowestoft, 13,981, 13,985; Stornoway, 32,444; Portree, 33,199–201; Campbeltown, 33,659, 33,773–6, 33,886, 34,045, 34,126, 34,151, 34,162.
Spent—Yarmouth, 11,918, 11,921, 11,986, 12,033–6, 12,255–7; Billingsgate, 13,105; Lowestoft, 14,313–5; Plymouth, 18,967–76, 18,978–81; Campbeltown, 33,774; Arklow, 38,189–90.
Taken too small—Lynn, 14,435, 14,457, 14,484, 14,715, 14,727, 14,813, 14,816; Brighton, 17,621–2, 17,826, 17,860, 18,052–3, 18,058, 18,076; Anstruther, 28,307–11; Inver, 46,442–6, 46,516–22; Inverary, 52,371.
Markets for — Yarmouth, 11,962, 11,981, 12,050, 12,092–5, 12,341–2; Lowestoft, 13,778–81, 13,846, 13,853–6, 14,400–1; Boston, 15,693; Hastings, 16,939; Brighton, 18,056; Arklow, 38,205–14; Wexford, 38,680–1; Greenock, 50,439–41; Ardrishaig, 52,204–7.
Proportion sent to market — Yarmouth, 11,981; Lowestoft, 13,851–2.
Exportation of — Yarmouth, 11,964–71, 12,096–7, 12,208, 12,325–49; Edinburgh, 26,316; Peterhead, 29,378–81; Wick, 30,244–5, 30,362–9; Lerwick, 31,901–5; Stornoway, 32,321, 32,635–6; Greenock, 50,409.
Importation of foreign—Greenock, 49,973–4, 50,181–5, 50,463–6.
Barrelled—Yarmouth, 12,029–30, 12,354–5; Edinburgh, 26,243; Wick, 30,743–52; Stornoway, 32,648.
Price of—Yarmouth, 12,122–8, 12,136–60, 12,205–6, 12,356–7; Lowestoft, 13,877; Lynn, 14,723; Hastings, 16,944; Stornoway, 32,358–63, 32,455–6; Campbeltown, 34,162; Peel, 34,446, 34,561, 34,934–41; Port St. Mary, 35,102; Howth, 36,769–70, 36,805–7; Kenmare, 42,179–80; Bantry, 42,839–42; Galway, 44,537–9, 45,665; Greenock, 49,939–53, 50,067, 50,296–314; Ardrishaig, 51,214–15, 51,342–55, 51,401–8; Inverary, 52,386–8, 52,667–74, 53,023–4; Ballantrae, 53,820*a*; London, 60,812.
Increase in price of—Cullercoats, 706–21, 1039; Newbiggin, 1511–3; North Sunderland, 2173–4, 2253–7, 2265–75; Sunderland 3140–6; Eyemouth, 27,801–8; Peterhead, 29,244; Greenock, 49,974; Fleetwood, 55,013–6.
Decrease in price of—North Sunderland, 1908, 2000; Yarmouth, 12,207, 12,344; Lowestoft, 13,777–80.
Stationary in price—Sunderland, 2846–54; Lowestoft, 13,776, 13,782–3.
Buyers — Lowestoft, 13,874; Stornoway, 32,608–12, 32,632.

Spring Herring Fishery:—

Yarmouth, 11,917–30, 11,986, 12,024–8, 12,098–9, 12,307, 12,380; Liverpool, 56,355–72.
Commencement and duration of—Lowestoft, 13,715–6, 13,743–4, 13,978–9, 14,071–3.
History and produce of—Lowestoft, 13,722–7, 13,900, 14,165.
Does not damage autumn fishing—Yarmouth, 11,930, 12,052–3, 12,100, 12,391.
Damages summer fishing — Yarmouth, 11,935–41, 12,170–9, 12,291–300; Lowestoft, 13,748.
Does not damage summer fishing—Lowestoft, 13,989–91.
Does not pay — Lowestoft, 13,738, 13,742, 13,745, 13,857–60.
Does pay—Lowestoft, 13,970–7, 14,049–51, 14,092–4, 14,246–9, 14,275–7, 14,294–300.
Restriction of, necessary — Yarmouth, 12,119–21, 12,301–5; Lowestoft, 13,764–9, 13,809, 13,865–6, 13,956–60, 14,011, 14,017–20.

Summer Herring Fishery:—

Interval between spring and summer — Lowestoft, 13,750.

FISH (*continued*):—

Summer Herring Fishery (continued):—

Falling off in—Yarmouth, 12,287–90; Lowestoft, 13,753–6, 13,760, 13,762–3, 13,900, 13,939–41, 13,997–9.
Smaller boats employed in—Lowestoft, 13,757.
Summer herrings can be salted—Lowestoft, 14,026.
Summer herrings not full—Yarmouth, 12,102–3.
Summer herrings sold as bloaters—Lowestoft, 14,385–6.
Most profitable — Anstruther, 28,300; Stonehaven, 28,851.

Autumn Herring Fishery:—

Yarmouth, 11,931, 11,942, 11,950, 12,101, 12,180–1; Lowestoft, 13,826–9.
Increasing—Lowestoft, 13,770–1, 13,902, 14,002–5.
The most valuable — Lowestoft, 13,785–6, 14,278, 14,381.

Winter Fishing:—

Lynn, 14,447, 14,450, 14,650, 14,652, 14,723; Dunbar, 27,351–6; Broughty Ferry, 28,791; Stonehaven, 28,850; Peterhead, 29,233–7, 29,361–7, 29,439–43, 29,563–7; Cromarty, 29,950–51, 30,128–35; Wick, 30,171–89, 30,222, 30,242–3, 30,373–5, 30,384–8, 30,500–3, 30,590, 30,655–8, 30,693–8, 30,796–8, 30,857–8, 30,887–9, 30,971, 31,069–73; Stornoway, 32,252–63, 32,405–7, 32,482, 32,756; Portree, 33,061, 33,179; Tobermory, 33,545–8; Campbeltown, 33,659, 33,728, 33,782–6, 34,178–80, 34,190, 34,244; Howth, 36,066–7; Arklow, 37,983; Wexford, 38,646–8; Inver, 46,293–8; Carrickfergus, 47,902–8; Carlingford, 48,379–82; Dundalk, 48,672.

Ling (see also "Cod and Ling"):—

Filey, 5692; Hull, 6893; Edinburgh, 26,739–45, 26,768, 26,845–7, 26,852–7; Anstruther, 28,295–9; Kirkwall, 31,545–7; Lerwick, 31,786–8, 31,792–4, 31,911–22, 31,968–73, 32,028–31; Stornoway, 32,264–70, 32,461, 32,694–6, 32,784, 32,803, 32,875, 32,944; Portree, 33,020, 33,095; Tobermory, 33,439; Campbeltown, 33,684–7; Dingle, 43,765; Westport, 43,837, 43,914; Inver, 46,256, 46,266; Skerries, 49,511; Greenock, 50,394, 50,398; Ballantrae, 53,820*a*.
Increase of—Anstruther, 28,296–7.
Decrease of—Staithes, 5280, 5536; Filey, 6196; Anstruther, 28,557; Broughty Ferry, 28,769–70; Peterhead, 29,473; Lerwick, 31,974; Portree, 33,099; Greenock, 50,674–6.
Average catch per day—Brixham, 8481.
Fishery, capable of improvement—Lerwick, 31,963–4; Portree, 33,101.
Stationary—Lerwick, 31,768.
Season for—Lerwick, 31,789–91, 31,965–6.
Price of—Lerwick, 31,916–20; Stornoway, 32,367–9, 32,463; Campbeltown, 33,762.

Lythe:—

Inverary, 52,274.

Mackerel:—

Cullercoats, 649–50, 950–3; Newbiggin, 1140, 1503–6; North Sunderland, 1771–3; Holy Island, 2575–6; Sunderland, 2798–810; Hartlepool, 4140–5, 4349–51; Filey, 5923–8, 6068–70; Flamborough, 6517–9, 6676–8; Brixham, 8234, 8864–72; Torquay, 9654, 9739–43, 9879–82; Yarmouth, 12,077–8, 12,381; Billingsgate, 12,894, 12,985–7; Lowestoft, 13,881–2; Brighton, 17,628–9, 17,722–3, 17,854–6, 17,907–10, 17,982–7, 17,990, 17,997; Plymouth, 19,123–5, 19,257–61, 19,321; Exeter, 19,731–4, 19,945–6; Wyke Regis, 20,022, 20,144, 20,255; Mevagissey, 22,478–83; Penzance, 24,415–23; Eyemouth, 28,122; Peel, 34,613, 35,003–7; Kingstown, 35,451; Howth, 36,097–9, 36,236–8, 36,719; Dunmore, 39,223–4; Dungarvan, 40,833–4; Kinsale, 41,181, 41,215, 41,323, 41,588–91; Ardrishaig, 51,659; Tarbert, 53,611–7, 53,729–54; Carnarvon, 56,413–5, 56,432; Tenby, 56,881–2; Swansea, 57,416.

Price of—Lynn, 14,597–600, 14,957–62, 15,065–8, 15,122–3; Boston, 15,376–81, 15,383–4.

Oysters (see also "Convention" and "Boats—oyster boats"):—

Beds—Holy Island, 2556; Brixham, 8315; Billingsgate, 13,358, 13,379–81, 13,409–10; Lynn, 14,630; Boston, 15,275–6, 15,488; Grimsby, 16,677–96, 16,713–48, 16,763, 16,768–9, 16,777, 16,802; Hastings, 16,915, 17,467; Brighton, 17,652; Torcross, 18,348–55; Exeter, 19,500–4, 19,565–7, 19,601–6, 19,611–2, 19,624, 19,628; Wyke Regis, 20,099–103, 20,112–3, 20,237–9, 20,516–8; Harwich, 20,645–79, 20,688–94, 20,740–8; Falmouth, 23,163–81, 23,212–25, 23,395; Shoreham, 25,259, 25,367–9, 25,424–30, 25,617–30, 25,642–8, 25,656–70; Edinburgh, 26,983–8, 27,206; Kirkwall, 31,232–40; Lerwick, 31,859–60; Stornoway, 32,299–308, 32,353–7, 32,481, 32,700, 32,712–5; Portree, 32,996, 33,080–4; Broadford, 33,339–41; Tobermory, 33,458, 33,532; Peel, 34,877–92; Kingstown, 35,470; Arklow, 38,101–5, 38,313, 38,351, 38,406–13; Wexford, 38,511–3, 38,583–6, 38,762–5, 38,786–8, 38,843, 38,871–3, 38,876–7, 38,969–72, 39,020–1, 39,024; Dunmore, 39,451–3; Dungarvan, 41,160–2; Kinsale, 41,679–88, 41,702–5; Kenmare, 41,864–9; Bantry, 42,661–70; Dingle, 43,770–2; Westport, 43,876–80, 44,004–7, 44,034–112, 44,343–56, 44,365–85; Galway, 45,885; Inver, 46,326–7; Moville, 46,650–1, 46,786–92, 46,799–806, 46,813–4, 46,846–9, 46,855–62, 47,124–8; Carrickfergus, 47,341–60, 47,514–22, 47,530–2, 47,535–7, 47,699, 47,703–5; Carlingford, 48,094, 48,124–8, 48,131–4, 48,143–55, 48,163–5, 48,256, 48,311–44, 48,372–3; Skerries, 49,216–24; Liverpool, 56,321–8; Carnarvon, 56,384, 56,391–400, 56,441; Tenby, 56,918–21, 56,939, 57,039–54; Swansea, 57,154–65, 57,167–9, 57,213–5, 57,285–7, 57,311, 57,622–8, 57,977–82; Whitstable, 58,056, 58,113–5, 58,232–3, 58,267, 58,297–304, 58,411, 58,438, 58,446, 58,470, 58,545, 58,548, 58,598, 58,678–80, 58,707, 58,743; Brightlingsea, 59,168, 59,170, 59,186–9, 59,335, 59,378, 59,408, 59,466–9, 59,476, 59,482–5, 59,499–506, 59,521–3, 59,533, 59,541, 59,544–8, 59,565–8, 59,573, 59,644, 59,665–6, 59,678, 59,700, 59,709–10, 59,718, 59,723, 59,768, 59,772; London, 61,136–8, 61,291, 61,294–7, 61,299, 61,319–20, 61,326–30, 61,371, 61,562, 61,595, 61,643–4, 61,658, 61,722, 61,727, 61,741–3, 61,749–50.

Exhaustion of beds—Whitstable, 58,267, 58,297–304; Brightlingsea, 59,394, 59,479–87, 59,579, 59,741–3; London, 60,352–60, 60,380, 60,384–93, 60,420, 60,436–7, 60,461, 60,522, 60,633, 61,653–4, 61,740–3.

Beds, how stocked—Whitstable, 58,078–9, 58,103, 58,108–10, 58,116–19, 58,130, 58,133–4, 58,184, 58,199, 58,205, 58,268, 58,273; Brightlingsea, 59,144–50, 59,261, 59,314–18, 59,370–1, 59,549, 59,743.

Protection of beds—Edinburgh, 26,992–7001; Brightlingsea, 59,116; London, 61,460–86, 61,751–61, 61,830.

Depredations on private grounds—Westport, 44,386; London, 60,478–9, 60,485–9, 61,645–8, 61,748, 61,751–61.

Seizure of oysters—Westport, 44,285–96.

Advantage of working beds of private companies—London, 61,301, 61,314, 61,457–60, 61,488–98,

FISH (*continued*):—
Shell Fish—Oysters (continued):—
61,574–7, 61,580–613, 61,617–28, 61,634–5, 61,662, 61,666–709, 61,720, 61,744, 61,814.
Beds covered with water—Grimsby, 16,808; Westport, 44,077; Moville, 46,849; Whitstable, 58,822–33.
Breeding places of—Exeter, 19,547–8, 19,561–3, 19,619–22, 19,703, 19,976; Carlingford, 48,154–5; Whitstable, 58,090–1.
Feeding grounds—Billingsgate, 13,376, 13,396; Shoreham, 25,968–72; Galway, 45,886; Swansea, 57,880–902.
Beds undeveloped—Edinburgh, 26,746–65, 26,776–87; Lerwick, 31,859; Dublin, 37,330–1; Wexford, 38,990; Bantry, 42,663; Inver, 46,326–7; Moville, 46,814.
Beds require rest—Wexford, 38,632–8; Kinsale, 41,683–4, 41,699; Westport, 44,242.
Removed in order to be laid down on other beds—Billingsgate, 13,371, 13,394–5; Grimsby, 16,697, 16,763–4; Exeter, 19,401–2, 19,695–9, 19,974–6; Harwich, 20,624, 20,682–5, 20,763; Arklow, 38,130–1, 38,169, 38,310–12, 38,351, 38,389–93; Wexford, 38,543–5, 38,610–4, 38,773–4, 38,814–6, 38,858–9, 38,865–70, 38,974–81, 39,029–30; Bantry, 42,665–7; Westport, 43,889, 43,928, 44,027–31, 44,040–1, 44,058, 44,118, 44,133, 44,178, 44,181–2, 44,327–32; Galway, 45,886; Moville, 46,833; Carlingford, 48,190, 48,316–9; Fleetwood, 55,040–6, 55,429–35, 55,503–55; Liverpool, 56,320–55; Carnarvon, 56,398–403, 56,437–40; Swansea, 58,013–25; Whitstable, 58,111–12, 58,130–4, 58,208–13, 58,248, 58,267–75, 58,414–21, 58,429, 58,456–9, 58,480–2, 58,492–505, 58,545–7, 58,603–5, 58,609, 58,682; Brightlingsea, 59,120, 59,190–3, 59,263–73, 59,522–3, 59,530–2, 59,599–60, 59,604, 59,667, 59,675; London, 59,941, 60,033–5.
Age of oysters—Billingsgate, 13,378; Penzance, 24,389; Shoreham, 26,040–4; Brightlingsea, 59,402–7, 59,526; London, 59,945–52, 59,971–2, 60,002–5, 60,444, 61,347–60, 61,364–8, 61,411–4, 61,548–51.
Size of when taken—Exeter, 19,409; Harwich, 20,682; Falmouth, 23,127–35, 23,255–9, 23,326, 23,413, 23,607; Shoreham, 25,190, 25,705–9; Edinburgh, 27,132–3; Dublin, 37,174–8; Arklow, 38,113–17, 38,252–6, 38,272–81, 38,314–6, 38,351, 38,395–6; Wexford, 38,618–22, 38,789–803, 38,806–11, 38,820–4, 38,852, 38,860–4; Kinsale, 41,597–8, 41,700–1, 41,707; Westport, 43,891–6, 44,121–4, 44,386–7; Moville, 46,834–46; Carrickfergus, 47,551, 47,706–9; Carlingford, 48,128–30, 48,139; Liverpool, 56,336, 56,343–8; Carnarvon, 56,435–7; Tenby, 56,540–3, 56,655–62, 56,922; Swansea, 57,172, 57,660–4; Whitstable, 58,201, 58,207–9, 58,271, 58,406, 58,490, 58,588–9, 58,627, 58,742; Brightlingsea, 59,118, 59,239, 59,507–8, 59,526; London, 60,201–12, 60,293–6, 60,433–4, 60,440–2, 60,605, 60,670–4, 60,694–7, 60,729–34, 61,649–50.
Small should not be removed—Exeter, 19,547, 19,549, 19,859; Wyke Regis, 20,109–11; Falmouth, 23,260–1; Wexford, 38,933–8; Kinsale, 41,706; Westport, 43,895, 43,898–9, 44,022–5; Carlingford, 48,424–6, 48,429, 48,445, 48,464, 48,468; London, 61,334–44, 61,369–70, 61,499–500.
Culling of, Regulations as to—Westport, 43,891, 44,299.
Culling of, observed—Westport, 43,890, 43,898, 44,022, 44,141–2, 44,145, 44,174, 44,186–7, 44,216; Moville, 46,825–7, 47,131; Carrickfergus, 47,714; Carlingford, 48,186, 48,430–1, 48,464; Tenby, 56,923–7.
Culling of, not observed—Westport, 44,101, 44,147; Carnarvon, 56,436.
Preservation of spat and brood—Whitstable, 58,092–5; Brightlingsea, 59,143–5, 59,157, 59,395–8, 59,719–25, 59,729–30; London, 59,922–3, 61,566, 61,641, 61,722, 61,725, 61,743.
Spat and brood where obtained—London, 61,415–21, 61,665, 61,745–9.
Growth of spat—Whitstable, 58,179–80, 58,236–8, 58,353–9, 58,541, 58,735; Brightlingsea, 59,399–401.
Weather favourable for spat—Brightlingsea, 59,132–9, 59,558–61.
Failure of spat—London, 60,063–4, 60,078, 60,121, 60,220, 60,251–3, 60,271, 60,286–92, 60,411.
Bad seasons for spat—Whitstable, 58,059–61, 58,125–7, 58,172, 58,222–5, 58,466, 58,474, 58,624; Brightlingsea, 59,218, 59,389, 59,449, 59,517; London, 61,310–3, 61,331, 61,526–7.
Injury to spat—London, 61,298, 61,318.
Good spat required—Billingsgate, 13,421; Harwich, 20,660–1; Falmouth, 23,436, 23,765.

FISH (*continued*):—
Shell Fish—Oysters (continued):—
A good spat—Arklow, 38,171–2; Westport, 44,151–2; Moville, 46,851; Carlingford, 48,423; Swansea, 57,208–13, 57,868–70; Whitstable, 58,060, 58,124, 58,486, 58,610; Brightlingsea, 59,104–7; London, 60,071–3, 61,664.
Spawning season of—Billingsgate, 13,406; Exeter, 19,977–82, 19,986, 19,995; Wyke Regis, 20,119; Harwich, 20,662, 20,976–7; Shoreham, 25,515–20, 25,689; Arklow, 38,126–7; Westport, 44,060; Whitstable, 58,084–5, 58,195–8, 58,320–1, 58,444, 58,488, 58,655; Brightlingsea, 59,152–3, 59,369, 59,556–63; London, 59,884–5, 60,303–4, 60,312, 60,634–5, 61,508–9.
Spawning in docks—Grimsby, 16,803–4, 16,824–6; London, 61,749–50.
May, advantage of, as an open month—Shoreham, 25,214–19, 25,470–3, 25,521–3, 25,689–91, 25,864–6, 25,873, 25,998; Edinburgh, 27,009; Arklow, 38,223–4, 38,353–6, 38,370–5, 38,384.
May should be included in close-time—Wexford, 38,547–8, 38,933, 39,022–3, 39,027; Carrickfergus, 47,543.
Condition of, in month of May—Wexford, 38,536–43, 38,768–73, 39,027; Carrickfergus, 47,542.
Artificial culture—Billingsgate, 13,373; Wexford, 38,961–73, 38,982–5; Moville, 46,803; Carrickfergus, 47,347; Carlingford, 48,145–8, 48,311–42; Whitstable, 58,305–10, 58,553–7; London, 59,848–922, 59,934–5, 59,941–87, 60,007, 60,016–49, 60,056–61, 60,071–2, 60,124–33, 60,245–56, 60,158–63, 60,189, 60,327, 60,332–5, 61,372–8, 61,394–7, 61,544–8, 61,720–9, 61,743–4.
Artificial culture successful—Dublin, 37,206–9; Whitstable, 58,610.
Artificial culture not successful—Billingsgate, 13,401; Falmouth, 23,461–2, 23,478; Dublin, 37,203; Moville, 46,803–6; Carrickfergus, 47,347–53; Whitstable, 58,658–64; Brightlingsea, 59,706–11; London, 60,272–7.
Ground adapted for beds—Dublin, 37,205, 37,323–9; Fleetwood, 55,520; Whitstable, 58,518–21; London, 61,406–10, 61,561, 61,826.
Ground fit for spat—Wyke Regis, 20,114–16; Harwich, 20,666–7; Shoreham, 25,499–504, 25,509–14, 25,671–7, 25,685; Whitstable, 58,665; Brightlingsea, 59,161–4.
Fecundity of oysters—London, 60,213–5, 60,462–6, 60,468–74.
Trawling injurious to (see "Trawling").
Spat and small oysters destroyed—Exeter, 19,476, 19,705–6, 19,851, 19,879–80, 19,988–90; Wyke Regis, 20,079, 20,117, 20,392–8; Harwich, 20,966–79, 21,214–40; Falmouth, 23,771–2; Wexford, 38,878–9; Kinsale, 41,603; Westport, 44,210, 44,231, 44,239, 44,457–60; Moville, 46,855; Carlingford, 48,107; Whitstable, 58,176–8, 58,200, 58,331–4, 58,427–8, 58,464, 58,606, 58,617–18; Brightlingsea, 59,159–60, 59,747–9, 59,758; London, 60,078–112, 60,121, 60,606–9, 60,699, 60,709, 60,712, 61,510, 61,543, 61,552–62, 61,740–1, 61,824.
Ground worked all the year—Harwich, 20,742–3.
Ponds and storing places—Shoreham, 25,192–209*a*, 25,316, 25,818–23, 25,837–51, 25,880–976; Westport, 44,068; Carlingford, 48,140–1, 48,479–81; Swansea, 57,727–41, 57,878, 57,994–6, 58,003–7; London, 59,954–80, 59,984–8, 60,018, 60,025, 60,036–49, 61,379–89.
Fresh water, effect of—Arklow, 38,134–6, 38,412–3; Westport, 44,071–3.
Effect of gale of wind on—Moville, 46,860–2; Carlingford, 48,358–65, 48,446–7.
Destroyed by five-fingers—Westport, 44,096–8; Whitstable, 58,103, 58,200, 58,397–402, 58,464, 58,606, 58,617–8; Brightlingsea, 59,160, 59,747, 59,758; London, 61,561–2, 61,824.
Indigenous—Exeter, 19,563–4, 19,854.
Close-time observed—Wyke Regis, 20,073–5; Shoreham, 25,853–63; Edinburgh, 27,006–9; Arklow, 38,128–9, 38,220–5; Wexford, 38,631; Kenmare, 41,868; Dingle, 43,771; Westport, 43,883–5, 44,018–21; Moville, 46,793–5; Carrickfergus, 47,538, 47,546–8, 47,669–71, 47,701; Carlingford, 48,105–10, 48,153, 48,176–83, 48,261–73, 48,410–20, 48,478; Carnarvon, 56,434; Tenby, 56,550–5, 56,653–4, 56,929; Swansea, 57,191–3, 57,301–2; Whitstable, 58,062–75, 58,281, 58,314; Brightlingsea, 59,175–6, 59,195–201, 59,213, 59,472–3; London, 60,616–20, 60,626, 60,646–64, 60,696–9, 61,502–5, 61,561–4, 61,740, 61,821.

Extension of close-time—Falmouth, 23,401–7, 23,548–50, 23,597, 23,769–70; Edinburgh, 27,008; Dublin, 37,167–72; Wexford, 38,874; Carlingford, 48,107, 48,176–83; Swansea, 57,199–207; Brightlingsea, 59,693–4.
Extension of open months—Shoreham, 25,370–1; Brightlingsea, 59,203, 59,374, 59,384, 59,411–5, 59,449–52, 59,608–14, 59,690–2, 59,799–806; London, 60,191–94, 60,222–41, 60,283, 60,301, 60,305, 60,396–400, 60,542, 60,579, 60,632, 60,644, 60,740, 61,561–2, 61,566, 61,571, 61,639–40, 61,654–7, 61,794, 61,816.
Mode of dredging—Shoreham, 25,571–600.
Kind of dredge—Shoreham, 25,277–9, 25,292, 25,300–1; Arklow, 38,262; Carrickfergus, 47,707, 47,716–21; Tenby, 56,953; Swansea, 57,175–86.
Cost of dredge—Shoreham, 25,295; Arklow, 38,257.
Number of dredges lost—Shoreham, 25,586–8.
Dredging season for—Arklow, 38,106–9; Wexford, 38,523–7, 38,609–10, 38,827.
Night-dredging—Shoreham, 25,291, 25,449–53, 25,680, 25,812–3; Arklow, 38,413–7, 38,421, 38,433; Westport, 44,236–8, 44,334–6; Carlingford, 48,500–1.
Dredging by strangers—Torcross, 18,359–63; Wyke Regis, 20,072, 20,076–81, 20,104, 20,237, 20,417–20, 20,452–7, 20,461–4; Harwich, 21,215–24, 21,256; Arklow, 38,142–7; Wexford, 38,755, 38,949–57.
Dredging prohibited in month of May—Wexford, 38,534, 38,775–9, 38,847–51.
Byelaw permitting dredging in month of May—Wexford, 38,528–33, 38,887–90.
Unrestricted dredging—Wexford, 38,618, 38,623–30.
Dredging by steamboats—Shoreham, 25,262–6; Dunmore, 39,457–63; London, 60,652, 60,664.
Dredging injurious to—Torcross, 18,355–63; Falmouth, 23,529–44, 23,771–2; Penzance, 24,390, 24,392–6; Wexford, 38,852–6, 38,949; Swansea, 57,640–8, 57,866–7, 57,870; London, 60,414, 60,577, 60,589, 60,592–4, 60,601, 60,613–14, 60,622–5, 60,640–2, 60,658, 60,666–7, 60,352–60.
Dredging not injurious to—Brightlingsea, 59,294–300.
Dredging advantageous to—Grimsby, 16,781–2; Harwich, 20,700–702; Shoreham, 25,833–6; Arklow, 38,351, 38,441; Moville, 46,859–60; Swansea, 57,311–2; Whitstable, 58,099–101; Brightlingsea, 59,475–81, 59,756–8, 59,762–5.
Arrangement as to shares—Shoreham, 25,565–70.
Decrease in supply of—Brixham, 9262; Torquay, 9668, 9865–70; Billingsgate, 13,348–9, 13,366–8, 13,397–8; Boston, 15,274–80, 15,489, 15,718–25; Brighton, 17,652–6; Torcross, 18,356; Exeter, 19,406, 19,611–3, 19,695, 19,704, 19,851, 19,879–80, 19,996, 20,005; Wyke Regis, 20,071, 20,391, 20,423–5; Harwich, 20,697–8, 20,738–9; Falmouth, 23,098–100, 23,382, 23,436, 23,645–6, 23,780–1; Shoreham, 25,181, 26,017–23; Dublin, 37,179–92; Wexford, 38,550, 38,587–94, 38,603–9, 38,846, 38,928–32; Kinsale, 41,596–603; Westport, 44,116–8, 44,131–7, 44,208–10, 44,231–2; Moville, 46,813, 46,852–60; Carlingford, 48,236–9, 48,245–9, 48,450–1; Liverpool, 56,320; Tenby, 56,532–9, 56,546, 56,600–1, 56,917, 56,933, 57,009–13, 57,085–6; Swansea, 57,629–38, 57,864; Whitstable, 58,059–61, 58,124–8, 58,171–2, 58,222, 58,245, 58,267, 58,289–95, 58,466, 58,469, 58,474, 58,553–7, 58,624; Brightlingsea, 59,097–103, 59,109–10, 59,113, 59,122–9, 59,167, 59,325, 59,394, 59,482–4, 59,504, 59,517, 59,525, 59,606, 59,703–7; London, 60,323–4, 60,367, 60,564–70, 60,767–8, 61,166, 61,799–800, 61,804.
Increase in supply of—Brixham, 9262; Harwich, 21,045, 21,051–3; Shoreham, 25,365–9, 25,641, 25,801–2; Edinburgh, 27,010–13; Arklow, 38,118–23, 38,307–8, 38,439–41; Wexford, 38,754–5, 38,843–5; Kenmare, 41,869; Westport, 43,882, 43,894, 44,017, 44,065, 44,161–3; Moville, 46,798–9, 47,114–6, 47,125; Carrickfergus, 47,343, 47,360, 47,515, 47,531, 47,699; Carlingford, 48,110, 48,356–8, 48,369–70, 48,408, 48,439; Swansea, 57,167–9, 57,311.
Supply of ought to be increased—Stornoway, 32,476; Portree, 33,171; Tobermory, 33,535–7; Kinsale, 41,700.
Fishing profitable—Shoreham, 25,373.
Fishing not profitable—Tenby, 57,015, 57,089–90.
Supply of formerly—Arklow, 38,119–23, 38,217–19, 38,307–8, 38,439–41; Westport, 44,017; Carrickfergus, 47,530; Carlingford, 48,449; Carnarvon, 56,444; London, 60,691–2, 61,782–3, 61,788, 61,800–2, 61,804.
French competition for—Billingsgate, 13,383–8, 13,414; Exeter, 19,404–6, 19,476, 19,851; Shoreham, 25,530–8; Wexford, 38,974–81, 39,029–30; Liverpool, 56,347–8; Whitstable, 58,567–83, 58,595; Brightlingsea, 59,595.
Increased demand for — Brightlingsea, 59,346–54, 59,386–8, 59,769; London, 60,677, 61,595, 61,786–7.
Best means for increasing supply—London, 60,669, 60,734–9, 60,741, 60,757–64.
Sold out of season—Whitstable, 58,087, 58,267, 58,276, 58,284, 58,628–43; London, 60,495–505, 60,753–5, 61,564, 61,771.
Produce of French beds—London, 60,024.
Produce of English beds—London, 60,299.
Price of — Billingsgate, 13,348, 13,354–5, 13,386; Grimsby, 16,793; Exeter, 19,401–6, 19,473, 19,609, 19,695–8, 19,859; Harwich, 20,758–60, 21,026; Falmouth, 23,192–5, 23,451–2, 23,780–1; Shoreham, 25,237–45, 25,343–53, 25,537–8, 25,903–7; Arklow, 38,166, 38,173–81, 38,309, 38,436–8; Wexford, 38,596; Westport, 44,091–5, 44,153–9, 44,177; Moville, 46,809–10, 47,117–121; Carrickfergus, 47,523–5; Carlingford, 48,288, 48,366–7, 48,486; Fleetwood, 55,535, 55,543; Liverpool, 56,339–41; Tenby, 56,544–5, 56,946–7; Swansea, 57,214–6, 57,903–6, 57,992–3; Whitstable, 58,214, 58,227–30, 58,263, 58,296, 58,407–9, 58,556, 58,582–7, 58,595–6; Brightlingsea, 59,112, 59,424–31, 59,783; London, 60,006, 60,012–5, 60,020–4, 60,031, 60,299, 60,313, 60,446–50, 61,613, 61,784–5, 61,804–5.
Brood, cost of—Whitstable, 58,342–6, 58,561; London, 60,682–6, 60,689, 61,664.
Quality of — Stornoway, 32,479, 32,713; Portree, 33,014; Broadford, 33,329–32, 33,409–26; Kinsale, 41,696; Moville, 46,913–6; Carrickfergus, 47,540–2; Carlingford, 48,319–20, 48,415–7; Liverpool, 56,336–7; Swansea, 57,194–8; Whitstable, 58,122–3, 58,231, 58,269–70, 58,447–55, 58,461–3, 58,511–12, 58,534–40, 58,548, 58,646–8, 58,651, 58,737–41; Brightlingsea, 59,183, 59,453–4, 59,551–5, 59,731, 59,768, 59,772; London, 60,196–201, 60,216, 60,302, 60,310–2, 60,314–18, 60,475–7, 60,577–8, 60,584, 60,587, 61,426, 61,773–4.
Unfit to eat in spawning season—Grimsby, 16,785–92; Exeter, 19,995.
Convention, operation of—(see "Convention").
Devon (Earl of), rights of—Exeter, 19,601–4, 19,611–2, 19,617, 19,623–4, 19,628–33.
Memorial to Board of Trade—Shoreham, 25,747.
Opinion of law officers as to Act in reference to—Falmouth, 23,329.
Kinsale Local Act—Kinsale, 41,676–8, 41,687–95.

Change in mode of—Cullercoats, 497–507; Sunderland, 2778, 2783–5; Hartlepool, 4226–33.

FISHING (*continued*):—
Influence of weather on—Cullercoats, 97–9; Newbiggin, 1161–70, 1348–9, 1615; North Sunderland, 1740–4, 1929, 1935, 2030–3; Holy Island, 2590–1; Sunderland, 2906–10; Kirkwall, 31,579–84; Lerwick, 32,152; Tenby, 56,829–32, 56,862–5.
Injured by steamboats—Ramsgate, 11,074–7; Edinburgh, 26,678–9; Peterhead, 29,582; Kingstown, 35,953–4, 35,972; Dunmore, 39,367–9; Greenock, 50,478–9; Inverary, 52,982–4.
Improved system of—Staithes, 5084.
No improved system of—Filey, 6087, 6089–92.
Profitable—Edinburgh, 26,872, 26,889; Broughty Ferry, 28,783; Wick, 30,545–7; Kirkwall, 31,385; Tenby, 56,643.
Not a paying business—Billingsgate, 12,763–77.
Prosecuted with skill—Wick, 30,271.
Advances injurious to fishermen—Kirkwall, 31,386–93.
Over-fishing—Cullercoats, 667–71; Newbiggin, 1201, 1648; North Sunderland, 1778–80; Holy Island, 2549–50, 2618–9; Hartlepool, 4355–7.
Drift-net Fishing (see also "Herrings" and "Herring-nets"):—
Mevagissey, 22,072–3; Penzance, 24,002, 24,092–4, 24,109, 24,147–53, 24,213, 24,246–7, 24,301, 24,399–402, 24,494, 24,586, 24,602; St. Ives, 24,747, 24,958–64; Greenock, 50,789, 50,876–7; Ardrishaig, 51,002–39, 51,180–8; Inverary, 52,470–85, 52,743–4, 52,747–52.
Improved by stoppage of trawling—Galway, 44,694–95, 44,707, 44,709, 45,017–18, 45,026, 45,029, 45,276–78, 45,281, 45,304, 45,645, 45,717–18, 45,814; Inver, 46,182; Greenock, 50,653*a*.
More profitable than trawling for herrings—Ardrishaig, 51,149–59; Inverary, 52,860–1.
Hand-line Fishing:—
Hull, 7315–25, 7986–9; Billingsgate, 12,826, 12,939–45, 12,973, 13,301; Grimsby, 16,632; Polperro, 21,305–10; Lerwick, 31,753; Dungarvan, 39,921–4, 39,989, 40,394–402, 40,549–54, 40,722–6, 40,784–91, 41,030–3; Greenock, 50,692.
Long-line Fishing:—
Cullercoats, 27–31, 352–8; Newbiggin, 1151–9, 1222–8; North Sunderland, 1701*a*, 1712; Holy Island, 2407; Sunderland, 2760–5; Flamborough, 6620–1; Brixham, 8265, 8283–7, 9310–17; Yarmouth, 11,768–86; Grimsby, 16,383, 16,402; Brighton, 17,871–2; Harwich, 20,773–803; Edinburgh, 26,657–65, 27,046–7; Dunbar, 27,327–30, 27,335–6; Eyemouth, 28,082; Anstruther, 28,567; Peterhead, 29,475; Cromarty, 29,789, 29,925; Kirkwall, 31,205–7, 31,241–5; Ringsend, 37,463–5, 37,590–1; Arklow, 38,086–96; Wexford, 38,496, 38,727–30; Dungarvan, 39,990–40,000, 40,015–20, 40,187–9, 40,346–55, 40,387–9, 40,521–7, 40,545–7, 40,646–52, 40,727–8, 40,843–4; Kinsale, 41,187–8, 41,258–60, 41,268, 41,439–40; Kenmare, 41,740–45, 41,753, 41,808–11, 41,957, 41,985–86, 42,259–62; Bantry, 42,778, 42,853–54; Dingle, 42,953–54, 43,253–6, 43,416, 43,448–9, 43,465–75, 43,565–68, 43,713–8, 43,748–50; Westport, 44,421; Galway, 45,012; Inver, 46,131, 46,136–37, 46,339–47; Moville, 46,995, 47,107–09; Carrickfergus, 47,287–89, 47,753–60, 47,767–69; Carlingford, 48,350–52; Dundalk, 48,538–39, 48,646–48, 48,676, 48,706, 48,720–21, 48,768–69; Skerries, 49,266, 49,287–88, 49,331, 49,405–07, 49,509–13, 49,696–97; Greenock, 50,030–5, 50,056; Dumfries, 53,890–4; Morecambe, 54,798–808, 54,832–9, 54,892–3; Carnarvon, 56,415; Tenby, 56,993, 57,029–30; Swansea, 57,776–85, 57,966–9.
Want of bait for—Wick, 30,213, 30,598–9, 30,609–10; Ardrishaig, 52,133, 52,234–40; Inverary, 52,756–7.
Increase of—Billingsgate, 12,440, 12,489; Lowestoft, 14,213; Plymouth, 18,752, 19,006, 19,247; Anstruther, 28,253–9, 28,420; Peterhead, 29,463–4, 29,641.
Decrease of—Sunderland, 3112–5, 4044; Filey, 5695–6; Ramsgate, 10,646; Polperro, 21,301–5, 21,331; Mevagissey, 22,441–9; Penzance, 24,039–41, 24,073, 24,571–2; Peterhead, 29,344, 29,532; Cromarty, 29,783–6; Kirkwall, 31,177–8; Kenmare, 42,036, 42,162, 42,295–99; Bantry, 42,462, 42,615, 42,780, 42,852, 42,855, 42,859–60; Dingle, 43,655; Inver, 46,252–53; Carrickfergus, 47,321, 47,433–38, 47,882–84; Carlingford, 48,156–7, 48,303–04; Skerries, 49,069, 49,174–77; Greenock, 49,889–99, 50,384, 50,675, 50,718; Tarbert, 53,400.
Cause of decrease—Bantry, 42,615, 42,780–81, 42,861–66; Inver, 46,254; Dundalk, 48,536–37.
Season for—Hull, 7326–7, 7736; Ramsgate, 10,970;

FISHING (*continued*):—

Long-line Fishing (continued):—

Grimsby, 16,380; Polperro, 21,329, 21,502–06; Galway, 45,519; Carrickfergus, 47,817–19; Skerries, 49,489, 49,494, 49,498–99; Tenby, 57,104.

Objections to long-line fishing—St. Ives, 24,995, 25,004; Dungarvan, 39,994–40,000, 40,189–90, 40,389–90, 40,976–82, 41,023–5.

Kinds of fish caught by—Bantry, 42,851, 42,856–57; Dingle, 42,964–77, 43,120–21, 43,361–61*a*; Westport, 43,819, 44,423; Inver, 46,348–51, 46,542; Carrickfergus, 47,403–5, 47,694–97; Carlingford, 48,299–302; Dundalk, 48,525; Skerries, 49,267, 49,489–97; Balbriggan, 49,832–33.

Profitable—Sunderland, 2834; Hartlepool, 4049–50; Staithes, 5025–8.

A bad speculation—Hull, 7259–62.

Length of lines—Grimsby, 16,401; Anstruther, 28,404; Stonehaven, 28,892; Wick, 30,530.

Seine Fishing (see also "Trawling for Herrings"):—

Exeter, 19,793, 19,832–4; Mevagissey, 22,032–60, 22,585–92; Wexford, 38,509; Kinsale, 41,640–2; Bantry, 42,671, 42,837, 42,877–8, 42,921; Dingle, 42,980, 42,994–6; Westport, 43,820; Inver, 46,327–30; Carnarvon, 56,479–80; Tenby, 56,880.

Decrease in—Polperro, 21,699–702, 21,833–8; Mevagissey, 21,991–4; Penzance, 24,003, 24,276–8; Bantry, 42,922–5.

Custom as to "turns" and "stems"—Mevagissey, 22,413–6, 22,947–52; Falmouth, 23,680–93; Penzance, 24,113–7, 24,168–88; St. Ives, 24,691–733, 24,756–9.

Injurious effects of seining—Lynn, 14,695; Brighton, 17,517, 17,549–50, 17,630, 17,764, 17,776, 17,934; Exeter, 19,441, 19,950; Wyke Regis, 20,047–51; Mevagissey, 22,412, 22,966; Falmouth, 23,620–1, 23,732–3, 23,828; Kingstown, 35,692, 35,776–80.

Injured by drift-net fishing—Polperro, 21,456; Penzance, 24,110; London, 58,963–5.

Capital required for—Mevagissey, 22,424, 22,927; St. Ives, 24,773.

Not profitable — Mevagissey, 22,393–400, 23,002, 23,018; Penzance, 24,342, 24,497–8.

Regulations as to—Mevagissey, 22,370–2, 22,643–73, 22,685–704, 22,830–2, 22,904–12, 22,998–70, 23,006, 23,024.

Men employed in, chiefly landsmen — Penzance, 24,313–4.

Objections to small seines—Mevagissey, 22,834–56, 22,883, 22,892–902; Penzance, 24,118–36, 24,189–207, 24,372–6.

Disputes between owners of large and small seines—Mevagissey, 22,914–20; Falmouth, 23,874–85; Penzance, 24,208–12, 24,315–21.

FISHING COMPANIES AND CLUBS:—

Cullercoats, 577–91; Hull, 7251; Brixham, 8022–68; Plymouth, 19,034–75; Ringsend, 37,533, 37,911–5; Dunmore, 39,813–5; Dingle, 43,775; Galway, 46,015–23, 46,087, 46,098–106; Carrickfergus, 47,569, 47,601–09, 47,740–42; Liverpool, 55,704.

FISHING GROUNDS:—

Cullercoats, 247, 508–11, 667, 1008, 1018–22; Newbiggin, 1418–22, 1529–33; Sunderland, 2896–905, 3266, 3285, 3431–4, 3894, 3959–61; Hartlepool, 4212, 4363, 4697–9; Staithes, 5041, 5073–7, 5265–75; Hull, 6887, 7496–9; Ramsgate, 10,539–45, 10,557–9; Billingsgate, 12,433, 13,159–61, 13,190; Edinburgh, 26,681; Dunbar, 27,335–6, 27,553; Anstruther, 28,543–50, 28,556; Broughty Ferry, 28,700–1, 28,759–67; Peterhead, 29,448, 29,568–9, 29,608–10, 29,612–7, 29,706, 29,718–20; Cromarty, 29,777–81, 29,863–6; Wick, 30,193, 30,233–8, 30,466–71; Kirkwall, 31,183–4, 31,396, 31,446, 31,610; Lerwick, 31,755, 31,802–9, 31,851–2, 31,981–7; Howth, 36,261; Ringsend, 37,384–6, 37,421–9, 37,465–9, 37,504–7, 37,521–40; Dunmore, 39,083–6, 39,631–6, 39,663–5; Kinsale, 41,334–8; Kenmare, 41,899–905, 41,949–53, 41,989–96, 42,002–3, 42,184–209, 42,233–5, 42,242, 42,266–8, 42,270–2, 42,319–21; Bantry, 42,508–12, 42,574–80, 42,583, 42,791, 42,793; Dingle, 43,040–41, 43,208–10, 43,219–20, 43,238–43, 43,372–78, 43,381–89, 43,592–601, 43,784–87; Westport, 43,913; Galway, 44,576–8, 45,037–46, 45,066–67, 45,282–89, 46,041–43, 46,117–19; Inver, 46,225–26; Moville, 46,615–35, 46,706–26, 46,745–49, 46,873–78, 46,903–11, 46,966–72, 47,192–6, 47,220–3, 47,233–41; Carrickfergus, 47,311–20, 47,501, 47,577–8, 47,662, 47,929–30, 47,939–56, 47,972–85; Carlingford, 48,158–62, 48,292; Dundalk, 48,528, 48,952–65, 48,992–3; Skerries, 49,309, 49,631; Balbriggan, 49,845–9; Liverpool, 55,668–72, 55,754–60, 55,961–6,

FISHING GROUNDS (*continued*):—

56,004–9, 56,048, 56,193–5; Carnarvon, 56,388–9; Tenby, 57,109–10, 57,131–5.

Continuance on — Sunderland, 3383–96, 3495–504; Hartlepool, 4848–51; Brixham, 8078.

Comparative advantages of—Cullercoats, 247; Sunderland, 3227–9, 3235–8, 3380–2, 3433–9, 3780–2.

Not over-fished—Hull, 7162, 7501–2, 7561, 7595, 7934, 7956; Ramsgate, 10,350–1; Yarmouth, 11,289–91, 11,739, 11,741, 11,845–7; Billingsgate, 12,860–1, 13,262; Lowestoft, 14,207–9; Grimsby, 16,128, 16,320.

Require protection—Plymouth, 18,611.

Fished according to season—Hull, 7447; Yarmouth, 11,307.

As productive as ever—Hartlepool, 4847–51; Hull, 6910–13; Billingsgate, 12,695; Hastings, 16,900, 17,054, 17,154–5, 17,269, 17,336; Liverpool, 56,145–6.

Less productive—Sunderland, 3959; Staithes, 5066, 5073–6, 5655–72; Filey, 5705–8, 5714–28; Flamborough, 6651–8; Hull, 6903–5; Billingsgate, 13,469; Grimsby, 15,914–5, 15,949–55, 16,455–6; Plymouth, 18,611–82, 18,920, 19,249, 19,297–300; Harwich, 20,566–9; Broughty Ferry, 28,766–9; Moville, 46,614; Greenock, 50,522–7.

Limitation of—Cullercoats, 418, 929–34; North Sunderland, 2280–1; Sunderland, 2950–3, 3138; Staithes, 5259; Filey, 6298–9; Plymouth, 18,852–6; Mevagissey, 22,968–84, 23,006–7, 23,023–34; Penzance, 24,147–53; Edinburgh, 26,204–23; Howth, 36,222, 36,264–74, 36,404; Dublin, 37,110–33; Ringsend, 37,470–2; Arklow, 38,378; Dungarvan, 40,111; Kenmare, 41,994, 42,002–3, 42,183–209, 42,232–5, 42,243, 42,250, 42,291–92, 42,365–69, 42,376–77; Bantry, 42,584–94, 42,631–33, 42,697, 42,701, 42,789, 42,847, 42,867–69, 42,873–76, 42,899–901, 42,910; Dingle, 43,062–75, 43,079–85, 43,207, 43,218, 43,221–23, 43,257–58, 43,264–7, 43,348–9, 43,519–28, 43,777; Galway, 44,472–77, 44,646–52, 44,850–57, 45,707–11, 45,860–61, 45,917–21, 46,048–53; Inver, 46,166, 46,177–79; Moville, 46,910; Carrickfergus, 47,490–91, 47,843–45, 47,847–49; Carlingford, 48,213, 48,397–98; Skerries, 49,117–21, 49,480, 49,606; Tarbert, 53,228–32; Liverpool, 55,682.

Aberdeen Bay:—

Peterhead, 29,528–30, 29,761.

Achill Sound:—

Westport, 43,858, 43,867, 43,891, 43,913–4.

Aldborough Bay:—

Harwich, 20,581.

Anascaul:—

Dingle, 43,203, 43,481–2, 43,784.

Ardglass:—

Howth, 36,503; Arklow, 37,987, 38,069.

Arklow:—

Howth, 36,777–93; Arklow, 37,933–38,441; Wexford, 38,680–3.

Arran Islands:—

Ringsend, 37,526; Galway, 44,474, 44,683, 44,812, 44,821–5, 45,006, 45,029, 45,033, 45,049, 45,281, 45,632, 45,749, 45,807–12, 45,920, 45,986.

Back Knoll:—

Billingsgate, 13,189.

Ballantrae:—

Ballantrae, 53,820*a*.

Bantry Bay:—

Kinsale, 41,569–70; Bantry, 42,409–942; Galway, 44,548–53, 46,042.

Barnstaple Bay:—

London, 58,753, 59,022.

Barra:—

Harwich, 20,881; Portree, 33,062, 33,095–113; Tobermory, 33,447.

Beachy Head:—

Hartlepool, 4697; Brighton, 17,803–10; Shoreham, 25,415–25, 25,637–9, 26,020–2.

Belfast Lough:—

Carrickfergus, 47,278–48,089.

Berwick Bank:—

Holy Island, 2472–6, 2616–22; Grimsby, 16,555–9.

Blackrock:—

Polperro, 21,486.

Blacksod Bay:—

Westport, 43,891.

Blackwater:—

Billingsgate, 13,409; Harwich, 20,864, 21,147; Shoreham, 25,706; Brightlingsea, 59,023, 59,839.

FISHING GROUNDS (*continued*):—

Blackwater:—
Wexford, 38,569–75, 38,688–90.

Bolt Head:—
Polperro, 21,340.

Boston Deeps:—

Injured by sinking—Cromarty, 29,993–30,002.
Injury done by—Ardrishaig, 52,224–30.
Cost of—Hastings, 17,446–7; Mevagissey, 22,069–70; Howth, 36,145, 36,748; Dingle, 42,956, 43,138.
Increase of—Exeter, 19,894; Eyemouth, 28,168–9; Stonehaven, 28,859; Dingle, 43,137.
Decrease of—Brixham, 9122.
Fleet of—Dunbar, 27,490; Peterhead, 29,406*a*; Cromarty, 29,815, 29,917–9; Wick, 30,544, 30,551–4; Kirkwall, 31,441; Arklow, 38,040, 38,227.
Improvement of—Peterhead, 29,200–42, 29,334.
Illegal use of, prevented—Edinburgh, 26,282–5.
Regulations, absence of—Cullercoats, 593–616; Flamborough, 6489; Lowestoft, 13,904–5; Mevagissey, 22,318–20.
Regulations required—Newbiggin, 1362–6; Flamborough, 6706–8, 6854.
Regulations not required—Lowestoft, 13,906.
Shrinking of—Lowestoft, 13,830–1, 14,023, 14,108–12, 14,286–91; Edinburgh, 26,285.
Shooting of (see also "Convention," "Sunset Regula-

NETS (*continued*):—

Herring Nets (continued):—
tions")—Cullercoats, 1077; Newbiggin, 1177–8, 1497–502; North Sunderland, 1826–8; Hartlepool, 4216–20; Staithes, 5341–5; Stonehaven, 28,872–6; Ardrishaig, 51,002–14, 51,020–38; Inverary, 52,486–501.
Grounded — Dunbar, 27,344, 27,376–9, 27,390–2, 27,641–59.
Not grounded—Howth, 36,111–3, 36,158.

Herring Trawl Nets (see "Seine Nets").

Horse Trawl Nets:—
Brixham, 8298, 9206–13, 9215–17; Torquay, 9678–83, 9881–95.

Hurdle Nets:—
Morecambe, 54,637–42.

Kettle Nets:—
Hastings, 17,087–90, 17,092, 17,096, 17,106–11, 17,137, 17,471.
Increase in—Hastings, 17,178.
Cost of—Hastings, 17,100–2, 17,113.
Fish caught by—Hastings, 17,115.
Mesh, size of—Hastings, 17,091, 17,124–6.
Losses by—Hastings, 17,099, 17,120.
Profits by—Hastings, 17,116–9, 17,138.

Launce Nets:—
Torcross, 18,335.

Mackerel Nets:—
Brighton, 17,604–19.
Destroyed by trawlers—Brixham, 8788–95; Torquay, 9448–55.
Size of — Ramsgate, 11,040; Yarmouth, 12,080; Brighton, 17,700–2; Wyke Regis, 20,182–3, 20,210–6; Polperro, 21,915–6.
Increase of—Wyke Regis, 20,191–6.
Number of—Exeter, 19,944; Wyke Regis, 20,191–3.
Cost of—Wyke Regis, 20,189.
Mesh of — Yarmouth, 12,079; Brighton, 17,604, 17,609–12, 17,619–20, 17,700; Plymouth, 19,323; St. Ives, 24,822–8.

Peedle Nets:—
Dumfries, 53,965.

Pilchard Nets (see also "Seine Nets"):—
Plymouth, 18,925–6, 18,955–7; Polperro, 21,324–7, 21,535–49, 21,674–6, 21,696; Mevagissey, 22,211–8, 22,225–36; Falmouth, 23,347, 23,674–8; Penzance, 23,994–8.
Length of—Polperro, 21,915–6.
Mesh, size of — Brixham, 9348, 9352; Plymouth, 18,960.
Size of—St. Ives, 24,800–5.
Not improved for 600 years—Wexford, 38,996–7.

Pope Nets:—
Dumfries, 53,963, 53,966–76.

Salmon Nets:—
London, 58,861–2.

Scringe Nets (see also "Circle Nets" and "Seine Nets"):—
Tobermory, 33,478–91.

Seine Nets (see also "Pilchard Nets," "Circle Nets," "Scringe Nets," "Mackerel Nets," and "Tuck Nets"):—

Brixham, 8321–5, 8327–33, 8339; Lynn, 14,481, 14,643–4, 14,656–8, 14,660, 14,716–8; Boston, 15,244–5, 15,256; Brighton, 18,022–5, 18,104–5; Exeter, 19,527; Morecambe, 54,937; Liverpool, 55,731–9, 55,867–76, 55,934–6, 56,050–2, 56,181; Carnarvon, 56,420; London, 61,093–8.
Destroy small fish—Ramsgate, 10,680–3, 10,865–71, 10,917–21; Lynn, 14,643; Brighton, 18,014, 18,021; Plymouth, 19,029.
Size of—Lynn, 14,528; Brighton, 18,103, 18,107; Liverpool, 55,735–9, 55,870.
Mesh, size of—Brixham, 8326; Morecambe, 54,938–9, 54,944–6; Brightlingsea, 59,819; London, 61,090–1.

Smelt Nets:—
London, 61,070–3.

Sole Nets:—
Lynn, 14,480, 14,653–5; Boston, 15,235–40, 15,526, 15,532; Morecambe, 54,888, 54,901–3.
Fish injured by—Lynn, 14,634.

Sprat Nets:—
Torquay, 9749–76; Ramsgate, 11,023–6; Exeter, 19,531–3, 19,553–6; Inver, 46,413–8, 46,476–9, 46,490; Swansea, 57,794–805, 57,830–3.

Stake Nets:—
Dumfries, 53,877–88, 53,915–28, 53,945, 54,007–15, 54,153–64, 54,184–7, 54,236–8, 54,494; Fleetwood, 55,019, 55,387–403; Swansea, 57,329, 57,335–7, 57,400–10.
Destruction of fish by—Dumfries, 53,929–39, 54,410–14; Swansea, 57,333–7.
Not as profitable as trawling—Dumfries, 54,417–22.

Stop Nets:—
Swansea, 57,762–4, 57,939, 57,942–3.

Stow Nets:—
Ramsgate, 10,865, 10,894, 10,897–8; Lynn, 14,815.
Increase in—Lynn, 14,576–7, 14,736; Boston, 15,395, 15,534.
Fish caught in—Lynn, 14,680, 14,684–9.
Destroy spawn—Ramsgate, 11,057.
Mesh, size of—Ramsgate, 10,875–6, 10,896; London, 61,085–6.
Should be abolished—Lynn, 14,698.

NETS (*continued*):—

Taaf Nets:—
Portree, 33,225–33.

Team Nets (see also "Seine Nets"):—
Wyke Regis, 20,158–81, 20,402, 20,443–4, 20,446–9.

Trammel Nets (see also "Set Nets"):—
Arklow, 37,992–38,000; Dungarvan, 39,931–7, 39,946–57, 40,033–5, 40,089–111, 40,328–9, 40,338–9, 40,422–33, 40,528–36, 40,559, 40,707–9, 40,716–22, 40,726, 40,737, 40,765–9, 40,890–906, 40,950, 41,028–9, 41,060–4, 41,121–3; Kinsale, 41,196–7, 41,235–6, 41,300–7, 41,557; Kenmare, 41,723, 41,731, 41,735, 41,739, 41,747, 41,800, 41,845, 41,855, 41,857, 41,880, 41,884, 41,963–69, 41,972, 41,990, 42,004, 42,011–2, 42,050, 42,056, 42,108, 42,125, 42,192–93, 42,250, 42,254, 42,279, 42,290, 42,307, 42,312, 42,316–17, 42,320, 42,323–24, 42,327, 42,330–36, 42,344, 42,347, 42,356–8, 42,360–2, 42,371, 42,375, 42,397–8, 42,401–2; Bantry, 42,420–2, 42,424–29, 42,448–51, 42,469, 42,475–76, 42,481, 42,485, 42,494–5, 42,497, 42,499–501, 42,503–04, 42,506–07, 42,549–52, 42,650–51, 42,696, 42,726, 42,790; Dingle, 42,960–63, 43,007–8, 43,010–11, 43,013–18, 43,027–28, 43,390–93, 43,416, 43,446–47, 43,478–82, 43,667, 43,718; Inver, 46,150–51, 46,160–65, 46,207–9, 46,369, 46,432–35, 46,455, 46,460, 46,464–74, 46,480, 46,486–89, 46,494–506; Greenock, 50,710; Ardrishaig, 52,240–7; Swansea, 57,329.
Injurious effects of—Dungarvan, 39,923–5, 39,939–42, 40,080–8, 40,115–34, 40,197–200, 40,202–26, 40,244, 40,261, 40,315–24, 40,340–5, 40,404–6, 40,414–5, 40,418–9, 40,516–7, 40,534–6, 40,597, 40,612–25, 40,663–4, 40,668–71; Kinsale, 41,237–42, 41,269; Kenmare, 42,377; Bantry, 42,505, 42,619, 42,684, 42,725–8, 42,928–9; Dingle, 43,019–20, 43,276–7; Inver, 46,210, 46,370–4, 46,411, 46,420, 46,481–5.
Cost of—Dungarvan, 40,941, 41,064; Kenmare, 41,856.
Prohibited—Dungarvan, 40,111–2.
Increase of—Dungarvan, 40,500–1, 40,530–3, 40,636–8, 40,772–7, 40,952–7, 41,091; Kinsale, 41,393; Kenmare, 42,399.
Decrease in — Bantry, 42,445, 42,531–3, 42,648; Dingle, 43,204–5.
Fish caught in, not equal to line fish—Dungarvan, 39,949–57, 40,089–91, 40,420–33.
Regulations with regard to—Dungarvan, 40,111–2, 40,171–6, 40,233–8, 40,373–9, 40,504–11, 40,640–3, 40,672–9, 40,984–6, 40,993–41,001, 41,112–21; Kinsale, 41,403–4, 41,451–3.
Mode of setting — Dungarvan, 40,330–3, 40,381–5, 40,502–3, 40,512–5, 40,810–3, 40,850–1, 40,958–75, 41,070, 41,096–7, 41,115–6; Kinsale, 41,308–10.
Owned by farmers—Kinsale, 41,244.
Not injurious — Dungarvan, 40,738–9, 40,743–53, 40,759–60, 40,792–4, 41,035, 41,052–9, 41,067, 41,070, 41,097–101, 41,124–6; Kenmare, 41,754–5, 42,056, 42,060; Bantry, 42,704–6, 42,881–4.
Beneficial effects of—Dungarvan, 40,559–63, 40,770–1, 41,036–8, 41,045–7, 41,066, 41,081–90, 41,169–71.
Kinds of fish caught by—Kenmare, 41,722, 41,736–37, 41,873–77, 41,963–64; Bantry, 42,433–38; Dingle, 43,009.
Seizure of—Kenmare, 41,846–8, 41,970, 42,219–20, 42,294, 42,338–43, 42,348–9; Bantry, 42,483–4, 42,553; Dingle, 43,026.
Injured by trawlers—Kenmare, 41,795–800, 41,822, 41,854–5, 41,965, 42,019–20, 42,401–2; Bantry, 42,493, 42,496, 42,547, 42,552, 42,698; Dingle, 43,278, 43,306, 43,533, 43,653, 43,700–3.
Season for using—Bantry, 42,513–5; Dingle, 43,282–3, 43,451–4.
Differences between trammel-net fishermen and trawlers—Kenmare, 42,208–10, 42,264, 42,289–93.

Trawl-nets (for herrings):—
Campbeltown, 33,993.

Trawl-nets (see also "Trawling"):—
Length of beam—Cullercoats, 375, 390–1; Sunderland, 3305–12, 3490–4; Staithes, 5158; Flamborough, 6743; Hull, 6873, 7014, 7019–22, 7457–9, 8011–8; Brixham, 8178–81, 8195–8, 8628–30, 8685–9, 8782–3; Torquay, 9582–5, 9600–6, 9690, 9821, 9898; Ramsgate, 10,088, 10,101–2, 10,104–6, 10,195, 10,203, 10,430, 10,492, 10,830, 10,834–9; Yarmouth, 11,211–3, 11,301–2, 11,409, 11,488–90, 11,620–4, 11,724–9, 11,812–9; Billingsgate, 12,412, 12,908, 13,171–2, 13,203–4, 13,273–6; Grimsby, 16,140, 16,143, 16,167–9, 16,172; Hastings, 16,849–50; Brighton, 17,802; Plymouth, 18,710–4, 18,720–3; Exeter, 19,379, 19,415; Campbeltown, 33,703–6; Kingstown, 35,494–5; Ringsend, 37,387–90; Wexford, 38,693; Kenmare, 41,763–4, 41,890–1; Galway, 45,005; Moville, 46,777; Carrickfergus, 47,677; Skerries, 49,659; Dumfries, 54,374–83; Fleetwood, 55,047–9, 55,127–9, 55,132–7, 55,258–62; Liverpool, 55,661, 55,716–8, 55,839, 55,896–7, 56,020–2, 56,211–9; Tenby, 56,682–3, 56,765–8; Swansea, 57,219; London, 58,941, 60,918–19, 61,076.
Head irons—Cullercoats, 376–80; Sunderland, 3314–5; Hull, 7030–4; Brixham, 8182–3, 8199, 8365, 8635–46, 864–9; Ramsgate, 10,450–4; Grimsby, 16,144–5; Plymouth, 18,942–4; Kenmare, 41,897–8; Fleetwood, 55,142–3, 55,271–6.
Size of Nets—Hull, 6874, 7372; Brixham, 8957; Yarmouth, 11,099, 11,408–9, 11,486–90; Hastings, 16,913–4, 17,034–5, 17,294, 17,316, 17,320–1, 17,324–9, 17,425–7; Ringsend, 37,566–7; Wexford, 38,578–82; Dungarvan, 40,152–61; Kenmare, 41,765–67; Skerries, 49,594–96; Dumfries, 53,986–8; Liverpool, 55,951; London, 61,075–8.
Broken away from beam when a heavy catch—Billingsgate, 13,219–21, 13,226, 13,242.
Mesh, size of—Sunderland, 3537–9; Hull, 7025–7, 7376, 8006–10; Brixham, 8128, 8591–3, 8596–8, 8604, 8609–15, 8627, 8776–81, 8916–20, 8931, 9010–12, 9340; Torquay, 9899–905; Ramsgate, 10,204–19; Yarmouth, 11,410; Billingsgate, 12,410–3, 13,169, 13,204; Grimsby, 14,147–50; Brighton, 17,556, 17,665, 17,766–72, 17,801, 17,962–5, 17,966, 17,971, 17,976, 18,006, 18,030; Plymouth, 18,729–35; Exeter, 19,438–41, 19,451–4, 19,520, 19,599, 19,683, 19,821; Ringsend, 37,391–2; Wexford, 38,486, 38,694; Kenmare, 41,765–7, 41,892–5; Moville, 46,879–80; Carrickfergus, 47,627–9; Skerries, 49,660–3; Dumfries, 54,047–58, 54,320–38, 54,502, 54,548–9, 54,564–6; Fleetwood, 55,144–51, 55,267–70; Liverpool, 55,596–614, 55,614–6, 55,805, 55,885–95, 55,952–60, 55,999, 56,020–2, 56,057–74, 56,116–23, 56,235–7; Tenby, 56,725–32, 56,817–9; Swansea, 57,220–2, 57,948–55; London, 58,800–10, 58,821, 58,851, 59,002–12, 61,078–9.
Ground rope—Sunderland, 3315*a*–21; Brixham, 8192–4, 9014–5, 9055–9; Yarmouth, 11,218–21; Kenmare, 41,896; Fleetwood, 55,277–80; Liverpool, 55,899–902, 56,211–9.
Regulations not enforced—Hull, 8011–8; Brixham, 8122–3, 8128, 8201, 8607–8, 8617–19, 8624; Ramsgate, 10,217–9; Yarmouth, 11,299.
Regulations required—Brighton, 17,977; Exeter, 19,441, 19,458–61, 19,533–4, 19,538–9, 19,545–6, 19,556, 19,950; Liverpool, 55,679–85, 55,885–95.
Regulations not required—Hull, 7196, 7371–4; Yarmouth, 11,301–2, 11,472–3; Liverpool, 56,123–4, 56,150–4, 56,199–200, 56,211–9.
Regulations of mesh injurious—London, 58,800–10, 58,821, 58,851, 58,995–7, 59,004–12, 59,019–22.
No inspection of—Hull, 7022; Ramsgate, 10,220, 10,465, 10,599–60; Tenby, 56,726.
Illegal—Torquay, 9484; Brighton, 17,589–90, 17,659–65, 18,030; Exeter, 19,438–9, 19,458.
Memorial respecting prohibition of in summer—Torcross, 18,366.
Manufacture of, suspended in consequence of the issue of this Commission—Brixham, 8588–90, 8592, 8605–6, 8616.
Ordered to be destroyed by Board of Trade—Brixham, 9186–96.
Destroyed — Howth, 36,488–9; Wexford, 38,906–8; Dunmore, 39,161.

Dutch Trawls:—
Brixham, 8358–61, 8754–6*a*.

Trim Nets:—
Lynn, 14,663, 14,688, 14,775–9, 14,873, 14,889, 14,891–2, 14,903.

Trim-tram-nets:—
Harwich, 20,533.

Trunk Nets:—
Flamborough, 6688–91, 6751–9, 6773–4, 6791–808.

Tuck Nets (see also "Seine Nets"):—
Brixham, 8861–3, 8889; Torcross, 18,150, 18,159–61, 18,166, 18,176–9, 18,181–6.
Destroy small fish—Torcross, 18,489.
Do not injure fish—Exeter, 19,800.
Ought to be prohibited—Torcross, 18,416, 18,422, 18,442.
Prohibition would be useless—Torcross, 18,370.
Mesh, size of—Torcross, 18,213–6, 18,208, 18,212, 18,344–7, 18,361, 18,428, 18,461–3, 18,465, 18,491–5.
Soles go through—Torcross, 18,218.

NETS (*continued*):—
Turbot Nets:—
Newbiggin, 1436–59; Sunderland, 2921–32, 3109–11; Hartlepool, 4096; Edinburgh, 26,687–9; Ballantrae, 53,820*a*.
Value of—Hartlepool, 4102, 4118.

ORKNEYS:—
Fishery increasing—Kirkwall, 31,380–3.

PILOTING:—
Privileges of—Dunmore, 39,526–34, 39,589–94, 39,670–3, 39,690–706, 39,722–3, 39,727–8.

POLE TRAWL:—
Dungarvan 41,136–7.

POLICE:—
Stornoway, 32,641–7; Tobermory, 33,476; Campbeltown, 33,822, 34,212–9, 34,227.
Property restored when recovered—Edinburgh, 26,291–4.

REGULATIONS (Irish Fisheries) (see also "Convention" and "Irish Fisheries"):—
Account of—Kenmare, 42,121–24, 42,183, 42,201, 42,218, 42,225, 42,228, 42,245, 42,248–49, 42,278, 42,280, 42,284, 42,350, 42,393; Bantry, 42,470, 42,473–74, 42,477–82, 42,485, 42,554–55, 42,653, 42,658–60, 42,690, 42,843–46; Dingle, 43,021–25, 43,059–67, 43,232, 43,504–06, 43,513–18, 43,529–30, 43,553, 43,612–18, 43,644–46, 43,690–91, 43,771; Westport, 43,886–99, 44,118–21, 44,187–200, 44,212–16, 44,237–38, 44,252–53, 44,335–36, 44,339–40, 44,357–62, 44,453–54; Galway, 45,229–40, 45,706, 45,867–69; Inver, 46,152–59, 46,368, 46,421–22; Moville, 46,752–55, 46,923–31, 46,950–53; Carrickfergus, 47,291–95, 47,417–24, 47,532–34, 47,700–02, 47,796–806; Carlingford, 48,259–60, 48,432–34, 48,487–90, 48,492–96; Dundalk, 48,574, 48,823–25.
Injurious effects of—Carrickfergus, 47,638–43, 47,735, 47,740, 48,060; Balbriggan, 49,792–94.
Observed—Carrickfergus, 47,406–08, 47,562; Dundalk, 48,578–83.
Not observed—Dingle, 43,274–75; Inver, 46,156–59, 46,219–22, 46,456–59; Carrickfergus, 47,807–11, 48,062–64; Carlingford, 48,500–01; Skerries, 49,321–24, 49,370–74, 49,519–23, 49,615–16, 49,626–28.
Not injurious—Bantry, 42,631.
Suggestions with regard to—Kenmare, 42,183, 42,194, 42,209, 42,237–41, 42,276, 42,281–5, 42,293; Bantry, 42,687–9, 42,693–5, 42,701–2, 42,715–23, 42,757–60, 42,771; Westport, 44,232–5, 44,313–17, 44,337–8; Inver, 46,218, 46,438; Carrickfergus, 48,064, 48,067–69; Carlingford, 48,444–5, 48,468–71, 48,481–85, 48,490–91; Skerries, 49,145, 49,152, 49,248–49, 49,564–66, 49,602.

SCOTCH FISHERIES:—
Account of, by Mr. Mackie from Peterhead to Wick—Wick, 30,830.

SEAWEED:—
London, 58,783, 58,796–7, 58,844–6, 58,891–7, 58,923.

SHELL FISH (see "Fish," various kinds of).

SHETLAND:—
Principal fisheries—Lerwick, 31,746.

SHOALS (see also "Herrings" and "Trawling for Herrings"):—
Course of—Wick, 30,496–8.
Diminution in size of—Wick, 31,109.
Effect of boats going amongst—Peterhead, 29,419.

SHORE POLICE:—
Employment of—Edinburgh, 26,288.

SPANISH TRADE:—
Abandonment of—Kirkwall, 31,282–6.

SPAWN (see also "Trawling," "Shell-fish—Oysters"):—
Appearance of—Cullercoats, 170–3, 369–74, 398–400, 1008; Sunderland, 3401–4, 3641–59, 3830–8; Hartlepool, 4253–6, 4435–7, 4599–601, 4659–64, 4738–45, 4878–83; Kenmare, 41,778–80.
Destroyed by herring-nets—Brixham, 9120.
Not destroyed by herring-nets—Edinburgh, 27,094–6.
Destroyed by seine-nets—Brighton, 17,520–4, 17,579–86, 17,818.
Vivification of—Edinburgh, 36,345–52.
Floating on water—Torquay, 9529–32, 9575–7, 9906–15.
Devoured by fish—Cullercoats, 403–7; North Sunderland, 1872–8; Holy Island, 2630–5; Sunderland, 3455–7, 3505–9, 3660, 3789–93, 3819–27; Filey, 6371; Hull, 6953, 7489–90, 7702, 7759–61; Yarmouth, 11,447–52; Billingsgate, 13,200–1; Grimsby, 15,924–5, 16,020–2, 16,041, 16,623; Edinburgh, 27,223–7; Dundalk, 49,009–10, 49,014.

SPAWNING:—
Spawning grounds—Kenmare, 42,046; Galway, 44,702–03, 44,796–97, 45,006, 45,031, 45,033, 45,280, 45,632, 45,808, 45,862, 45,887–88; Inver, 46,407–08; Moville, 46,934–36.
Cod and Ling:—
Spawning ground of—Hartlepool, 4438; Lerwick, 31,976; Dingle, 43,303; Westport, 43,924; Dundalk, 48,625.
Spawning time of—Hartlepool, 4438–40.
Cuttle-fish:—
Torquay, 9578-9, 9911.
Flat-fish:—
Spawning time of—Newbiggin, 1259.
Haddock:—
Spawning ground of—Cullercoats, 113, 456-8; Holy Island, 2476, 2483–4, 2616; Dundalk, 48,625.
Spawning time of—Cullercoats, 268; Newbiggin, 1257–8; Holy Island, 2479–82, 2614–5; Hartlepool, 4438–40; Dingle, 43,303.
Herrings:—
Spawning ground of—Cullercoats, 459-66, 527, 548–57, 648; Newbiggin, 1372–9; Sunderland, 3822; Yarmouth, 12,220–1, 12,253–4; Grimsby, 16,039; Plymouth, 18,611, 18,812, 18,880, 19,278; Wick, 30,192, 30,525; Carlingford, 48,389–90; Ardrishaig, 51,750; Tarbert, 53,209–14; Ballantrae, 53,820*a*.
Spawning time of—Holy Island, 2631–4; Hartlepool, 4440–3; Staithes, 5247–8; Torquay, 9481, 9948; Ramsgate, 11,044–6; Lynn, 14,650; Boston, 15,535–7, 15,540; Hastings, 16,942–3; Dunbar, 27,383–9; Wick, 31,113–5, 31,118–9; Kirkwall, 31,251–3, 31,676; Arklow, 37,983; Kenmare, 42,085–7; Dingle, 43,155; Inver, 46,403–8; Moville, 47,099; Carrickfergus, 47,824–5; Carlingford, 48,388; Skerries, 49,194–7, 49,573; Ardrishaig, 51,161–70, 51,293–322, 51,729–34, 51,749–51; Inverary, 52,527–38.
Mackerel:—
Spawning time of—Torquay, 10,050–5; Ramsgate, 11,055–6; Wyke Regis, 20,256.
Oysters (see "Shell Fish").
Plaice:—
Spawning time of—Torcross, 18,470.
Soles:—
Spawning grounds of—Cullercoats, 529–33; Sunderland, 2787; Ringsend, 37,547–50.
Spawning time of—Newbiggin, 1259.
Sprats:—
Spawning time of—Torquay, 10,029; Ramsgate, 11,047–8.
Spawning ground of—Exeter, 19,725.
Turbot:—
Spawning grounds of—Hartlepool, 4139.
Spawning time of—Newbiggin, 1260; Sunderland, 3036–7; Hartlepool, 4433–4.
White-fish:—
Spawning grounds of—North Sunderland, 1888–92, 1980–2.

STATISTICS:—
Difficulty of collecting—Edinburgh, 27,234–46, 27,562–602.
Of boats, men, and fish—Eyemouth, 28,224; Peterhead, 29,326–7; Cromarty, 30,118–21; Wick, 30,162; Kirkwall, 31,544; Ballantrae, 53,820*a*; Fleetwood, 55,466.
Of cured and fresh herrings—Eyemouth, 27,785–90; Anstruther, 28,481; Wick, 30,169, 30,411–2; Kirkwall, 31,500, 31,548.
Of cured cod and ling in the Orkneys—Kirkwall, 31,547.
Of branded fish—Wick, 30,847.
Of Faroe fishery—Lerwick, 32,172–7.
Of white fish inaccurate—Wick, 30,944.
Of herrings—Wick, 31,134.

ST. IVES LOCAL ACT:—
St. Ives, 24,754, 24,969–70, 24,979–90.

TEES CONSERVANCY COMMISSIONERS:—
Hartlepool, 4164–76, 4266–79, 5005–22.

THAMES CONSERVANCY:—
Jurisdiction of—London, 61,044–50, 61,080–1, 61,102–5, 61,132, 61,135, 61,139–63, 61,218–9, 61,228, 61,276–85.

TRADE MARKS (see also "Branding"):—
Stornoway, 32,433–7; Greenock, 50,535–7, 50,945–8.

Trawling (Beam) (see also "Trawlers" and "Injury done to Nets by," &c.):—
Kinds of fish caught by—Cullercoats, 217, 870–3; Sunderland, 3239, 3257–9, 3279, 3598; Hartlepool, 4534; Hull, 6893, 6948, 7067–8, 7075–6, 7100–2, 7146, 7177–81, 7462, 7867; Plymouth, 18,643, 18,758; Edinburgh, 26,639; Kingstown, 35,508–15; Howth, 36,908–16; Ringsend, 37,397–400; Dungarvan, 40,754–5; Kenmare, 41,770, 41,934–37, 42,137; Bantry, 42,643; Galway, 44,582–86, 45,324, 45,960–71; Inver, 46,172; Moville, 46,638–39, 46,741–43, 46,994; Carrickfergus, 47,570–1, 47,651–7, 47,989; Skerries, 49,282, 49,392, 49,671–2; Fleetwood, 55,179; Liverpool, 55,581–2; Swansea, 57,322.
Increase of take by—Hastings. 17,154–6, 17,186; Kenmare, 41,945–6, 41,981, 42,256; Bantry, 42,567, 42,572–3, 42,626–44; Dingle, 43,341–4, 43,559; Galway, 45,973; Carrickfergus, 47,306, 47,674.
Decrease of take by—Harwich, 20,566–81; Kingstown, 35,427, 35,500, 35,508, 35,516–22, 35,543–53; Wexford, 38,472–6, 38,704–8, 38,718–23, 38,832–6; Kenmare, 41,943, 42,038, 42,049, 42,061, 42,073, 42,136, 42,152–54, 42,388–91; Dingle, 43,269–73, 43,295, 43,298–300; Galway, 44,498, 44,503–05, 44,990–91, 45,476, 45,729, 45,805; Moville, 46,881–84; Carrickfergus, 47,623; Skerries, 49,394; Swansea, 57,226–7, 57,235–46, 57,599.
Injurious effects of—Cullercoats, 113, 285–8, 420, 657–62, 732–43; Newbiggin, 1340–1; North Sunderland, 1731–9, 1932–3; Sunderland, 2856–7, 3130–2, 3138–9, 3846–7, 4001; Hartlepool, 4192–200, 4258–61, 4324–30; Filey, 5688, 5964, 6173–5, 6206; Flamborough, 6440, 6559–61, 6746, 6778, 6827, 6843; Torquay, 9473–8, 9482, 9533–5, 9550, 9744, 9748, 9945, 9947; Ramsgate, 10,241–2, 10,989; Torcross, 18,199, 18,402–5, 18,409, 18,425, 18,503–5, 18,590; Polperro, 21,762, 21,773–83; Penzance, 24,331; Edinburgh, 26,341–4, 26,560, 26,626–9, 26,642, 26,974–80, 26,833–5, 27,061–68; Dunbar, 27,262, 27,281–4, 27,328, 27,342–3, 27,405–7, 27,444–54, 27,458–9; Eyemouth, 27,909; Anstruther, 28,488–98, 28,520–4; Broughty Ferry, 28,712–25; Kingstown, 35,676, 35,716–20, 35,756–8, 35,826–8, 35,890, 35,963, 36,029, 36,243, 36,391, 36,564–9, 36,898, 36,933–9; Wexford, 38,551–2, 38,732–7; Dunmore, 39,154, 39,183–210, 39,312–21, 39,370–89, 39,413–4, 39,475, 39,570–8, 39,625–7, 39,660–2, 39,756–60, 39,764–70; Dungarvan, 40,139–44, 40,147–50, 40,201–2, 40,253–5, 40,262–5, 40,304–6, 40,356–70, 40,684–700, 41,140–5; Kinsale, 41,492–8, 41,477; Kenmare, 41,756–7, 41,787–9, 41,820–2, 42,024–6, 42,062, 42,106, 42,110; Bantry, 42,517, 42,832, 42,885–7, 42,938; Dingle, 43,557, 43,620, 43,635, 43,653–4, 43,671, 43,692–5; Galway, 44,490–5, 44,602–6, 44,804–13, 44,861–9, 45,010, 45,087–94, 45,215–9, 45,629, 45,712, 45,736, 45,749–93; Inver, 46,175–6; Dundalk, 48,529, 49,024–31, 49,044–8; Skerries, 49,115–27, 49,143, 49,237–9, 49,554–7, 49,634–45; Liverpool, 55,675–6; Tenby, 56,786–90.
Small fish and spawn caught and destroyed by—Cullercoats, 240–8, 251–2, 258–73, 369–74, 395–401, 412–14, 676–9, 846–55, 935–7, 1008; Newbiggin, 1340–1, 1645–9, 1693–7; Sunderland, 3063–7, 3073–6, 3132–7, 3248–54, 3443–5, 3575–95, 3641–712, 3754–6, 4001–5; Hartlepool, 4129, 4549, 4555–9, 4644–8, 4967; Staithes, 5078–9, 5307, 5471–2, 5485–6; Filey, 5676, 5687–8, 5743, 5896, 5964, 6013, 6023–5, 6043; Flamborough, 6450, 6551, 6844; Hull, 6959–62, 6971–3, 6981, 6991–2, 7138, 7142, 7362–4, 7377–9, 7493, 7587, 7660; Brixham, 8090–7, 8100–12, 8272, 8394–5, 8495–6, 8706, 8715–8, 8840–2, 8874–5, 8908–13, 8922–8, 9014–15, 9035–42, 9278; Torquay, 9474–9, 9482, 9511–28, 9533–5, 9693–7, 9800–5, 9825–39, 9854–8, 9906, 9950–2, 9984–6; Ramsgate, 10,123–30, 10,297–302, 10,399, 10,721, 10,743–7; Torcross, 18,199, 18,221, 18,230, 18,315–6, 18,337, 18,425, 18,436–8, 18,468, 18,595; Plymouth, 18,611, 18,660–4, 18,808–11, 18,853, 18,882–3, 18,982, 19,025, 19,177–8, 19,268, 19,272, 19,282–3, 19,289–91, 19,297–8; Exeter, 19,425–7; Harwich, 20,552–81; Mevagissey, 22,305, 22,957–60, 22,988–91; Penzance, 24,332, 24,424–30, 24,448–59; Edinburgh, 26,342–53, 26,652, 26,835, 26,978, 27,228–33; Dunbar, 27,284–90; Anstruther, 28,500–19; Campbeltown, 33,711, 33,798; Peel, 34,678, 34,682–5; Kingstown, 35,558–65, 35,567–8, 35,681–3, 35,762–70, 35,803; Howth, 36,032–4, 36,245–6, 36,371–4, 36,424–35, 36,446–57, 36,547–51, 36,573, 36,589; Ringsend, 37,482, 37,678–83, 37,836–41; Wexford, 38,552, 38,563–6, 38,709–17, 38,990; Dunmore, 39,106–16, 39,475, 39,555–62, 39,620–2, 39,642–51; Dungarvan, 40,245–52, 40,364–70, 40,453–6, 41,143; Kenmare, 41,770–3, 41,947, 42,043–5,
Trawling (Beam) (*continued*):—
42,074–7, 42,089, 42,100–3; Bantry, 42,596–601; Dingle, 43,163–4, 43,167–72, 43,224–30, 43,534, 43,537, 43,625–32, 43,694, 43,764; Galway, 44,478–89, 44,507, 44,541–3, 44,587–601, 44,667–70, 44,675–84, 44,696–701, 44,704–6, 44,745–60, 44,798–9, 44,820–5, 44,837–47, 44,860–1, 44,976–89, 45,001–2, 45,030, 45,206–13, 45,264–6, 45,336–41, 45,369, 45,398–410, 45,623–7, 45,663, 45,700–1, 45,724, 45,750–4, 45,809–11, 45,815–6, 45,863–5, 46,044–7; Moville, 46,767–74; Carrickfergus, 47,297–305, 47,308–11, 47,394–402, 47,484, 47,504–12, 47,599–600, 47,611–2, 47,624–33, 47,958–64, 48,049; Dundalk, 48,608–10, 48,623, 48,752–65, 48,812–3, 49,009, 49,015–18; Skerries, 49,207–12, 49,290–2, 49,358, 49,554–62, 49,673–9, 49,684–6; Balbriggan, 49,804–15; Liverpool, 55,806–9, 55,820–30, 56,085–90, 56,107, 56,167–8, 56,238–46; Tenby, 56,838–43.
Spawn and small fish not destroyed by trawling—Cullercoats, 896; Sunderland, 3246–7, 3399–404, 3440–1, 3509–10, 3694–7, 3764–6; Hartlepool, 4135, 4859–62, 4884, 4922; Hull, 6992–4, 7136–7, 7190–3, 7359, 7446, 7489–90, 7700, 7841; Ramsgate, 10,305; Yarmouth, 11,276–81, 11,389–95, 11,665, 11,849; Billingsgate, 13,200, 13,202; Plymouth, 18,780–4, 18,812, 18,982, 19,119–21; Falmouth, 23,640; Kingstown, 35,567–9; Howth, 36,499–502; Wexford, 38,482–4, 38,555–62; Bantry, 42,599–600; Dingle, 43,169, 43,173, 43,371, 43,778; Liverpool, 56,099–106, 56,111; Tenby, 56,733, 56,843–4; London, 60,796.
Fish injured by — Sunderland, 3458–64, 3584–7, 3603–6, 3621, 3714–22, 3807; Hartlepool, 4543–52, 4574–7, 4641–3, 4853–8, 4919; Staithes, 5260–4, 5469–77, 5503, 5558–9, 5627; Filey, 5677, 5900–2, 5978–9, 6016–22, 6027, 6047–8, 6209–18, 6242, 6244, 6309, 6361–5, 6384–91, 6396, 6401–9; Flamborough, 6553; Hull, 6884, 6955–6, 6958, 7360, 7491–2, 7584, 7701; Billingsgate, 12,728–31, 13,197–9; Boston, 15,218–9; Torcross, 18,219; Polperro, 21,761–2; Dunbar, 27,403–4; Galway, 44,488, 44,779–80, 45,028, 45,584, 45,652.
Fish not injured by—Hartlepool, 4716–9; Hull, 7141; Yarmouth, 11,225, 11,297–8, 11,388, 11,664; Billingsgate, 12,499, 13,199; Grimsby, 16,154; Plymouth, 19,148–51; Dungarvan, 41,128; Dingle, 43,310–4, 43,362–9.
Fish frightened by — Galway, 44,544, 44,662, 44,862, 45,047–50, 45,385, 45,720, 45,879 83; Skerries, 49,140.
Fish not frightened by—Bantry, 42,742; Dingle, 43,176–82, 43,765.
Injury to drift-net fishing by—Newbiggin, 1478–86, 1541–3; Sunderland, 2771–5, 2863; Hartlepool, 4078–118; Filey, 6168*a*; Brixham, 8788–95; Torquay, 9448–55, 9631, 9641–5, 9737, 9946; Lowestoft, 14,115–8; Torcross, 18,271–3, 18,278, 18,281, 18,447; Plymouth, 18,743–4, 18,870–1; Polperro, 21,507, 21,597–606, 21,731, 21,737, 21,848, 21,851; Dunbar, 27,516, 27,695; Eyemouth, 28,189–98; Peel, 34,667–79; Howth, 36,059–61, 36,169–79, 36,211–25, 36,240, 36,378–82, 36,458–61, 36,868; Ringsend, 37,486–91, 37,692–9, 37,798–804; Wexford, 38,781–3; London, 61,019–23.
Injury to lobster and crab pots—Torquay, 9456–7, 9546; Torcross, 18,258, 18,264, 18,266, 18,538–49, 18,551–3, 18,592–3; Falmouth, 23,640.
Injury to oysters—Torquay, 9670–2; Wexford, 38,878–9.
Injury by, denied—Yarmouth, 11,292, 11,530–1, 11,762–7; Howth, 36,498, 36,503–8; Wexford, 38,552–4; Moville, 46,740, 46,744.
Injury to long-line fishing—Cullercoats, 133–41, 185–92, 684–8, 874–5; Newbiggin, 1147–51, 1231–3, 1292–5, 1516–8; Sunderland, 2863–6, 3340–50, 3375–9, 3485, 3972–5, 4008–11; Hartlepool, 4569–71, 4865–6; Staithes, 5042, 5083, 5375–7; Filey, 5967–71, 6154–60, 6303–8; Flamborough, 6445, 6520–1, 6577, 6622, 6668–9, 6776*a*, 6782–3, 6824, 6828, 6831; Brixham, 8290–2; Torquay, 9698; Torcross, 18,602–6; Plymouth, 18,617; Polperro, 21,376–7, 21,799; Dunbar, 27,333–4, 27,342; Eyemouth, 27,960–2, 28,070–1; Broughty Ferry, 28,829–36; Campbeltown, 33,710; Peel, 34,761; Kingstown, 35,574–600, 35,696–710, 35,771–5, 35,801, 35,837–57, 35,882–5, 35,936–42; Howth, 36,435–8, 36,552–6, 36,574–9, 36,656–69; Ringsend, 37,684–9, 37,790–7; Kenmare, 42,022, 42,027; Dingle, 43,531, 43,569–81, 43,684–9; Galway, 45,217, 45,495, 45,997–9, 46,227–8; Carrickfergus, 47,687, 47,764, 47,986–8; Dundalk, 48,533, 48,724–8, 48,747–51, 48,817, 48,943, 49,010, 49,455–61, 49,507–8; Greenock, 50,677, 50,694–5, 50,719, 50,723;

Trawling (Beam) (*continued*):—
Tenby, 56,786–90, 56,845–9, 56,958–68, 57,055–65, 57,067–74, 57,096–9, 57,113–6.
Long-line fishing not injured by—Newbiggin, 1487–8; Sunderland, 3267–71, 3397–8, 3488; Hartlepool, 4863–73, 4938–9; Hull, 6997–8, 7048, 7174–6, 7308–9, 7466, 7774; Brixham, 9150; Billingsgate, 12,491, 12,721; Grimsby, 15,957–71, 16,406–10, 16,562–3, 16,596–7; Hastings, 16,878, 16,981–2, 17,184; Plymouth, 18,996; Kingstown, 35,592–9; Howth, 36,498; Dungarvan, 41,127; Kenmare, 41,816–8; Moville, 47,049–53; Carrickfergus, 47,850–67; Fleetwood, 55,208–16.
Beneficial effect of—Sunderland, 3452–3, 3905–6, 4847; Hull, 7064, 7304, 7739, 7763, 7887; Brixham, 8101; Ramsgate, 10,373, 10,532, 10,748; Yarmouth, 11,582; Billingsgate, 12,415, 12,441; Plymouth, 18,817; Tenby, 56,866–7.
Continuous on same ground not injurious—Hull, 7060–6; Brixham, 8427–30; Torquay, 9548–9, 9555–64; Ramsgate, 10,509–13; Hastings, 17,058–63; Kingstown, 35,531–38; Kenmare, 42,256–7; Bantry, 42,569, 42,595.
Profitable—Filey, 6376; Hull, 7334–5, 7431, 7443, 7469, 7482–6, 7588–9, 7683, 7794–5, 7809–10, 7871, 7873, 7954; Brixham, 8393, 8773, 8812, 8822, 8829–33, 8896–7, 8998, 9004, 9081–8, 9364–73, 9386–7; Grimsby, 16,134–8, 16,443–6, 16,666–9; Plymouth, 19,112; Dingle, 43,096, 43,102, 43,111–13, 43,201; Galway, 44,807, 45,901, 45,924, 45,928, 45,951, 46,063, 46,069, 46,096; Skerries, 49,285–86, 49,695; London, 60,782, 60,922–5, 60,949.
Not profitable—Hull, 7236, 7242; Brixham, 8692, 8774, 9105; Torquay, 9479; Ramsgate, 10,256–8, 10,404–8; Plymouth, 18,823–6, 18,838–41; Dunmore, 39,131, 39,503–4,; Galway, 44,998–9, 45,011, 45,318, 45,697, 45,731; Carrickfergus, 47,477–83, 48,002–4; Skerries, 49,161; Liverpool, 55,978.
If prohibited, fish would become scarce—Hull, 7072–4; Torquay, 9553, 9746–7; Billingsgate, 12,638–46; Ringsend, 37,588; Dungarvan, 41,169–71.
If prohibited, drift-boats would have a monopoly—Hull, 7724.
Small fish, sale of—Sunderland, 3951–7, 3995–4000; Hartlepool, 4553, 4760–2, 4917, 4958–64, 7142; Kingstown, 35,565; Tenby, 56,735–40.
Quantity of fish caught by—Cullercoats, 249–50, 296–301, 402, 748–50; Newbiggin, 1620–1; Sunderland, 3243–4, 3253, 3447, 3548, 3581–2, 3772–6, 3799–801; Hartlepool, 4536, 4777–89; Yarmouth, 11,110–12, 11,114, 11,369–72, 11,483, 11,755, 12,280–1; Plymouth, 18,652, 18,888, 18,892, 19,013; Kingstown, 35,500–57; Ringsend, 37,445–7, 37,674–7, 37,842–3; Kenmare, 41,960; Dingle, 43,159–60; Galway, 44,524; Moville, 46,783–5; Carrickfergus, 47,665, 51,115–47; Liverpool, 55,948; Tenby, 56,698, 56,744–51.
Steam trawling—Dunbar, 27,272, 27,314–16; Dunmore, 39,175–210, 39,372–89, 39,412–4, 39,475, 39,547, 39,573–4, 39,764–70, 39,811–2, 39,816–9, 39,838–78, 39,886–7, 39,904.
Inshore trawling, its effects—Cullercoats, 856–9, 1023; Sunderland, 2780–1, 2860–1; Hartlepool, 4928–31; Staithes, 5081; Filey, 6201–3; Flamborough, 6571, 6671; Torquay, 9473, 9550, 9744, 9748, 9945, 9947, 9985–6; Ramsgate, 10,124–7; Brighton, 17,666, 17,972–5, 17,979; Torcross, 18,210, 18,261–6, 18,311–6, 18,444–7; Plymouth, 18,615–7, 18,627, 18,633–5, 18,804–7, 18,903, 18,949; Harwich, 20,543–6; Polperro, 21,801–5, 21,956–63; Edinburgh, 26,628–55, 27,269, 27,600; Campbeltown, 33,712–7; Kingstown, 35,436–7, 35,439, 35,636, 35,640–2, 35,804–10, 35,891–5, 35,911–3, 35,918–31; Howth, 36,404, 36,497, 36,949–55; Dublin, 37,106–38; Wexford, 38,919; Dunmore, 39,169–74, 39,491–8, 39,618, 39,623–4, 39,652–9; Dungarvan, 39,969–71; Galway, 45,185–91, 45,242–8, 46,003–5, 46,048–51; Carrickfergus, 47,307, 47,733–37, 47,742, 48,034–35; Skerries, 49,122–5, 49,481–5, 49,524–6, 49,668–70, 49,687–89; Balbriggan, 49,719–21, 49.748–51.
First commenced—Cullercoats, 153–69; Newbiggin, 1342–7; Sunderland, 3068–72, 3880; Hartlepool, 4488–9; Kingstown, 35,411–4, 35,477–9; Howth, 36,008; Dunmore, 39,075–9.
Close season for—Dublin, 37,138–43; Ringsend, 37,439–40, 43,236; Dingle, 43,259–63, 43,779–83, 43,808; Galway, 46,115–6; Moville, 46,759–63, 46,912, 46,923–32, 47,167; Carrickfergus, 47,322–26, 47,584–90, 47,613–7; Liverpool, 55,594, 56,091–3.
Absence of—North Sunderland, 1930–4, 2322–3; Holy Island, 2471–5; Edinburgh, 26,629–32; Eyemouth, 27,911–4, 28,064–9; Anstruther, 28,368–71, 28,387–91; Stonehaven, 28,910–1, 29,081; Peterhead, 29,527–31, 29,760–1; Cromarty, 29,929; Wick, 30,189–90, 30,311–13, 30,474, 30,584–6; Kirkwall, 31,339; Lerwick, 31,810–1, 31,895; Arklow, 38,099.
Increase of—Cullercoats, 282, 494, 1018–9; Sunderland, 3283–4, 3777–8, 3784–5, 3976–90; Hastings, 17,251–2; Brighton, 17,880–2; Torcross, 18,180; Plymouth, 18,611, 19,200; Kingstown, 35,504, 35,607–8; Wexford, 38,724–6; Dunmore, 39,309–12, 39,520–2, 39,678–9.
Decrease of—Cullercoats, 495–6; Brighton, 17,669, 17,676–7, 17,761; Harwich, 20,531–3, 20,566–94; Dunbar, 27,265, 27,324–7; Wexford, 38,838–9; Dunmore, 39,675–6.
Not allowed with drift nets—Hull, 7044, 7400, 7402, 7409–10.
Instrument used in, for cutting drift nets—Lowestoft, 13,926–39, 14,126–31, 14,198–200.
Dead bodies brought up by—Hartlepool, 4512–6, 4892–7, 4936–7; Hull, 7712–4; Plymouth, 19,245–6.
Dead bodies not brought up by—Hull, 7464.
Sand taken up by—Sunderland, 3510–5, 3602.
Stones taken up by—Sunderland, 3412–4, 3419–26, 3602; Yarmouth, 11,891.
Hookers employed in trawling—Wexford, 39,081–3; Bantry, 42,563–6.
Best depth for—Yarmouth, 11,429–31; Grimsby, 16,112–3; Hastings, 16,868–70; Plymouth, 18,878–9; Harwich, 20,592–4, 20,635–40; Ringsend, 37,473; Kenmare, 42,386; Dingle, 43,357–8; Inver, 46,224; Skerries, 49,363–6, 49,453, 49,657–64; Balbriggan, 49,722–3.
Byelaws restricting—Kingstown, 35,439; Howth, 36,226–9; Dublin, 37,257–64; Ringsend, 37,472, 37,501; Wexford, 38,745, 38,894–910, 38,914–16; Dunmore, 39,141–51, 39,159, 39,327, 39,410–2.
Effect of prohibition—Dublin, 37,265–71, 37,623; Liverpool, 55,744–6, 56,208–9.
Interfered with—Cullercoats, 193, 305–6, 340, 410; Newbiggin, 1160, 1515; Hartlepool, 4262–3; Hull, 7096, 7517–26, 7684–90, 7805–7, 7887, 8002.
Regulation of, necessary—Cullercoats, 418–20, 927–34; Newbiggin, 1538–40; Sunderland, 2895, 2973, 3516–22; Hartlepool, 4336–7, 4612–8; Staithes, 5153, 5259, 5320–1, 5349; Filey, 6280–2, 6299; Brixham, 8130–5, 8204–8, 8288–9, 8413–22, 8660–5, 8723–6, 8735–7, 8845–52, 8914–5, 8931–4, 9175–84, 9239–40; Torquay, 9882–6, 9945–50; Ramsgate, 10,243–51, 10,318–31, 10,375–7, 10,576, 10,739–42, 10,990; Hastings, 16,886–92, 17,158, 17,235, 17,398–400, 17,416–22; Torcross, 18,513–5; Plymouth, 18,611, 19,032, 19,102, 19,182–4, 19,273–7, 19,954; Harwich, 20,976; Polperro, 21,458–62, 21,608–23; Penzance, 24,461–8; Kingstown, 35,943–5, 35,960–2; Howth, 36,212–25, 36,410–15; Dublin, 37,154–7; Wexford, 38,990, 39,328, 39,492–8; Liverpool, 56,091–3, 56,208–9.
A nursery for seamen—Hull, 7002–3, 7506–8, 7617; Billingsgate, 12,894–902.
Carried on all the year—Hull, 6976–9; Kenmare, 42,078–80.
Not carried on all the year—Kenmare, 41,921–6, 42,082–4; Bantry, 42.674–78, 42,766, 42,912–19; Dingle, 43,115–16, 43,235, 43,560; Galway, 46,014; Moville, 46,750–51, 46,756–58, 46,866; Dundalk, 48,742–43, 48,766; Skerries, 49,476, 49,665–67; Balbriggan, 49,754, 49,868–70.
Effect of eating fish caught by—Sunderland, 4027–34; Hartlepool, 4517–24, 4593–8, 4651–8, 4753–9, 4887–92, 4956–7.
Gall bladders burst by—Sunderland, 3632–40; Hartlepool, 4952–5; Staithes, 5261–4.
Gall bladders not burst by—Hull, 6964, 7365–6; Plymouth, 18,773–5.
Complaints of fishermen against—Filey, 5676, 5687; Lowestoft, 13,918–9, 13,922, 13,944–7, 14,202–3, 14,205–6; Kingstown, 35,439; Kenmare, 42,406.
Memorial against—Kenmare, 42,223–31; Galway, 45,075–86.
Protection against insufficient—Staithes, 5403–5, 5410; Ramsgate, 10,236–8.
Regulations in respect of, not enforced—Hull, 7044, 7453, 7526, 7719; Ramsgate, 10 236–8; Falmouth, 23,340–1.
Regulations in respect of, not required—Yarmouth, 11,473; Billingsgate, 13,171, 13,203–4; Ringsend, 37,723–32, 37,844–51; Moville, 46,929–31.
Regulations in respect of, if enforced, would be a hardship—Hull, 7047, 7409, 7723; Dundalk, 48,515–21, 48,622, 48,796–801; Skerries, 49,116, 49,367.
Fleets engaged in—Billingsgate, 12,924–7, 13,263–7.
How commanded—Billingsgate, 12,926–7, 13,263–4 13,277–9.

Trawling (Beam) (*continued*):—
Competition of, with line-fishing—Cullercoats, 210–15, 421–3; North Sunderland, 2036–7; Sunderland, 2954–8, 2964, 3325–8, 3415–6, 3465–9, 3809–10, 3860–2, 3915–21, 4006; Hartlepool, 4332–3, 4503–8, 4568, 4619–27, 4704–8, 4729–37, 4746–54, 4884–6, 4944–51; Hull, 7944; Yarmouth, 11,274–5, 11,895–8.
Advantageous to line-fishing—Grimsby, 16,293–6.
Not injured by line-fishing—Billingsgate, 12,825.
Inferior to line-fishing—Dungarvan, 40,551–4.
Line-fishing more profitable than—Yarmouth, 11,795–6; Grimsby, 16,429, 16,433; Skerries, 49,405–6.
Line-fishing less profitable than—Carrickfergus, 47,682–5.
Cannot go on with line-fishing—Staithes, 5254; Filey, 6300–2.
Carried on with line-fishing—Hull, 7769–73; Torquay, 9630, 9840, 9846.

Trawling for Flukes and Flounders:—
Greenock, 50,719, 50,723; Dumfries, 53,900–2, 54,312–4, 54,417–22; Morecambe, 54,571, 54,617–9, 54,745; Whitstable, 58,698.
Successful—Dumfries, 54,481–93.

Trawling for Herrings (see also "Seine Fishing"):—
Prohibited—Edinburgh, 26,192–7, 26,452; Greenock, 49,962–5; Ardrishaig, 52,054–67.
Effect of prohibition—Campbeltown, 33,675–83, 33,738, 33,780, 33,837–9, 33,882–3; Greenock, 50,422–4, 50,492–3, 50,590–5, 50,653*a*, 50,746–50, 50,766–83, 50,912–6; Ardrishaig, 51,178–9. 51,537–54, 51,984–8; Inverary, 52,309–14, 52,404–5; Tarbert, 53,063, 53,351–9, 53,499–7, 53,611–7, 53,726–8; Ballantrae, 53,820*a*.
Breach of prohibition—Ardrishaig, 52,217–22.
Complaints against—Tobermory, 33,587; Campbeltown, 33,767–70; Greenock, 50,604–8, 50,955; Ardrishaig, 51,385–9; Inverary, 52,612–811.
Effect of in glutting the market—Greenock, 50,066–7, 50,904–7.
Opinion of curers as to—Greenock, 49,971–3, 50,101–2; Ardrishaig, 51,860.
Destroys spawn and young fish—Campbeltown, 33,798; Peel, 34,974; Greenock, 50,078–86, 50,417, 50,619, 50,704–5, 50,732–8, 50,806–8, 50,817–8; Ardrishaig, 51,253–73, 51,571, 51,752; Inverary, 52,361–70, 52,614–28, 52,651–8, 52,821–30, 52,885–900, 52,910–15; Tarbert, 53,255–65; Ballantrae, 53,820*a*.
Does not destroy spawn and young fish—Greenock, 49,929–31; Ardrishaig, 51,415–7; Tarbert, 53,280–1, 53,531–4.
Injurious effects of—Dunbar, 27,540–5; Campbeltown, 33,854, 33,940–3, 33,965–8, 34,021, 34,054–81, 34,073, 34,114–21, 34,251–9; Greenock, 49,899–907, 50,278–95, 50,385, 50,449–59, 50,590–5, 50,642–7, 50,739–41, 50,784–8, 50,794–803, 50,806–8, 50,817–8, 50,834–44, 50,885–90, 50,899–900; Ardrishaig, 51,123–39, 51,514–30. 51,555–63; Inverary, 52,308–16, 52,318–44, 52,398–400, 52,410–15, 52,594–611, 52,629, 52,724–26, 52,821–40, 52,904; Tarbert, 53,781–4; Ballantrae, 53,820*a*.
Not injurious—Ardrishaig, 51,624–33.
Quality and condition of trawled herrings—Greenock, 49,935–53, 50,233–46, 50,296–314, 50,376–81, 50,498, 50,658–60, 50,821–33, 50,901–32; Ardrishaig, 51,126, 51,634–9, 51,673, 51,679–708, 51,860, 51,878; Inverary, 52,339–40, 52,872–8; Tarbert, 53,066–190, 53,282–9, 53,569–84, 53,777–81.
Injurious to white fishing—Greenock, 50,681–7; Inverary, 52,284–8.
Large takes of fish by—Ardrishaig, 51,624–33, 51,675–7; Inverary, 52,781–5, 52,834–40, 52,865–71; Tarbert, 53,291–304, 53,624–48.
Advantages of—Campbeltown, 33,686, 33,981, 34,005; Greenock, 49,967–70, 50,484–8, 50,509; Ardrishaig, 51,609–17, 51,853–6; Inverary, 52,704–5, 52,943–8; Tarbert, 53,180–90, 53,307–15, 53,320–33, 53,360, 53,386–98, 53,518–31, 53,722–5, 53,802.
Advantage of carrying both trawl and drift nets—Ardrishaig, 51,667–9, 51,800–1; Tarbert, 53,195–203.

Trawling for Herrings (*continued*):—
Profitable—Greenock, 49,923–4; Ardrishaig, 51,249–50; Tarbert, 53,320–33, 53,360, 53,386–93, 53,722.
Carried on inshore—Campbeltown, 34,089; Inverary, 52,734–42; Tarbert, 53,512.
In deep water exceptional—Tarbert, 53,568.
Absence of—Kirkwall, 31,420.
Fish injured and destroyed by—Ardrishaig, 51,205–13, 51,216–58, 51,323–35, 51,494–513, 51,555–64, 51,571–3, 51,785–7; Inverary, 52,318–30, 52,675–92; Tarbert, 53,452–5, 53,624.
Injurious to drift-net fishing—Greenock, 50,216, 50,503, 50,649–52, 50,804; Ardrishaig, 51,051–67, 51,075–87, 51,189–204, 51,365–75, 51,390–400, 51,514–30; Inverary, 52,569–81, 52,583–93, 52,706–17, 52,936.
Not injurious to drift-net fishing—Ardrishaig, 51,861–4; Tarbert, 53,798–9.
Difficulty of carrying out police regulations in regard to —Ardrishaig, 52,146–63, 52,172–9.
No objection to regulation of—Ardrishaig, 51,800–2, 51,865, 51,874–7, 51,992–4.
Commencement of—Inverary, 52,293–307.
Inferior mode of fishing to drift-net fishing—Inverary, 52,442–4.
Price of trawled herrings—Greenock, 50,087–91, 50,161–74, 50,191, 50,297; Ardrishaig, 51,673, 51,679–708; Tarbert, 53,066–190, 53,299, 53,569–84, 53,644.
Ought to be stopped—Campbeltown, 33,948, 34,095, 34,250; Peel, 34,976.
Seizure of nets—Ardrishaig, 52,140–2.
Improvement in mode of, impossible—Greenock, 50,789.
Demoralization of fishermen engaged in—Greenock, 50,093.
Decrease of fish not ascribed to—Greenock, 49,966.

Trawling for Shrimps:—
Dumfries, 53,979–82, 54,225; Morecambe, 54,571–86; Liverpool, 55,665–7, 55,870, 55,940–1, 56,051–2, 56,181–4, 56,191–2, 56,249.
Close-time for — Dumfries, 54,069–70, 54,353–67, 54,522–5, 54,539–44; Morecambe, 54,603, 54,733–7, 54,781–4, 54,857–9, 54,875–9, 54,927–32.
Injurious — Dumfries, 53,845–66, 53,905–6, 53,990, 54,190–6, 54,302–11; Morecambe, 54,615–22, 54,859–65; Fleetwood, 55,436–42; Liverpool, 55,587, 55,729–33, 55,844–62, 56,044–8, 56,190, 56,233–4.
Not injurious — Dumfries, 54,550–63; Morecambe, 54,698, 54,789, 54,951, 54,955; Fleetwood, 55,086.
Season for—Dumfries, 53,903.
Objections to limitation of — Morecambe, 54,733–7, 54,917.
Proposal for gradual abolition of—Fleetwood, 55,445–64.

Weirs for Fishing:—
Carnarvon, 56,469–70, 56,485–8; Swansea, 57,432–56, 57,476–95, 57,530–6, 57,931.
Destructive—Swansea, 57,237–59*a*, 57,333–7, 57,339–86, 57,416, 57,558–66, 57,687–705, 57,755–61, 57,767–74, 57,807–10, 57,986.
Not destructive—Swansea, 57,523–9.
Kinds of fish caught by—Swansea, 57,458–60, 57,585–89.
Decrease in fish caught by—Swansea, 57,387, 57,498–503, 57,753–4, 57,928.
Possibility of rendering weirs less destructive—Swansea, 57,577, 57,713–5, 57,789–90.
Not profitable — Swansea, 57,469, 57,568–71, 57,810, 57,818, 57,986.
Large take by—Swansea, 57,513–6.
Ought to be abolished—Swansea, 57,517–20, 57,706–7, 57,791–3.
Expense of—Swansea, 57,504–5, 57,507–10.

Wyke Regis:—
Breakwater injures fishery, 20,155–7, 20,315–20, 20,352, 20,431–2, 20,437–9.
Wrecks interfere with fishery, 20,262–8, 20,329–36, 20,471–3.
Private fishing grounds should be opened, 20,512–9.
